Major administrative accomplishments and public service improvements during the year included a revised method of presentation of patent briefs in the *Official Gazette*, grouping the patents issued weekly into major classifications dealing with general and mechanical, chemical, and electrical subjects, rather than the random system of numbering patents as heretofore. The *Roster of Attorneys and Agents Registered to Practice before the U.S. Patent Office* was revised under date of May 1, 1952. The *Rules of Practice in Trade-Mark Cases with Forms and Statutes* was revised as a third edition dated May 1952, and a second revision of the loose-leaf *Manual of Patent Examining Procedure* was issued in Dec. 1951.

Final disposition, except for cases on appeal in court, was made of all applications by veterans for extension of the terms of patents under the Veterans Patent Extension Act of June 30, 1950. Of 151 complete applications for extension, 107 were granted, 37 refused (some of which were appealed) and 7 abandoned.

Legislation enacted by congress during the 2nd session of the 82nd congress of interest in connection with patents included the revision, codification and enactment into law of Title 35,

entitled "Patents," of the United States code, public law 593, approved July 19, 1952.

Abstracts of abandoned patent applications published in the *Official Gazette* during the year ending June 30, 1952, pursuant to a commissioner's notice dated Jan. 25, 1949, totalled 261.

Net receipts for the fiscal year ended June 30, 1952, were \$5,360,818.13. Obligations incurred under all patent office appropriations amounted to \$12,219,338.01 compared with \$11,248,338.58 for the preceding year. (J. A. ML.)

Paz Estenssoro, Víctor (1907—), Bolivian president, was born on Oct. 2 at Tarija, Bolivia, and received his law degree from the University of San Andrés at La Paz in 1927. He was an attorney with the Bolivian permanent fiscal commission in 1932, and in that same year became senior official of the ministry of finance. In 1939 he was appointed professor of economics at the University of San Andrés. He served as representative for Tarija in the national chamber of deputies from 1940 to 1943 and was vice-president of the chamber in 1940–41.

Paz Estenssoro was leader of the Nationalist Revolutionary Movement (M.N.R.) when this organization overthrew the Bolivian government on Dec. 20, 1943, and installed Gualberto Villarroel as president. Paz himself became minister of finance. The M.N.R., a leftist-nationalist group, was overthrown by a revolt in July 1946; Villarroel was assassinated and Paz went into exile. During the next five years he led the M.N.R. from outside the country, and in 1951 he became a legal candidate for president of Bolivia, conducting his campaign from Argentina. In elections held May 6, 1951, he received more votes than any other candidate but fell short of the majority required by the Bolivian constitution. A military junta thereupon took control, under the leadership of Gen. Hugo Ballivián.

Paz led another revolt which succeeded in ousting the junta April 9–11, 1952; he returned to La Paz on April 15 and was sworn in as president the next day. In his first public pronouncement he promised nationalization of Bolivia's important tin industry, which was later carried out.

Peaches: see FRUIT.

Peanuts. The 1952 U.S. crop of picked and threshed peanuts was 1,225,145,000 lb., 27% less than the 1,676,000,000 lb. of 1951 and 40% less than the ten-year average. Area devoted to the crop was 1,665,000 ac., 83% of the 1951 acreage and much lower compared with the 2,940,000 ac. average for 1941–50. Yields also declined, to 736 lb. per acre, compared with 831 lb. in 1951, but the average for the previous decade was only 708 lb. Georgia was the leading producer (402,000,000 lb.) as in former years, with North Carolina second (248,750,000 lb.). In general, the crop was a very good one in the Virginia-Carolina area with an indicated yield of 1,345 lb. per acre, compared with 1,426 lb. in 1951 and a 1,144-lb. average for 1941–50.

The price at harvest time averaged about 11 cents per pound to farmers. Prices to farmers were supported at 12 cents per pound (\$239.40 per ton) for production on allotted acres, one-half cent higher than for the 1951 crop. It was indicated that

U.S. Peanut Production by Leading States

State	(In thousands of pounds)		
	Indicated 1952	1951	Average 1941–50
Georgia	402,000	595,800	698,300
North Carolina	248,750	315,210	299,494
Virginia	179,950	236,800	188,724
Alabama	179,200	205,620	319,829
Texas	90,500	118,300	317,066
Florida	51,150	62,640	64,016
Oklahoma	50,000	114,400	106,496

the small crop would bring the producers about \$160,000,000 compared with \$250,000,000 for the peak 1946 crop. The peanut support program, which cost an estimated \$40,000,000 in 1950 and \$14,000,000 in 1951, was changed by tightening legislation in March, limiting price support benefits to farmers holding plantings to acreage allotments under the program. Previously the crop from excess planting had been sold for crushing or oil without penalty.

Reports from other major producing areas indicated that the 1952 peanut harvest, though not a small one, might fall below the large crops of 1950 and 1951. Prices declined and peanut imports into western Europe declined, but peanut oil imports increased. India continued to control exports of the oil. Exports of peanut oil from the United States in 1951-52 were 54,577,000 lb., valued at \$10,184,000, compared with 31,546,000 lb. and \$7,301,000 in 1950-51. Peanut exports, however, were only 10,901,000 lb., valued at \$1,829,000 in 1951-52, compared with 14,049,000 lb. and \$6,097,000 in 1950-51. (J. K. R.)

Pears: see FRUIT.

Pearson, Lester Bowles (1897-), Canadian government official, was born April 23 at Toronto, Ont. After serving in World War I, he graduated from the University of Toronto, attended Oxford university, and returned to Toronto as history lecturer. In 1928 he left the academic world and joined the Canadian diplomatic service as a first secretary in the department of external affairs. By 1941 he had become assistant undersecretary of state for external affairs; by 1942 minister-counsellor at the Canadian legation in Washington, D.C.; by 1946 undersecretary of state for external affairs. In 1948 he joined the cabinet as secretary of state for external affairs and won the seat of Algoma East (Ont.) in the house of commons.

Pearson led the Canadian delegation to the United Nations general assembly in 1949, and was elected chairman of the U.N. political and security committee. In 1951 he explained Canada's position regarding Korea to the U.N. general assembly, and outlined Canada's reaction to the disarmament proposals; he attended meetings of the North Atlantic treaty council, being chairman at the meeting in Rome. In 1952 he attended the North Atlantic treaty council meeting in Lisbon and later turned over the chairmanship to O. B. Kraft of Denmark. On Oct. 14 he was elected president of the U.N. general assembly. (C. Cy.)

GREATER PITTSBURGH AIRPORT, second largest commercial airport in the world at the time of its dedication in May 1952; it is about 14 mi. from downtown Pittsburgh

Pennsylvania. A middle Atlantic state and one of the 13 original states of the union, Pennsylvania is popularly known as the "Keystone state." Area: 45,333 sq.mi., including 288 sq.mi of inland waters. Pop. (U.S. census, 1950): 10,498,012. Capital: Harrisburg (89,554). Cities with a population greater than 75,000 in 1950: Philadelphia (2,071,605); Pittsburgh (676,806); Erie (130,803); Scranton (125,536); Reading (109,320); Allentown (106,756); Altoona (77,177); Wilkes-Barre (76,826). The urban population in 1950 numbered 7,403,036, and the rural 3,094,976.

History.—The year 1952 was a period of intense industrial activity in the commonwealth and was particularly marked by the expansion of manufacturing facilities, an extensive program of public construction of highways and hospitals and the improvement of the state's water resources. The large agricultural area north of Philadelphia along the Delaware river, adjacent to the new 3,800-ac. steel plant, was being transformed into an urban community with a rapidly expanding population.

Between Oct. 30, 1950, and July 1, 1952, the Defense Production administration listed \$1,764,474,000 in approved defense plant construction by companies in Pennsylvania. Programs of municipal redevelopment were carried forward in a number of Pennsylvania cities during the year. An extension of the Pennsylvania turnpike of more than 30 mi. eastward to the Delaware river was being undertaken to provide a connection with the New Jersey turnpike.

Citizen committees appointed by Gov. John S. Fine were active in studying the state tax structure and the possibility for improvement in the organization of the state government in the interest of increased efficiency and economy of operation.

The state's chief officers in 1952 were: John S. Fine, governor; C. Lloyd Wood, lieutenant governor; William S. Livenood, secretary of internal affairs; Weldon B. Heyburn, auditor general; Charles R. Barber, treasurer; Robert E. Woodside, attorney general; Francis B. Haas, superintendent of public instruction; and James B. Drew, chief justice.

Education.—Statistics for 1950-51, the latest year for which complete figures were available, showed a net enrolment of 1,577,888 pupils in the public schools of Pennsylvania, including 61,005 in the kindergarten, 948,789 in the elementary division and 568,094 in the secondary schools. There were 1,023 kindergarten teachers, 30,748 elementary teachers, 24,767 giving instruction in the high schools, 1,344 elementary principals, 900 secondary principals, 1,908 supervising officials and 1,588 other professional employees. The total expenditure, including current expenses, capital outlay and debt service was \$392,658,271, of which \$320,902,830 was for current expenses. School districts supplied 60.8% of their receipts from local taxation, while the state government contributed 37.8%, and the federal government an estimated 1.4% for current operating expenses.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the first eight months of 1952, expenditures by the department of public assistance totalled \$76,500,000, including \$43,400,000 of state funds and \$33,100,000 of federal funds. The assistance rolls contained an average of 72,500 old-age assistance cases, 30,300 cases receiving aid to dependent children, 19,400 general assistance cases, 15,500 blind pensioners, and 9,400 cases receiving aid to the permanently and totally disabled.

Eight institutions comprised the state penal and correctional system, for the support of which a biennial appropriation of \$16,163,000 was made for 1951-53. For the operation of the state mental hospital system comprising 21 institutions, an appropriation of \$83,385,000 was made. An appropriation of \$10,045,000 was made for the biennium for the operation of the ten general hospitals comprising the state general hospital system.

Communications.—Of the approximately 100,000 mi. of highways in Pennsylvania in 1952, 41,000 mi. were on the state highway system under the supervision of the department of highways. Included in this state highway total were 655 mi. in the cities of Pennsylvania and 2,204 mi. in the boroughs. As of Dec. 31, 1952, more than 40,000 mi. were of improved type, leaving less than 1,000 mi. unimproved. In addition, there were 327 mi. of superhighway operated by the Pennsylvania turnpike commission. During the fiscal year ending May 31, 1952, 2,365 mi. of new construction and improvement had taken place in the state highway system.

Banking and Finance.—As of June 30, 1952, there were 344 state banks, including 8 savings banks, with assets of \$5,915,500,759.65. These state banks had total deposits of \$5,318,526,833.09. In addition, there were as of Dec. 31, 1951, 772 building and loan associations with assets of \$645,477,790.25. As of June 30, 1952, there were 613 national banks located in Pennsylvania, with assets of \$7,835,982,000. The deposits of these national banks totalled \$7,019,389,000.

The total of appropriations made by the general assembly from the general fund and approved by the governor was \$890,761,785.06. Appropriations and allocations from the motor licence fund for the biennium ending May 31, 1953, totalled \$363,867,314. The estimated receipts from the motor licence fund were \$316,643,400. The gross debt Aug. 1, 1952, was \$483,500,000, which cash and securities in the sinking fund reduced to a net of \$470,590,320.

Agriculture.—The total gross farm income for 1951 was \$842,691,000, including \$836,265,000 in cash receipts from farm marketings and \$6,426,000 in federal payments. The receipts from farm marketings were divided as follows: livestock and livestock products \$643,580,000, and crops \$192,685,000.

Manufacturing and Mining.—In 1951 there were 21,099 manufacturing establishments in the state, employing 1,808,050 persons to whom \$6,041,990,000 was paid in wages and salaries. The capital invested was

Table III.—Mineral Production of Pennsylvania

(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Cement (bbl.)	39,451,000	\$94,604,000	36,905,000	\$84,839,000

Other minerals	2,996,000	...	2,464,000
Total		\$1,186,212,000		\$1,035,970

*Values for processed materials are not included in the totals.

†Value included with other minerals.

\$6,572,597,800 and the value of the goods produced was \$23,097,663,200. Included as part of the latter amount, value added by manufacture was \$9,491,648,200. The value of the products of the principal industries for 1940 and 1951 is shown in Table II.

(J. S. Fe.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Pennsylvania in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Pennsylvania ranks first among the states in the production of cement, stone and slate, and second in clays, coal and lime, and stands second in the value of mineral output, with 10.01% of the U.S. total.

Perón, Juan Domingo (1895—), president of Argentina, was born on Oct. 8 near Lobos, south of Buenos Aires, and was educated in military schools. He became one of the leaders of the G.O.U. (Grupo de Oficiales Unidos), a nationalist clique of young army officers who in 1943 helped overthrow the regime of Pres. Ramón S. Castillo. Perón became war minister and later vice-president under Pres. Edelmiro Farrell, and in 1946 was himself elected president on the Labour party ticket. In 1949 a constitutional change was accomplished which would permit Perón to succeed himself, and in July of that year he was renominated.

A feature of his regime in 1951 was the stifling of the independent newspaper *La Prensa*, and the seizure of its plant by the government. U.S. Asst. Secy. of State Edward G. Miller, Jr., told Perón on March 4 that his policies had so antagonized the U.S. public that it was difficult for the U.S. to co-operate with Argentina. On Aug. 22 Perón "agreed" to run for re-election as president, and on Nov. 13, 1951, he was re-elected by a 2-to-1 majority.

Perón was inaugurated on June 4, 1952, for his second term as president (1952-58). Overshadowing all other events of the year, however, was the death of his wife, Eva. There was much speculation about the effect her death might have on his political career, and about the amount of influence she had exerted on him as president. Perón announced that he would personally take over many of her activities, including leadership of the women's division of the Peronista party.

Persia: see IRAN.

Peru. A republic situated on the west coast of South America and bounded on the north by Ecuador and Colombia, on the east by Brazil and Bolivia, on the south by Chile and on the west by the Pacific ocean, Peru has an area of 482,258 sq.mi. The population, 8,405,000 according to preliminary figures of the 1950 census of the Americas, is composed approximately of 52% "white" and mestizo and 46% Indian; there are also some Negro and Asiatic elements to the extent of about 2%. Lima, the capital, has a population of about 1,000,000, including its suburbs. The population estimates for other major cities are: Callao, 100,000; Arequipa, 85,000; Cuzco, 45,000; Trujillo, 40,000; Iquitos, 38,000; Chiclayo, 35,000; Huancayo, 35,000; Ica, 25,000; and Piura, 22,000. Language: Spanish, although Quechua is still spoken by some of the highland Indians; religion: predominantly Roman Catholic. President in 1952: Gen. Manuel Odría.

History.—As the Odría administration continued to stress economic and fiscal reforms, the emphasis was placed during 1952 on public works projects. Major construction programs were already under way by the middle of the year, when a new

127,000,000 enterprise was announced. This undertaking involved the building and maintenance of new highways, and the expenditures were projected over a six-year period. Meanwhile, plans went forward for the modernization of the Peruvian navy within the over-all structure of the defense system of the western hemisphere. Three U.S.-built destroyers were commissioned on May 24, which doubled the effective surface strength of the Peruvian fleet. (See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.) (G. I. B.)

Education.—In 1951 there were 9,705 public primary schools with 20,429 teachers and 872,669 pupils and 628 private schools with 2,650 teachers and 85,429 pupils. The 98 public secondary schools had 2,056 teachers and 41,209 students. There were also 148 private secondary schools, some of which were conducted by religious orders, with 1,736 teachers and 1,023 students. University education was available at four public universities—Lima, Arequipa, Trujillo and Cuzco—and the Catholic university of Lima. Appropriations for education in 1952 comprised 13% of estimated governmental expenditures.

Finance.—The monetary unit is the sol, valued at 6.45 cents U.S. currency, free rate, on Aug. 16, 1952. The 1952 budget estimated ordinary expenditure at 2,025,640,000 soles and extraordinary expenditure at 538,272,250 soles. Actual revenue in 1951 was 2,151,264,882 soles; expenditure, 1,979,936,932 soles. The direct public debt on Dec. 31, 1951, totalled 1,605,483,221 soles, made up as follows: external dollar and sterling debt (including accrued interest) 375,044,578 soles; internal consolidated debt 545,327,004 soles; internal floating and short-term debt 685,111,399 soles. On July 31, 1952, currency in circulation totalled 1,214,000,000 soles; demand deposits 2,038,000,000 soles; gold reserves \$45,700,000; foreign exchange reserves \$14,600,000.

Trade and Communications.—Exports in 1951 totalled 3,740,619,000 soles; imports, 4,238,597,000 soles. Leading exports in 1951 were cotton (33%), sugar and derivatives (13%), petroleum and products (8%), lead and zinc; leading imports, machinery and vehicles (33%), metals and manufactures (12%), chemicals and products (8%), cereals (7%) and textiles (7%).

Railways (1947) totalled 2,612 mi., of which 511 mi. were state-owned. Roads used by motor traffic on Dec. 31, 1949, totalled 19,468 mi., of which 7,903 mi. were hard-surfaced. Motor vehicles (1950) included 1,945 automobiles, 23,978 trucks and 3,459 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 44 steamers and motorships (100 tons and over) aggregating 91,167 gross tons on June 30, 1951.

Agriculture.—Production figures in 1951 included cotton (ginned) 80,445 metric tons; centrifugal sugar 467,000 tons; and rice (paddy) 215,000 tons. In 1951 (Jan.-Nov.) 58,387 metric tons of cotton and 236,965 tons of sugar and derivatives were exported. Livestock estimates (1950-51) showed 19,000,000 sheep, 1,100,000 pigs, (1949-50) 1,092,000 goats, 2,500,000 cattle and (1948) 2,449,746 alpacas and llamas.

Mineral Production.—Production of the principal minerals in 1951 was as follows: copper (smelter) 25,170 short tons; lead 90,774 tons; zinc (ore) 111,663 tons; gold 144,367 fine oz.; silver 14,856,194 oz.; antimony 1,115 metric tons. Crude petroleum production totalled 16,109,896 bbl.; natural gasoline 1,089,853 bbl. (J. W. Mw.)

Petroleum. The Iranian oil impasse and the filing of suits against United States oil companies engaged in foreign operations for allegedly overcharging the Economic Cooperation administration and the Mutual Security agency for middle east oil delivered to Marshall plan countries in Europe, highlighted the developments of 1952. The federal government entered three suits in August to recover \$67,000,000 from Standard Oil company (New Jersey), Standard Oil Company of California, the Texas company and Socony-Vacuum Oil Company, Inc. The government termed these suits part of a broad

effort to break up "international oil cartels." At the same time a federal grand jury in Washington was investigating allegations of world-wide monopolies in oil, and a Federal Trade commission report, long held from the public for "security reasons," was released to the effect that these same companies, as well as the American Gulf Oil corporation, the British Anglo-Iranian Oil company and the British-Dutch Royal Dutch-Shell company, were combined in a monopoly to divide up world markets.

Categorical denials of the overcharging, cartel and world monopoly allegations were made by the accused companies. It was brought out that the price controversy was a technical matter that had long been under discussion and negotiation between the government and the companies. The Marshall aid plan was calculated, so far as oil was concerned, to provide money for building refineries abroad and for buying oil and petroleum products abroad—preferably in the middle east—so as to relieve the United States and South America of drain as much as possible and conserve western hemisphere oil reserves—a project into which the United States oil companies entered wholeheartedly. When in 1951 the shutdown of oil production in

Iran suddenly cut middle east production by more than half at a critical time in the NATO (North Atlantic Treaty organization) and U.S. defense programs, these companies by having built up large crude oil production and reserves and refinery capacity in the middle east and elsewhere abroad were able almost single-handed to make up the deficit of 1,950,000 bbl. daily that menaced the west's defense plans and threatened to place a heavy burden on western hemisphere supply and reserves.

The year 1952 saw, despite a strike in the United States that paralyzed the industry for several weeks, a continued increase in domestic demand—a daily average gain of 74,000 bbl. for the first nine months compared with the corresponding period of 1951, and even a slight increase in domestic production for the period.

(L. M. F.)

Philadelphia. In 1952 the population of Philadelphia was approximately 2,100,000, calculated on the basis of a net surplus of 39,639 births over deaths during the previous two years and, possibly, a slight out-migration to the suburbs since the national census enumeration of 2,071,605 for April 1, 1950. The population of the entire eight-county Philadelphia metropolitan area was 3,671,048 in 1950, and was believed to have increased by at least 100,000 since that date.

Building construction remained active, with single-family

structures predominating in the residential field. However, several very large apartment developments indicated a continuing trend toward more multiple-dwelling units. In the commercial field, adjustment of shopping facilities to the needs of automotive travel was evidenced by new shopping centres with adequate parking space, addition of parking space adjacent to older commercial areas and at points convenient to rapid transit lines and further establishment of branch stores by centrally located business houses. While industrial expansion continued within the city, this was overshadowed by near completion of a large steel mill to the northeast of the city. According to figures compiled by the Chamber of Commerce of Greater Philadelphia, more than \$1,000,000,000 would have been spent on industrial construction in this area during the decade 1945-55.

The administration of Philadelphia during 1952 was Democratic; the mayor, Joseph S. Clark, Jr.

Reorganization of the city government in accordance with the new home rule charter, which became effective on Jan. 7, 1952, constituted a major undertaking of the new administration. Under the new charter, the mayor continued as the chief administrative officer but was assisted in the field of ceremonial and public relations activities by a city representative, in the administrative field by a managing director under whom nine departments were grouped, and in the field of municipal finance by a director of finance. The council, the legislative branch, was reduced from 22 members to 17, of whom 10 were district councilmen and 7 were councilmen at large.

Substantial progress was made on the construction of public improvements. The Charles K. Mills neurology building, a \$7,600,000 structure, was placed in operation; three new district health centres were completed and a fourth opened for service. Five new fire stations, three police stations, a combined police and fire station and a station for fireboats were added to the facilities of the police and fire services at a cost of \$1,900,000.

A youth study centre was constructed at a cost of \$2,700,000 for the detention and study of juvenile delinquents. Construction proceeded on two additional sewage treatment plants to cost \$13,000,000 and on the extensive system of intercepting sewers. In south Philadelphia a new incinerator was built at a cost of \$1,300,000.

A major undertaking of the new administration was a review of the improvement programs of the various services to increase effectiveness without overburdening the city's financial resources.

(J. S. Ck.)

Philanthropy: see DONATIONS AND BEQUESTS.

Philately. During 1952 the United States issued ten commemorative stamps up to Sept. 15; three others were scheduled for the rest of the year, plus an air-mail issue. The number of new stamps issued by other American republics during the first eight months of the year was as follows:

	Regular	Air Mail
Argentina	0	0
Bolivia	6	6
Brazil	2	0
Chile	1	1
Colombia	0	10
Costa Rica	0	8
Cuba	4	1
Dominican Republic	0	0
Ecuador	5	6
Guatemala	0	0
Haiti	0	0
Honduras	0	0
Mexico	4	2
Nicaragua	0	0
Panamá	0	0
Paraguay	7	8
Peru	0	0
Salvador	6	8
Uruguay	12	4
Venezuela	0	3

COMMEMORATIVE three-cent stamp issued by the U.S. post office department in 1952 on the 500th anniversary of the printing of the Gutenberg Bible, the first book printed from movable type

New Issues.—The United States stamps were the Betsy Ross (carmine rose; Jan. 2); the 4-H clubs (blue green); the 125th anniversary of the Baltimore and Ohio charter (blue); the 50th anniversary of the founding of the American Automobile association (deep blue); the marquis de La Fayette (blue); the 5th anniversary of the North Atlantic Treaty organization (deep violet); the Grand Coulee dam (green); the Mt. Rushmore, Dakota (green); the 100th anniversary of the American Society of Civil Engineers; and the Women in the Armed Forces. All these were three-cent values. The three others scheduled for issue, also of three-cent value, were to honour the Gutenberg Bible, the newsboys and the International Red Cross. The air mail was an 80-cent value, for big packages. It had a view of Diamond Head, Hawaii.

The death of George VI meant that the entire British Commonwealth would have new stamps, with Queen Elizabeth II portrayed. The first were announced in August, and by the time of the coronation in June 1953 it was expected that all would be ready.

Exhibitions.—The 1952 exhibitions of the American Philatelic society and the Society of Philatelic Americans were held, respectively, in Philadelphia, Pa., and New York, N.Y. (See also POST OFFICE.)

BIBLIOGRAPHY.—The various catalogues—Scott in the U.S., Gibbons in Great Britain, Yvert & Tellier in France—appeared in the fall of 1952, bearing the 1953 imprint. Following the example of Gibbons, which publishes a "simplified" edition listing only types, not varieties, Scott published a "popular" edition. (M. H.A.)

Philippines, Republic of the. This republic, situated in the western Pacific ocean east of Indochina, comprises an archipelago composed of 7,083 islands, totalling 115,600 sq.mi. The 1948 population census totalled 19,234,182, and the 1952 population was estimated at 21,400,000. The chief city is Manila, whose metropolitan area held about 1,350,000 persons in 1952. The capital is officially designated as Quezon City, a suburb of metropolitan Manila, though the president's executive mansion and many national government offices remain in Manila proper. Other large cities in 1948 were Cebu (167,000) and Iloilo (110,000). In April 1952, the official record indicated 145,720 Chinese resident in the Philippines. On the same date there were 11,754 U.S. citizens and about 8,200 other aliens living in the islands. Most Filipinos are Catholic in religion (Roman Catholic or native Aglipayan Catholic). In the southern islands live about 800,000 Mohammedans, termed Moros, while approximately 425,000 Protestants and almost 700,000 pagans are widely scattered. President in 1952: Elpidio Quirino.

History.—During 1952 the political and economic situation of the Philippines continued to improve. The election of Nov. 1951 placed control of the Philippine senate in the hands of

the opposition, Nacionalista party, headed by Sen. José P. Laurel, and 1952 was marked by much political jockeying of the two major parties, Liberal (conservative) and Nacionalista, for control of congress, but no major splits or problems endangered the operation of government. President Quirino's emergency powers were cancelled by congress in February.

The vigorous military campaign against the Communist Hukbalahap begun in 1951, combined with issues of land to surrendering dissidents, led to claims that the serious Communist threat to the islands was ended. Small groups of Hukbalahap remained scattered throughout the main island of Luzon, but the double-barrelled program reduced the number and strength of the Communist forces, and raised the confidence of the population in its government.

The small trickle of migrants in past years, moving from the overcrowded central and northern islands into the relatively empty southern frontier island of Mindanao, increased during the year to the point where more than 20,000 people per month were entering Mindanao, settling chiefly in the two southern provinces of Davao and Cotabato.

Education.—During 1952 government appropriations for education ranked second to those for national defense. There were about 19,200 government-supported schools and colleges, with almost 5,000,000 students enrolled. A number of new agricultural high schools were opened during the year. In addition there were about 2,200 private schools and colleges, with about 500,000 students enrolled.

Finance.—Tax revenues increased during 1952 and permitted the formulation of a balanced budget for the fiscal year 1952-53. This budget estimated government income at U.S. \$298,888,000, with expenditures planned for a slightly lower figure. Significant expenditure allocations were: national defense 32%; education, which is nationally administered, 25%; agricultural and economic development 10%, which was a marked increase over previous budgetary allocations in this field. This budget allowed partial liquidation of deficits of previous years.

Agriculture, Trade and Industry.—The rehabilitation of Philippine economy, after the serious impact of World War II, was almost completed during 1952. Physical productivity exceeded prewar levels in most lines, and per-capita production about reached prewar levels, compensating for the increased population. Total land in crops for 1952 approximated 13,300,000 ac., compared with 12,530,000 in 1940. Acreage and production of food crops both stood higher than in 1940. Rice, the chief crop, was grown on about 5,540,000 ac. in 1952, compared with 5,137,000 in 1940, but production still fell short of consumption needs by roughly the same figure as in 1940. Acreage and production of export crops fell below 1940; sugar, tobacco and manila hemp being below and coconut above the 1940 figures. The animal and fowl population had increased to the point that meat and poultry foods approximated the prewar volume. The fisheries yield was greatly enlarged in 1952 and almost supplied domestic requirements.

The 1952 production of gold and copper lagged behind prewar production, but base metal production of chromite, manganese and iron was well above prewar averages. Production of domestic industrial products such as cement, textiles, toilet goods, tobacco products and lumber were well above prewar levels.

United States aid, through the Mutual Security administration, helped provide both technical assistance and money to import and distribute fertilizers, improve irrigation, stimulate rural industry and develop power sources to augment all productive aspects of the economy.

The road rehabilitation program of the U.S. bureau of public roads was completed in June, at which time the road system totalled 17,900 mi., of which about 85% were all weather roads.

The average agricultural wage, with regional variations, barely exceeded the new minimum wage law level of 87 cents per day, though industrial wages considerably exceeded the minimum level of \$2 per day. Both wage rates were trending upward slowly, but there was much difficulty over enforcement. Agricultural wages averaged about three times prewar wages, and industrial wages were slightly more than three times prewar levels. The cost-of-living index for Manila ranged from 355.1 in January to a low of 342.2 in May, compared with a 1941 base of 100, and then slowly rose during the latter part of the year.

The foreign trade balance was unfavourable during early 1952, with imports rising and exports not keeping pace, continuing the trend of late 1951. Import controls were tightened for the last half of the year. Exports by rank during the first half of 1952 were: coconut products, sugar, manila hemp, logs and lumber, iron ore, tobacco products, embroideries, pineapple and chromite. Ranking imports were: cotton products, petroleum, automotive equipment, machinery, grain foods, synthetic textiles, paper products, iron and steel, tobacco products and dairy products. The total value of exports for the first half of the year was \$188,300,000, whereas the value of imports was \$218,442,000. This unfavourable balance was offset by U.S. government expenditures so that total receipts were larger than disbursements. The international currency reserve remained fairly stable and on July 29 stood at U.S. \$304,100,000. The money supply at the end of June totalled U.S. \$566,250,000. The outstanding public debt on March 31 totalled U.S. \$400,155,000, a significant reduction from the figure of a year earlier. (J. E. Sp.)

Philosophy. There were no significant changes in the direction of philosophic activity during 1952 ex-

cept for an increase in philosophical scholarship that was reflected in a more widespread concern for the classics and a more intensified research in the history of ideas. There were numerous translations and reissues of earlier scholarly works. A complete French edition of the works of Étienne Bonnot de Condillac, edited by G. LeRoy, appeared as the first volumes of a *Corpus General Des Philosophes Français*, sponsored by the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.). The sixth edition of the monumental *Die Fragmente der Vorsokratiker* of Hermann Diels was a welcome addition to the instruments for classical research. "The Great Ideas," edited by Mortimer J. Adler, was published as a synoptic of "Great Books of the Western World."

The concern for human values, moral, spiritual and intellectual as well as economic and civic, continued during 1952 to command a large share of attention and effort. The continuation of wide-scale political unrest and economic uncertainty contributed to the fear of cultural dissolution that had in recent years prompted philosophy's growing appreciation of its responsibility to the life of the individual and of society. Value philosophy was equally constructive and analytic, with a marked emphasis upon religion and the wisdom of the past, but without neglecting current affairs and the sciences, particularly psychology and the social disciplines.

The ever-present interest in freedom was evidenced by the report of the International Federation of Philosophical Societies on the investigation concerning freedom inaugurated in 1950 by U.N.E.S.C.O. The project, which had world-wide participation, was devoted to the meanings of the concept of freedom, its present effect and its importance in current ideological conflict. Richard McKeon's *Freedom and History* dealt with "the semantics of philosophical controversies and ideological conflicts."

An abundance of literature appeared in 1952 on the problems of theoretical ethics and the good life. A. MacBeath's *Experiments in Living*, the Gifford lectures for 1948-49, was an analysis of ethical foundations in terms of social anthropology. Baker Brownell's *The College and the Community* was a critical and constructive analysis of the current practice of centralization and specialization in higher education. *The Community of Man* by Hugh Miller was a biologically oriented study of social development and present institutions.

The philosophy of religion continued the familiar three-cornered argument of the naturalistic humanists, who were revolting against the charge of sponsoring a demoralizing secularism, the liberal theists, who were striving to maintain a fine balance between science and traditional religious values, and the neo-orthodox, who had reverted to the pessimistic conception of man that had long characterized fundamentalism. Among the publications in religious philosophy were *God and Nature*, the second volume of G. F. Stout's Gifford lectures of 1919 and 1921; *Time and Eternity*, an essay by W. T. Stace; Wilbur Urban's *Humanity and Deity*; and John Baillie's *Natural Science and the Spiritual Life*. Announcement was made of the intended publication in England of *The Library of Christian Classics*, a 26-volume series of Christian texts from the earliest Fathers to the English reformers.

The insurgency of naturalistic humanism was expressed in the first International Congress on Humanism and Ethical Culture, which was convened in August at Amsterdam, Neth., under the presidency of Julian Huxley. The congress was sponsored by Dutch, Austrian, British and American humanist and ethical societies in the interest of a "universal democratic and rational civilization dedicated to the dignity and worth of man."

The problem of personality in its ontological, psychological, sociological and moral aspects received much attention in 1952. Plans were advanced in the United States for a World Confer-

ence on the Person to be held in Europe in the summer of 1953. Additions to the literature of personalistic philosophy included an English translation of a posthumous work, *Personalism*, by the French philosopher Emmanuel Mounier, and *The Person*, by the American Ralph Tyler Flewelling.

In scientific philosophy subjects relating to the physical sciences continued to be the centre of interest during 1952. Methodology, theory of causation, the concept of force, the philosophical postulates of physics and the nature of scientific law represented the problems receiving prominent attention. A volume of essays by the German physicist Werner Heisenberg, *Philosophic Problems of Nuclear Science*, was a provocative analysis of methodological and speculative issues. Erwin Schroedinger's *Science and Humanism*; *Physics in Our Time*, argued that the aim of science is philosophical rather than technological. In his Bampton lectures on the subject "Modern Science and Modern Man," James B. Conant examined the cultural significance of recent science.

In logic and the philosophy of mathematics numerous technical monographs and several English translations of standard works made their appearance. Rudolf Carnap's *The Continuum of Inductive Methods* concerned one of the most persistent problems of logic, while treatises on language and the problem of meaning continued the effort to achieve a theoretical foundation for the unity of knowledge. Among translations were Georg Cantor's *Contributions to the Founding of the Theory of Transfinite Numbers*, by Philip E. B. Jourdain, and *Translations from the Philosophical Writings of Gottlob Frege*, by Peter Geach and Max Black.

The year 1952 gave evidence of an increase in the interchange of ideas on both a regional and world-wide scale. Latin America showed considerable interest in European and North American philosophy, and Italian and Latin American philosophy received more than usual attention in English-speaking countries. Buenos Aires was host to a Conference on Important Aspects of North American Philosophy, and plans were made for the fourth Inter-American Congress of Philosophy to convene in Havana, Cuba, in Jan. 1953. The usual effort to contribute to world understanding through the exchange of ideas between orient and occident continued undiminished. Foreign fellowships, teaching exchanges, conferences, translations and joint publications were much in evidence. At the close of 1951 the U.N.E.S.C.O.-sponsored Conference on the Concept of Man and the Philosophy of Education in East and West was held in India under the presidency of S. Radhakrishnan. Plans were materialized also for the tenth International Congress of Philosophy to be held in Brussels, Belg., during Aug. 1953. The 11th symposium of the Conference on Science, Philosophy and Religion was published under the title, *Foundations of World Organization*.

(S. M. Mc.)

Phosphates: see MINERAL AND METAL PRODUCTION AND PRICES.

Photography. There were few basic changes in photography during 1952. However, the applications were extended through all fields of industry and in military and civilian use. The total production of equipment and sensitized goods was about 10% more than in 1951. The United States foreign trade in still picture photographic materials increased by 25% during the first quarter over the similar period for 1951. Imports amounted to \$3,557,704 during the first 1952 quarter, with about 53% coming from Germany. Exports during this period amounted to \$7,471,746, an increase of 7% over the previous year. Exports of X-ray film showed an increase of 40% over 1951. Production of photographic goods for civilian use was maintained without shortages in spite of heavy military

demands.

New Cameras.—Graflex, Inc., made a special combat camera for the army using 70-mm. roll film in 15-ft. lengths for making $2\frac{1}{4} \times 3\frac{1}{4}$ -in. negatives. This camera had all the important features of the better 35-mm. cameras, such as interchangeable lenses, automatic film advance with shutter setting, automatic exposure counter, built-in flash contacts, focal plane shutter and a combined view finder-range finder which adjusts automatically for the different lenses. The camera makes 50 individual $2\frac{1}{4} \times 3\frac{1}{4}$ exposures on each roll, and takes as many as 10 consecutive single exposures within five seconds. Built to withstand dust, light, fungus, moisture or driving rain and rough handling, it has a magnesium body and aluminum lens mount and weighs $5\frac{1}{2}$ lb. The larger picture produced has important advantages in rapid processing and reducing the time interval between taking and delivery of the prints.

The Bolsey Camera Corporation of America produced the N-9 Combat Recording camera using 16-mm. film in 50-ft. lengths. The camera is synchronized to the firing mechanism of jet fighter planes and operates automatically when the gun starts to shoot. The resulting film records the firing pattern upon the target.

Cologne, Ger., was the scene of the Third Photokina fair from April 26 to May 4. In addition to the exhibits by leading German firms there were displays from other nations, including England, Italy and the United States, making a total of 338 exhibitors. More than 100,000 visitors from all over the world attended the nine-day exhibition.

No radically different products were shown. More new 35-mm. cameras were on display than any other camera type. Most of these were in the medium-price range without range finders, and were made by a number of new firms in the photographic field. Some of these 35-mm. cameras included the Condor II, Futura S, Akarex, Paxette, Finetta 99, Diax 1a, Ucaflex, Contina and Photovit, in addition to the old-timers such as the Leica and Contax cameras.

Zeiss Ikon AG, Stuttgart, Ger., exhibited the new Ikonflex IIa, and Ihagee Kamerawerk Aktiengesellschaft, Dresden, showed its new single-lens reflex, the 6 x 6-cm. Exacta. The only new press-type camera was the Bertram, made by E. U. W. Bertram of Munich-Pasing. This camera makes $2\frac{1}{4} \times 3\frac{1}{4}$ -in. negatives on roll film, sheet film or film packs. The built-in range finder automatically couples with a number of interchangeable lenses. Parallax compensation is automatic and the view-finder field automatically changes as different focal-length lenses are attached. The shutter is synchronized Compur-Rapid, which is cocked and released with a single button. Zeiss Ikon introduced the Movikon 8, an 8-mm. roll-type motion-picture camera which is oblong and held in the horizontal position. It operates at 16 frames per second and the lens has a maximum aperture of f/1.9.

Fotorex, St. Étienne, Fr., brought out the first $2\frac{1}{4} \times 2\frac{1}{4}$ twin-lens reflex camera with interchangeable lenses. Each lens pair, including shutter, is mounted on a metal lens board which is locked into position on the camera when in use.

During the year, Eastman Kodak company introduced the 35-mm. Kodak Retinette for the lower-priced 35-mm. camera field. Its shutter speeds range from 1 sec. to $\frac{1}{300}$ sec., delayed-action setting and built-in flash synchronization. The Fairchild Camera and Instrument company developed the CAX-12 aerial camera for use in the new high-speed jet photo planes. This new camera uses removable magazines holding up to 100 ft. of 70-mm. roll film, producing $2\frac{1}{4}$ -in. square pictures. It is designed with high-speed film movements so that the photo pilot can speed over the ground objectives, get the pictures and then rush out of anti-aircraft range much faster than with the slower cameras.

70-MM. COMBAT CAMERA developed by the U.S. signal corps, as announced in May 1952. The camera could take ten pictures in five seconds, and was impervious to dust, light, fungus, moisture or driving rain

A notable camera improvement was the introduction by the Polaroid corporation of the new Polaroid Pathfinder Land Camera Model 110, which produces a finished picture within 60 sec. The Pathfinder was designed to fit the requirements of press and commercial photographers, industrial users and advanced amateurs. This camera has a Wollensak Raptar f/4.5 5-in. lens, coupled Kalart synchronized range finder, shutter speeds from 1 sec. up to $\frac{1}{400}$ sec. and built-in synchronization for all flash lamps. The Pathfinder camera uses the standard Polaroid Type 41 picture roll with an ASA rating of 100 for producing finished prints within one minute.

Bell & Howell company had new Model 200 and 200-T 16-mm. magazine-load motion-picture cameras in production. Important features included improved view finders, a new ratchet key for quick winding of film, five speeds ranging from 16 to 64 frames per second, and the two-lens turret for the 200-T model. These cameras won the Society of Motion Picture Art Directors' award for 1952.

A new Bell & Howell magnetic recording projector, Filmosound 202, provided for a simplified sound-on-film process for the 16-mm. motion-picture photographer. This projector records and plays back magnetic sound by means of a stripe of magnetic material on the film edge. As the film is projected for the first time, sound is recorded and stored on the magnetic stripe, ready for instant playback or for future projection. To record a magnetic sound track, it is necessary to merely plug in the microphone, start the projector and describe what is seen on the screen. A service was also available for converting existing silent films into sound motion pictures.

A magnetic sound track striping service for single-perforated processed Kodak 16-mm. film was available from the Eastman Kodak company, known as Kodak Sonotrack Coating.

Stereoscopic Photography.—Stereoscopic photography was gaining new interest in the European countries, and in the United States it was increasing rapidly, with the Stereo-Realist camera outselling all others. The German 35-mm. Iloca Stereo camera was in production, and other camera manufacturers were making stereoscopic attachments for their regular 35-mm. cam-

eras. Paillard-Bolex of Switzerland showed a stereoscopic attachment for the 16-mm. motion-picture Bolex camera; projection was possible by using polaroid spectacles when viewing the screened image. The Nord company of Minneapolis, Minn., developed camera and projector converters working on the beam-splitting principle for transforming 16-mm. cameras or projectors into a three-dimensional motion-picture system. The View-Master Personal Stereo camera was another new development in the 35-mm. stereoscopic camera field.

Flash Photography.—The main developments in flash photography were in the small portable electronic flash outfits, using wet- and dry-cell batteries. Some of the new German units were the Multiblitz made by Mannesmann, the Ionenblitz by Schaufele and the Ikotron by Zeiss Ikon. In the United States, Strobo Research introduced the SR Strobflash II operated by two 225-v. dry batteries in series. The capacitors are charged directly from the dry battery, making it possible to flash the unit every three or four seconds for rapid synchronization with the camera shutter. Approximately 2,000 flashes can be obtained from one set of batteries. The guide number for fast Panchromatic film is 220 and 35 to 45 for colour film. Other new portable electronic flash units made in the United States were the Rocket 100-w.-sec. and 200-w.-sec. models made by Johnson Ventlite. The Photogenic Machine company introduced the 100-w.-sec. Little Giant. In England Clive Courtenay & Co., Ltd., made the new Master III electronic flash rated at 100-w.-sec. and powered from a wet battery which can be charged directly from a 110-v. alternating current line.

Many changes and some new units were produced for flashing the single bulb which is discarded after each flash. Sylvania produced the new Superflash FP 26 blue focal plane lamp and General Electric the No. 11B blue lamp and the No. 6B blue focal plane lamp. The Kalart company extended the applications of their improved B-C Flash Unit for use with almost every type of camera. These B-C units are powered by a small 22½-v. battery which charges a capacitor and provides a powerful surge of electrical energy to overcome circuit resistances and assure consistent synchronization. Two of the new Kalart B-C Flash Units were available for the Argus and Bolsey 35-mm. cameras.

BALLISTIC CAMERA for obtaining highly accurate trajectory data on rockets and missiles. It was used at the ballistic research laboratories, Aberdeen proving grounds, Md., in 1952, where numerous problems in rocket research were being solved by photography

Anso showed the new Anso Flash Unit at the Photographic convention in St. Louis, Mo. This unit can be attached to the European-type cameras as well as to others which have different tripod sockets.

Film.—Two new panchromatic reversal 16-mm. motion-picture films were introduced during the year by the Photo Products department of the E. I. du Pont de Nemours and Company. These films were designed to give the best pictorial and single system sound results for professional television and motion-picture use. Type 930 was an improved fine-grain film for rapid reversal processing, and type 931 was a new high-speed reversal film combining greatest picture speed with fast processing characteristics. Drastically reduced processing times were made possible through use of elevated processing temperatures which these superhardened emulsions had been designed to withstand. The two films were especially suited to reversal processing for immediate use when only one positive is required, as in coverage of local events for television and records of sporting events.

The du Pont company also announced that it had developed an entirely new type of film base, identified chemically as a polyester, being a condensation polymer obtained from ethylene glycol and terephthalic acid. The new safety-type material was extremely tough and durable and had remarkable dimensional stability. These qualities appeared to make it particularly promising for motion-picture and graphic arts film. Du Pont stated that commercial production would have to await the results of extensive field evaluation tests.

A new special loading of 35-mm. Kodachrome Film, Daylight Type, for use in stereo cameras, and a new stereo mounting service for stereo pictures was put into operation. When this special packaged film is sent to the Kodak laboratory for processing it is returned in stereo mounts ready for use in the small hand stereo viewers.

A new Kodak Ektachrome Roll Film, Type B, was available for picture taking indoors with artificial illumination including flash. It was available in eight-exposure rolls in sizes 620 and 120, and the speed rating was ASA 10 for tungsten illumination.

There was nothing basically new in colour photography for the year.

Eastman Kodak company introduced a new infra-red-sensitive 16-mm. and 35-mm. motion-picture film known as Kodak Spectroscopic I-N Film. This film, originally intended for use by spectrographic laboratories, had a total red speed greater than any other material on the market. In early tests successful motion pictures were made of audience reactions when house lights in a theatre were dimmed to one-seventieth of normal room illumination. It is also of special value in high-speed photography such as showing the flow and action of molten or hot metals.

Anso announced a new type of ultra fine-grain developer and replenisher called Finex-L. This developer gives desired film negative results without loss in film speed, which is often the case with some of the fine-grain developers.

The Polaroid company announced its new type of X-ray film for producing finished 10-in. square positive X-ray pictures within one minute after exposure. The exposure is made in the usual way, but the special Polaroid X-ray film is used instead of the conventional film. The film packet is then run through special steel rolls, the developing solution is squeezed over the surface automatically and the final print is ready. It was expected that this new-type X-ray film would revolutionize the battlefield diagnosis and treatment of wounds. Since no dark-room or special lighting is necessary, and specially trained personnel are not required to process the film, doctors would

be able to locate shell fragments and perform other types of diagnoses close behind the front lines. Other applications in hospitals include the picture-in-a-minute photography of bone operations, fractured hips and foreign bodies.

Microphotography.—New equipment in the microphotography field included improvements in the standard 16-mm. and 35-mm. flat bed and rotary cameras. New reading equipment emphasizing portability and versatility appeared on the market. These included the Griscombe Newspaper and the Griscombe Portable reading machines, the Recordak, model MPE, reader and the Lovins reading machine, all featuring opaque screens. The Diebold translucent screen reader, equipped to project sheet microfilm, was the first to appear on the U.S. market. There was also the Readex Microprint Reader and the Microcard Reader, Model 3.

Other Events.—The World Exhibition of Photography at Lucerne, Switz., was held to demonstrate the high commercial, scientific and cultural importance of the photographic picture and to accentuate its specific technical and artistic development. This exhibition contained photographs from many nations of the world, including Finland, France, Great Britain, Guatemala, Japan, Italy, Israel, Austria, Spain, the Netherlands, the Union of South Africa, Germany and the United States.

Attendance at and membership in camera clubs throughout the United States dropped during 1952, a situation blamed to some extent upon the popularity of television. The International exhibition of the Photographic Society of America was held at New York city, Aug. 12-16, with sections devoted to colour slides and prints, motion pictures, nature, photo-journalism, pictorialism, stereo and technical. At the society's 1952 convention, held at the same time, 86 photographers and photographic technicians were honoured with fellowships and associateships. During nine sessions of the technical division, 45 papers were presented. (See also MOTION PICTURES; MUNITIONS OF WAR; NEWSPAPERS AND MAGAZINES; X-RAY AND RADIOLOGY.)

(W. D. MN.)

Physics. Nuclear Physics.—In May 1952 the builders of the new giant cyclotron (or "cosmotron" as it had come to be called) at the Brookhaven National laboratory, Upton, N.Y., accelerated protons to an energy of 2,000,000,000 e.v., thereby achieving a severalfold increase over the peak energy of the previous record holder, the giant University of Chicago accelerator. Thus, in the space of about 20 years, since E. O. Lawrence accelerated particles to energies of about 1,000,000 ev with his first cyclotron, a thousandfold increase had been reached in elementary particle acceleration. But there was hardly a pause for rest in the climb toward higher energies. In September E. D. Courant, M. S. Livingston and H. S. Snyder, all working at Brookhaven, announced the discovery of a new arrangement of the magnets which keep particles in a path as they are being accelerated. The discovery gave promise that the focusing of the particles could be much more efficiently achieved than in the cosmotron and other accelerators, with the result that with approximately the same amount of material as was used in the cosmotron, an accelerator that would accelerate particles to 50,000,000,000 ev could be constructed. Accordingly, plans were begun for such an instrument. With the prospect of energies in the multibillion-ev range, physicists looked forward to reactions in which protons and neutrons are formed, just as electron-positron pairs and mesons were formed with energies from the accelerators actually operating in 1952.

In April, by agreement among the governments of the United States, the United Kingdom and Canada, important data necessary for the understanding and development of low-energy nuclear reactors were released. Such values as the constants that

PHOTOGRAPH of the screen of an oscilloscope at Brookhaven National laboratory, Upton, N.Y., showing atomic particles accelerated to 1,300,000,000 v. by the laboratory's cosmotron, May 20, 1952. The trace indicates the beam intensity as it was being accelerated in the magnet gap

indicate the fission and neutron capture properties of uranium isotopes were included. One remarkable measured value that was made public was the one that indicated the tendency of the isotope xenon 136 to capture slow neutrons. The ability of a nucleus to take up neutrons is expressed in terms of the "capture cross-section," and is of the order of tens, in appropriate units, for most nucleuses, but for xenon 136 the number is the astonishingly large one of 3,500,000.

The Atomic Energy commission made public the details of a relatively simple low-power (ten kilowatts) nuclear pile, known as the "swimming pool reactor." Instead of being surrounded by massive concrete walls, which shield operators from the penetrating radiations formed in a pile, the unit is submerged in a tank of water of about the same dimensions as an ordinary indoor swimming pool. The water acts as an effective shield and test samples may be given radiation of varying intensities by being placed in the water at various distances from the pile. The cost of the entire installation was less than \$250,000; the feasibility of a comparatively inexpensive nuclear pile for research purposes was thereby indicated.

D. A. Glaser of the University of Michigan, Ann Arbor, reported his work on the development of a liquid detector for the paths of elementary particles, analogous to the Wilson cloud chamber that had been since the early years of the century perhaps the primary tool of the atomic and nuclear physicist. In the cloud chamber the path of a charged particle, as an electron or proton, is made visible because of the condensation of liquid droplets on the ions produced by the particle along its path. Glaser used superheated liquids and proposed that the path of the particle would become visible because of the vapour droplets that would form on the path ions, somewhat as droplets form in a freshly poured glass of a carbonated beverage. A liquid detector would be desirable for very high energy particles compared with a cloud chamber, because the paths of the particles would be much shorter in liquids, with their dense packing of molecules, than in gases.

The Neutrino.—Among nature's most elusive entities is the one named "neutrino." The principle of the conservation of energy is a keystone of physics; but some radioactive decay processes do not give masses and energies that add up to a final energy equal to the original energy, unless a hypothetical particle, the neutrino, is assumed to carry off energy in the decay process. Although the neutrino had been called into existence about 20 years previously on the basis of nothing more than a faith in the energy conservation principle, various evi-

dences for its existence had been accumulating, and two important new observations relating to the neutrino were reported during the year, by J. S. Allen and collaborators of the University of Illinois, Urbana, and Raymond Davis, Jr., of the Brookhaven National laboratory.

No one expected to see a neutrino, or even a path showing its passage through matter, as with an electron or proton. But a direct measurement of its recoil effect, on an atom which emitted it, had been sought for several years and was successfully achieved by both Allen and Davis. Allen studied a reaction in which radioactive argon nucleuses became chlorine nucleuses by capture of orbital electrons from the atomic electrons surrounding them. Theory based on energy conservation predicted that a neutrino, carrying away a definite amount of energy, should be emitted during the reaction. Allen constructed an ingenious apparatus for measuring the recoil velocity of chlorine atoms just after their formation from argon atoms; his results definitely indicated that energy was carried off from each nucleus in a single direction, giving the nucleus the theoretically expected recoil energy. Davis also studied an "electron capture" radioactive transition: the one in which radioactive beryllium nucleuses become lithium nucleuses. In his apparatus the beryllium, a solid, was deposited as an ultrathin metallic layer, and the recoil velocities of the lithium ions formed from the beryllium were measured by use of the effects of an electrical field on the ions. He, too, found evidence that the emitted energy went off in a definite direction. Davis' results also confirmed, in agreement with results of other experimenters, that although neutrinos can carry off varying amounts of energy in various processes, their mass at rest must be zero or very small: at most, much less than the mass of an electron.

Cosmic Rays.—Many further observations of V-particles—the new particles whose existence had been definitely established in the previous year—were made in connection with studies of cosmic radiations. The accumulation of data on other aspects of cosmic rays was continued by many workers. J. R. Winckler of the University of Minnesota, Minneapolis, introduced what promised to be a valuable new technique in cosmic ray research. The velocity of light in a vacuum is the maximum attainable velocity in nature; in matter, however, light travels somewhat slower than in a vacuum, and a high-energy particle may travel through a given substance with a velocity greater than the velocity of light in that substance. When a charged particle does move through a substance with a velocity greater than that of light in the substance, it emits a kind of light which is known after its discoverer as Čerenkov radiation. Winckler constructed a detector in which the cosmic ray particles pass through a leucite block, which has a photomultiplier tube attached on one face. Fast-moving particles which enter within a given cone of directions give rise to Čerenkov radiation which is detected by the photo tube. The apparatus thereby gives a convenient way of determining particle directions.

Crystal Growth.—There were interesting developments in a little publicized field of physical research, that of crystal structure and growth. It had been known for several years that the simple growth rate equation for crystals did not always agree with rate measurements. This equation had been derived on straightforward considerations of the concentration of crystal atoms in the liquid surrounding a growing crystal, the chances of a new crystal nucleus being formed and the energy required for the laying down of a flat crystal layer (as was assumed) of unit area on the crystal face. In 1949 F. C. Frank of the University of Bristol, Eng., had suggested and theoretically justified a growth equation based on an assumption of crystal growth in which the crystal thickens not by accretions of successive flat layers but a spiral growth: an edge grows so as to

give a broad base, a relatively small tip and a continuous setback edge that winds up in the form of a spiral. Shortly after Frank proposed his theory, the first evidence for it had come from studies on beryl by J. Griffin of the University of London.

Striking further evidence on the spiral growth formations came from a number of laboratories, chiefly in England. A. J. Forty of Bristol, for one, presented photographs of the spiral formations in cadmium iodide. Paraffin, silicon carbide, gold and mica were among other crystals for which spiral growth was reported. The individual formations were small in size but were very clearly photographed with the use of ordinary optical microscopes or by use of optical interferometric methods. The spiral growth originates in a "screw dislocation" in the crystal, which is a kind of irregularity, in the lattice of atoms in the crystal, that may provide growing edges on the crystal face. These edges serve as nucleuses for crystal growth, and the geometry of the dislocation is such that growth is in the form of the spirals that were observed.

Fundamental Theory.—Two theoretical developments—both of a tentative nature but both addressed to basic problems in contemporary physics—attracted wide attention during the year. One was the new electromagnetic theory proposed by P. A. M. Dirac of Cambridge university. The other was a reinterpretation of quantum mechanics suggested by David Bohm of Princeton university and the University of São Paulo, Braz.

The establishment of definite values for the mass and charge of the elementary particles of nature, as for example the electron, naturally led to the question, why should a given particle have the fixed and definite charge and rest mass value that it does have? Physicists want to make their science as much a deductive system as is possible, so that any given fact or relation of nature is not an isolated fact but is required by other facts or relations. Hence, a satisfactory theory which would state why the electron has its definite charge and mass would be an important achievement. Dirac's new electromagnetic theory represented a step in this direction. He cast the fundamental equations of electromagnetic theory—the theory that is usually expressed in terms of Maxwell's four equations—in a form such that the charge or mass of the electron does not enter alone, but only in the ratio of charge to mass. This ratio may be determined experimentally without explicit knowledge or measurement of the value of mass or charge. It was Dirac's hope that in a further development of the theory the values of charge and mass would appear as necessary consequences. In the stage of development so far reached the theory would not have attracted wide attention were it not that Dirac's new formalism indicated that the ether is necessary for electromagnetic phenomena. The ether as a substratum for light waves and all other electromagnetic phenomena had presumably been disposed of several decades before by the Michelson-Morley experiment and the special theory of relativity; but in Dirac's new theory the ether reappeared with properties such that it could not be dismissed on the grounds of the previous arguments against it. Dirac's proposal was of course no more than a cogent suggestion, and he himself wrote: "The existence of an ether has not been proved, of course, because my new electrodynamics has not yet justified itself."

Bohm's work was an attempt toward finding "hidden variables," as he termed them, which would remove the indeterminate, statistical nature of physics on the atomic and subatomic level. It has been a consequence of modern quantum physics that the behaviour of a particle or light wave cannot be completely and precisely described or predicted. This limitation, although generally accepted, had been philosophically unsatisfying to many physicists. Bohm suggested an ingenious reinterpretation of the fundamental equations of quantum theory which

allows us to consider physical events, even on the smallest scale, to be completely determined. Refinements beyond current physics would be required before complete, detailed descriptions could be given of such events; but on the usual quantum theory point of view, such refinements are not even in principle possible. Bohm's reinterpretation assumes that elementary particles are point particles in space, as in classical physics, rather than entities with both point and wave properties. To some physicists the suggestions of Bohm seemed to be a regression, but the interest shown in his work indicated the widespread concern over the quantum theory. In spite of its great success in giving a theory of atomic structure, quantum theory, as Bohm and many others pointed out, was not properly correlating or explaining physical phenomena where distances less than about 10^{-13} cm. are involved. The opinion that some kind of fundamental extension or change in quantum theory is necessary was commonly expressed. (See also ELECTRONICS; STANDARDS, NATIONAL BUREAU OF.) (RI. SL.)

Physiology. In an emergency the manual method of artificial respiration may be a lifesaving measure. It has the advantage that it can be instituted promptly, and no additional material or equipment is needed. In 1948 a comparative study of the common methods (Schäfer, Sylvester, Nielsen) was begun. The results were reported in 1951-52 and constitute the most significant assay of manual artificial respiration ever carried out.

Information was obtained in each of the methods studied concerning the volume of air moved, the aeration of the blood, the air flow patterns, the energy expended by the operator and the fatigue he experienced, and the "teachability" of the method.

The method recommended as a result of this study was a modification of the Danish Nielsen method, which will be referred to as the arm-lift back-pressure method (ALBP). In the conventional Schäfer method air is expelled by pressure on the back of the prone subject. Air is taken in by the recoil of the chest when the pressure is removed. There is evidence that, when performed at the standard rate of 12 times per minute, the chest does not expand to the resting level.

In the various push-pull methods including ALBP there is the additional advantage of enlarging the chest above the resting level during the inspiratory (pull) phase. Studies on normal adults, rendered unable to breathe spontaneously by anaesthesia and curare, show that the push-pull methods of artificial respiration yielded two to three times the ventilation obtained by the Schäfer method.

The studies on oxygenation of the blood also demonstrated the superiority of the push-pull methods over the Schäfer method. The former were adequate to sustain the normal anaesthetized, curarized subject throughout the 15-minute experimental period, whereas the Schäfer method had to be discontinued in three out of nine cases because of alarming cyanosis and low blood oxygen levels.

The Schäfer method was least taxing on the operator. The hip-lift back-pressure method required the greatest energy expenditure, while the recommended ALBP was intermediate. The Sylvester method gave good ventilation and required only a moderate expenditure of energy, but showed the serious disadvantage that with the subject lying on his back, the tongue tends to drop back into the pharynx, occluding the air passages.

The Arm-Lift Back-Pressure Method.—The subject is placed in the prone position with the hands on top of each other, the forehead resting on the hands with the face turned slightly to one side. The subject's elbows extend laterally. The operator kneels on one or both knees in front of the subject's head. He places his hands under the subject's arms above the elbow and

rocks backward, drawing the arms upward and toward himself. They are elevated until firm resistance is met, then replaced on the floor. The operator then moves his hands to the area just below the scapula (shoulder blade) and rocks forward, exerting pressure on the back. The position of the operator's hands is such that the thumbs lie close to the spine and the fingers are separated extending posteriorly and laterally. The complete cycle is repeated about 10 to 12 times a minute.

Observations on an Isolated Loop of Human Jejunum.—The opportunity to make observations on an isolated loop of human intestine rarely occurs. W. P. U. Jackson recorded his observations on a patient who had a loop of intestine slung deep to the anterior abdominal wall with both ends opening out through the skin. The isolated loop retained its blood supply. The continuity of the severed intestinal tract was restored. The purpose was to construct an artificial oesophagus with the loop, at a later operation, replacing an oesophagus completely closed by stricture. The patient was fed through an opening in the stomach.

Peristalsis was easily observed at the exposed ends and caused rippling of the abdominal wall with a maximum frequency of ten waves per minute. The wave might start or end at different points on the loop. Peristalsis was evoked by stroking the exposed ends or by the injection of fluid. The waves became violent when 10 to 15 ml. of fluid were injected into the upper end. Movements suggesting rhythmic segmentation were observed. In this case there was repetitive contraction and relaxation without onward propulsion of the contents. Pain felt in the umbilical region was produced by tightly tying the lower protruding end with tape.

Unlike the mucosa of the stomach, the colour of the jejunum was not affected by the patient's mood. Adrenaline and noradrenaline applied locally constricted the mucosal vessels, causing blanching for many minutes.

The secretions were collected and found to contain a trypsin-like ferment, a lipase, multase, amylase and invertase. The order of the rate of absorption of monosaccharides seems to be that found in animals, galactose > glucose >> fructose > pentoses.

Atmospheric Oxygen and the Human Cornea.—The use of contact lenses over the eyes may result in an increasing haziness of vision and the appearance of halos on looking at bright sources of light. These effects disappear on removal of the lenses.

The transparent cornea does not have blood vessels like other parts of the body. It might obtain oxygen from the atmosphere and lose water to it. George K. Smelser and V. Ozanics studied the effect of modifying the atmosphere in contact with the human cornea by fitting four subjects with diving goggles equipped with tubes through which the desired gas could be passed continuously. At intervals the subject would direct his gaze toward a bright light source to test for the appearance of halos. No halos were produced by exposing the cornea to moist air or moist air-carbon dioxide mixtures. Bright halos developed in two to three hours when dry nitrogen was used, and vision was hazy for a short time after the goggles were removed. This shows the effect of a lack of oxygen. Still brighter halos resulted when water-saturated nitrogen was used. In this case evaporation of water from the cornea was prevented and a tendency toward hydration presumably occurred.

Contact lenses with stoppered openings were fitted to the four subjects and caused definite halos in $1\frac{1}{2}$ hours. The addition of nitrogen bubbles to the contact lens fluid did not affect the halo development, but the introduction of oxygen bubbles under the lens prevented the appearance of the halos in experiments lasting seven hours. These results indicated that contact

lenses interfere with the oxygen supply to the cornea.

Sludged Blood.—Normally the circulating red blood cells are not agglutinated but tend to repel each other slightly. In a variety of clinical conditions in man and animals many blood cells may become agglutinated into masses, a condition referred to as sludged blood.

Edward H. Bloch and Allen Powell demonstrated for the first time by means of the electron microscope a coating on human red cells from sludged blood. The magnifications used ranged from 3,500 to 20,000 times, much higher than could be obtained from a microscope using light. The coating covered the entire cell surface, was irregular in outline, varied in thickness and was relatively amorphous, even with the higher magnification. The diameter of the sludged red cells was increased. Bridges connecting the individual cells were seen and photographed. The red blood cells from persons with healthy circulations have surfaces with a sharp outline. Previously it was possible to demonstrate, by dark-field microscopy of red blood cells taken from a rhesus monkey with malaria, that the cells were held together by a highly refractile substance. By microdissection this coating could be drawn into long, highly refractile, viscous elements. The origin of the coating on the red cells was unknown. It could be derived from the red cells or from the plasma.

In an earlier article M. H. Knisely *et al.* described a method for observing the clumping of red blood cells while circulating in the blood vessels of man and animals. The clumps formed may be large or small. They may break up or may combine to form larger clumps. A blood vessel may be blocked permanently or, more often, only temporarily.

The blood flow through the conjunctival vessels of hundreds of living unanaesthetized human beings had been observed, using a microscope and reflected light. H. Zilliacus and T. Arajärvi, employing this method, found evidence of sludged blood in 12 Rh-immunized newborn infants, whereas it was absent in healthy children.

Severe trauma occurring at birth or infections developing in infancy may also be accompanied by clumping of red blood cells.

Pinay, Antoine (1891-), French industrialist and statesman, was born at Saint-Symphorien-sur-Coise, Rhône, Fr., Dec. 30. He was educated at the Marist Fathers' secondary school at Saint-Chamond, Loire, and entered a tannery business in the same town. He was wounded in World War I and won the *médaille militaire* and the *croix de guerre*. His first elective office was that of mayor of Saint-Chamond (1932). In 1936 he was elected to the chamber of deputies as an Independent Radical (that is, a moderate conservative) and in 1938 as senator for the Loire *département*. He was one of the 569 parliamentarians who on July 10, 1940, voted at Vichy full executive and legislative powers to Henri Pétain as head of the *état français*. In 1941 he was appointed to the short-lived *conseil national* set up by Pétain, but subsequently took a courageous stand against the Germans, as a result of which he was freed in 1945 from the "ineligibility" restriction imposed on deputies and senators who had supported the Vichy regime. In Nov. 1946 he was elected to the national assembly as an Independent Republican (*i.e.*, conservative) and re-elected in June 1951 with the same label. He was undersecretary of state for economic affairs in the first Queuille cabinet (Sept. 1948-Oct. 1949) and became minister of transport in the first Plevin cabinet (July 1950), a post he held until his election to the premiership on March 6, 1952. He resigned on Dec. 22.

Pittsburgh. The most notable event in 1952 in Pittsburgh's improvement program was the opening of the \$32,000,000 greater Pittsburgh airport, covering 1,600 ac., and with a principal runway 8,000 ft. in length. Five new multi-story office buildings were occupied or neared completion, to add 1,800,000 sq.ft. of space in the Golden Triangle. The Pittsburgh Parking authority completed two garages to accommodate 1,594 motor cars and a city block was demolished to build an underground garage housing 900 more.

The Allegheny Conference on Community Development turned to the stimulation of cultural activities. The year marked Pittsburgh's first International Contemporary Music festival. William Steinberg became conductor of the Pittsburgh Symphony orchestra. The Pittsburgh Playhouse doubled its plant for theatre and school. An extensive program of playground improvements neared completion and a new aviary was opened.

The University of Pittsburgh completed a modern field house and further enlarged its medical centre. Duquesne university dedicated the first building in a \$12,000,000 program. The Pennsylvania College for Women broke ground for three new buildings. The Carnegie Institute of Technology opened a \$6,000,000 graduate school of industrial administration provided by the gift of W. L. Mellon.

Studies of the north side and lower hill areas, the latter a possible location for a new civic and recreational centre, were advanced. Long-term engineering studies of water supply, stream purification and sewage disposal progressed.

A prolonged steel strike depressed production, trade and transportation. In the first nine months of 1952 business activity stood at 169.6% of the 1935-39 average, 12.7% less than for the corresponding period of 1951, according to the Bureau of Business Research of the University of Pittsburgh. The rate of steel operations for 40 weeks was 77% of capacity, 21.9% less than in the last corresponding period. Bituminous coal production went down 17.4% for the first three quarters. Department store sales for the first 40 weeks, however, were only 5.4%

less than in the corresponding period of 1951.

Taxable real estate in Pittsburgh was \$102,813,256; in Allegheny county, \$2,330,000. Pittsburgh's population, 1950 census, was 676,806, the 12th city in the nation, and that of Allegheny county, 1,515,237. The Pittsburgh metropolitan district numbered 2,213,236. David L. Lawrence was mayor of Pittsburgh in 1952. (C. F. Ls.)

Pius XII (1876-), the 262nd successor of St. Peter in the see of Rome, was elected by the cardinals in conclave on his 63rd birthday, March 2, 1939, and was crowned as pope on March 12. (See *Encyclopædia Britannica*.)

Pope Pius sanctioned European unity during 1952 in addressing a European pilgrimage. "... if today political personalities are conscious of their responsibility, if statesmen work for the unification of Europe, for its peace and for the peace of the world, the Church in truth cannot remain indifferent to their efforts, but sustains them with all the strength of its sacrifices, and of its prayers," his holiness said. He also urged the people of Germany to feel and remain united across the political barriers that divided their country and reminded them that "as long as any believers exist, even if in chains, materialism cannot speak of victory."

The pope, in an apostolic constitution, ordered the Consistorial Congregation to create a Supreme Council of Emigration and an International Secretariat General of the Apostolate of the Sea. He founded at the same time the new office of Delegate for Emigration to promote and co-ordinate pastoral activities on behalf of emigrants of all categories and nationalities.

An apostolic letter beamed to the people of the Soviet Union dedicated them to the Virgin Mary and called upon the Soviet people to resist, if necessary unto death, the atheistic and materialistic features of communism.

Broadcasting over the Vatican radio on the occasion of Family day, his holiness declared it the right and duty of the church to teach and interpret divine law not only as it affects the behaviour of individuals but also in its bearing upon public, economic and social life and upon the actions of all lawful authorities, both at home and abroad, in peace and in war.

The pope laid down a moral code for doctors and medical researchers which, he said, would act as a brake to confine research so that it would not cause damage more serious than the ills it hopes to cure. Three factors, the pontiff declared, must be taken into account "to morally justify new proceedings, new attempts and new methods of medical research and treatment." These are, he said, the interest of medical science; the individual interest of the patient to be treated; and the interest of the community.

In a letter to Charles Flory, president of the Semaine Sociale, a French Catholic organization, Pope Pius said the distribution of the fruits of labour is too weighty a matter to be left to the free play of blind economic forces and required the intervention by the state as a co-ordinator. The system he favoured would be equidistant from the errors of liberalism and statism and would leave all legitimate freedom to private enterprise without replacing it with the oppressive omnipotence of the public authorities. Plastics Industry. Final figures for the 1951 production of plastics and synthetic resins in the U.S., compared with 1950, are given in the table on page 566.

PLASTIC SKELETONS cast from originals and being mass-produced by a firm in Texas in 1952 to relieve the scarcity of real skeletons needed by U.S. medical schools and in private research. All the separate bones making up the plastic skeletons were interchangeable so that parts that became chipped or broken could be replaced after breakage

Production of Plastics and Synthetic Resins in the U.S.*

(In pounds)	1951	1950
Cellulose plastics (all)†	121,817,300	127,500,000
Phenolic and other tar acid resins‡	481,603,000	372,200,000
Urea and melamine§	229,102,000	185,100,000
Styrene and styrene-derivative polymer and copolymer resins	375,040,000	332,000,000
Vinyl resins	464,512,000	402,000,000
Miscellaneous¶	362,312,000	263,000,000
Total	2,034,386,300	1,681,800,000

*Source: U.S. Tariff Commission.

†Includes fillers, plasticizers and extenders.

‡Includes sheets, rods, tubes, moulding and extrusion materials, primarily ethyl cellulose and Valite.

§All dry resin except moulding material which includes filler.

||Excludes data on protective coatings.

¶Tariff Commission figures included filler for film and sheet every year except 1951. For comparative purposes in this table an estimated figure for filler was added to the 1951 figure for film and sheet in order to show trends.

¶Includes acrylic, polyethylene, nylon and other resinous moulding materials; petroleum resins and coumarone indene.

While government allocations and materials scarcities plagued the industry in the beginning of 1952, especially in polyethylene, styrene and resorcinol, that situation was greatly relieved by the middle of the year. Scarcities vanished, allocations were removed and business started back to more normal operation. Production facilities in practically all branches of the industry were being enlarged and approximately 15% of all production was going to defense purposes.

Civilian production of established plastics products such as housewares, wall tile, flooring, work-surface covering, rain-wear, upholstery, luggage, etc., continued during 1952 at a rate in keeping with the expanding manufacture of raw materials. Heavy industry use of plastics—electrical, automotive, building, etc.—showed normal expansion. Increased interest was manifest in those materials which offer special properties—fluorocarbons, silicones, styrene copolymers, epoxies, and blends of rubber with styrene and phenolics. In addition there was a big upsurge of applications for plastics sheet formed into end products by the use of heat and pressure and a continuing growth of reinforced plastics—combinations of fibrous glass and plastic resins.

Fluorocarbons.—The fluorocarbons—polytetrafluoroethylene and polychlorotrifluoroethylene—have excellent resistance to moisture, good electrical characteristics, chemical inertness and high heat resistance. They had come into wide use where their properties outweighed their cost: in chemical handling equipment, refrigeration systems, valve seats, specialized electrical applications, and in thin films where zero water vapour transmission and zero moisture absorption were desired.

Silicones.—Chemically related to such inorganic materials as quartz, silicones were produced in 1951 in the amount of an estimated 10,000,000 lb. This quantity was used in such varied forms as laminating and moulding resins, coatings and varnishes, fluids and elastomers or silicone rubbers.

Like the fluorocarbons, the silicones have outstanding electrical, thermal and chemical properties. During 1952 the applications which received the most attention included such diversified uses as the coating of bakery pans, improved insulation for electrical transformers, wire coating, gaskets, laminates for aircraft parts, moulded electrical equipment, waterproofing of concrete, interior coating of bottles for antibiotics, waterproofing of glass cloth, and torsional vibration dampers for automobile engines.

Resistance to both heat and cold is an outstanding property of silicones, and one that was being constantly improved. For example, in 1950 the lowest temperature at which silicone rubber would remain flexible was -70°F. ; by 1952 that working temperature had been reduced to -110°F.

It was estimated that between 60% and 80% of all silicone production in 1952 went directly or indirectly to military

items. One major producer of these materials announced early in 1952 that \$13,000,000 would be invested in plant expansion for the manufacture of silicones.

Styrene Copolymers.—Styrene copolymer sheet stock came in for wide attention during 1952 because of the announcement of new materials and the development of improved forming techniques. Advantages of these plastics sheets include high strength, ease of formability, high abrasion resistance, chemical inertness and low water absorption. The sheets can be formed by heat and pressure; they can be machined by standard shearing, sawing, punching and drilling procedures; they can be cemented; and they can be printed or hot stamped.

Because the styrene copolymer sheets are tough and have high tensile strength, they can be drawn to extreme depths, if care is exercised in applying the heat needed to soften the material before forming. Thus, a pattern-heating method announced during 1952, coupled with improved mould design, made possible the production of formed parts with thick wall sections at corners and edges where the thinnest sections would otherwise be expected.

Many of the applications of styrene copolymer sheets during 1952 were for military use; others included boat decks, automobile dash panels, refrigerator door liners, radio cabinets, traffic markers, industrial tote boxes, wash basins for aeroplanes and trailers where light weight is a requirement, television tube masks and business machine housings.

Copolymer sheets offered during 1952 had a wide range of colours, surface finishes ranging from mirror smooth through matte to leather patterned, and thicknesses from 0.015 in. to 0.5 in.

Epoxies.—Interest in epoxy resins during 1952 centred on their uses in adhesives, potting compounds, surface coatings, and as vinyl stabilizers. Epoxies, based on ethylene oxide or its homologs or derivatives, show very little shrinkage during cure; have excellent adhesion to metals, glass and ceramics; and, when cured, exhibit chemical resistance and good mechanical and electrical properties. As vinyl resin stabilizers, epoxies are nontoxic.

Because of their unusual adhesive qualities, epoxies were widely studied as cements for metals. They can be cured at room temperature and without the use of pressure. Hence they were used in fabricating metal structures which formerly required the use of heat in soldering, welding or brazing operations. Because the epoxies do not require high heat to develop their maximum strength (a practical cure temperature for fast setting is less than 200°F.), they can be used under conditions where the heat of brazing or welding would tend to warp the metal structure. Heat exchangers, for example, where thin metal fins must be fastened permanently to tubes, were satisfactorily fabricated with epoxy adhesives as the sole bonding agent. Not only does the low cure temperature of the epoxies avoid metal distortion, but it also prevents degradation of the metal which often accompanies the use of the welding torch or arc.

Plastics Plus Rubber.—Three new formulations of styrene modified with rubber were announced during 1952. They can be injection moulded to produce parts with thin but strong cross-sections and can also be extruded in the form of thin, tough sheets. All three grades have high impact resistance, ease of mouldability and extrusion, machinability, and combine excellent electrical properties with the chemical resistance of styrene. Sheets extruded of these new materials are easy to post-form, swedge or blow to large shapes such as refrigerator trays. They can be produced in a variety of colours, can have finishes ranging from matte to a high polish, and can be printed readily.

These materials were used to produce refrigerator door liners and frames, battery cases, pipes, chair seats of extruded strips, and a variety of injection-moulded toys.

Rubber was also being blended with phenolic resin to produce materials with the strength, hardness and fast cure of the resin plus the toughness inherent in an elastomeric polymer. By 1952 these blends had advanced to a point where they were being used in moulding such diversified parts as dishwasher impellers, industrial gears, components for air circulators, bobbins for textile machinery, tool racks and parts for shoe-making equipment. The anticipated use of rubber-phenolics production for 1952 was as follows: 65% for industrial purposes, 25% for military purposes and 10% for consumer applications.

Reinforced Plastics.—Consisting essentially of fibrous glass and plastics resins (usually polyester), reinforced plastics in 1952 continued their growth. One of the outstanding applications announced during the year was in the walls of an alert shelter for jet planes, designed for military use. This shelter, 72 ft. wide, 64 ft. long and 24 ft. high, could be erected in two days by a four-man crew. The framework was a set of magnesium arches; the panels which formed the skin of the shelter were of fibrous glass-polyester plastic, 4 x 8 ft., strengthened with moulded-in ribs. Added insulation was provided by fibrous glass wool in bat form, held in place in each panel by a sheet of vinyl-coated fabric.

Boats of reinforced plastics had become standard for many military and civilian uses. By 1952 it was announced that the U.S. department of defense had acquired a number of reinforced plastic boats made by different methods. These boats included small and large landing craft, 28-ft. cruisers, 12-ft. wherries and 26-ft. whale boats.

Production Methods.—Two new methods of casting vinyl plastisols were announced. One was developed to ensure uniform wall thicknesses, the other to obtain controlled variable wall thicknesses. In the first method closed moulds are used. After charging with a measured amount of material, the moulds, locked in closed position, are automatically rotated in several planes so that the plastisol is uniformly distributed over the interiors. The rotation is continued during the cycle of curing and cooling.

In the second method open moulds are used. These are charged by the conventional method of filling and dumping, which leaves a layer of the liquid plastic adhering to the mould surface. As the moulds proceed through the fusing oven they are tilted through predetermined angles to cause flow of the liquid to points where thicker sections are wanted.

A machine for the production of 14-gal. polyethylene carboys was announced during 1952. In this unit (a combination of an extruder, an injection machine and a blow moulding setup) the extruder plasticizes the plastic and feeds it to an injection cylinder. From there, the softened material is forced in the form of a tube into a blow-moulding chamber where compressed air expands the tube to conform with the shape of the mould.

A continuous process for the production of reinforced plastic pipe was put into operation during 1952. The pipe, in 20-ft. lengths, is formed around a vertical mandrel which travels upward through the centres of several work tables. At each table, layers of glass tape or rovings and polyester resin are applied. After an oven cure the mandrel is withdrawn and returned to the production line.

The trend toward preplasticizers for injection machines continued. Thus, a machine with four preplasticizers was announced in 1952. With all four units in use the machine had a capacity of 375 oz. of styrene; with two units the capacity was 165 oz. The hopper would hold 850 lb. of material. (See also MUNI-

TIONS OF WAR; RAYON AND OTHER SYNTHETIC FIBRES.)

Poland. A people's republic of eastern Europe, Poland is bounded east by the U.S.S.R., south by Czechoslovakia, west by Germany and north by the Baltic sea. Area: 120,359 sq.mi. Pop.: (1950 census) 24,976,926; (1952 est.) 25,500,000. Language: Polish. Religion: Roman Catholic. Chief towns (pop., 1950 census): Warsaw (cap., 650,064); Lodz (619,914); Cracow (330,046); Poznan (320,294); Wroclaw (289,734); Gdansk (193,530); Szczecin (178,210); Katowice (141,277). President of the republic, Boleslaw Bierut; chairman of the council of ministers, Jozef Cyrankiewicz. From Nov. 20, 1952: chairman of the council of state, Aleksander Zawadzki; chairman of the council of ministers, Boleslaw Bierut.

History.—Promulgation of a new constitution and new elections were the main events of 1952. The new constitution was passed unanimously by the *sejm* on July 22, the national day of the Polish people's republic, anniversary of the so-called Lublin manifesto and of the emergence into the open of the Moscow-sponsored Polish Committee of National Liberation. The main features of the constitution were familiar, since as Stefan Jedrychowski, a deputy premier, claimed in the debate, it was "modelled on and inspired by the great Stalin constitution of 1936."

The supreme organ of state authority was the council of state (in the U.S.S.R. the presidium of the supreme soviet), composed of a chairman, four deputy chairmen, a secretary and nine members. The supreme organ of state administration was the council of ministers appointed by and responsible to the *sejm*, or to the council of state if the *sejm* was not in session. One original departure in the Polish version of the constitution was that it recognized and protected, "on the basis of existing legislation, individual property and the right to inherit land, buildings and other means of production belonging to peasants, craftsmen and persons engaged in domestic handicrafts" (article 12).

Under article 70 the Polish people were also guaranteed freedom of conscience and religion.

The Church and other confessional communities [stipulated article 70] can freely fulfil their religious functions. It is not permitted that the citizens should be prevented from participating in religious activities or ceremonies. It is also not permitted that anyone should be compelled to participate in religious activities and ceremonies. The Church is separated from the state. The basis of the relations between the Church and state, as well as the legal position of the confessional communities, and their property, will be defined by law. Misuse of the freedom of conscience and confession for purposes contrary to the interests of the Polish republic will be punished.

It is not difficult to see how these principles might lend themselves to elastic interpretations. As in the U.S.S.R., parents and priests could be punished if they "compelled" children to learn their religion or to go to church. The laws concerning the church could be amended by the Communist *sejm* and the Holy See could be ignored. The property of the church, already partly confiscated, could be nationalized or heavily taxed; there would be small possibility of maintaining Roman Catholic schools or Catholic charitable institutions, for there was no specific guarantee for such rights.

The electoral law adopted by the *sejm* on Aug. 1 accorded

the franchise to all citizens of 18 years, including members of the armed forces; citizens of 21 years were eligible for election. There was one deputy for every 60,000 inhabitants; in every constituency there could be only one list of candidates equal in number to the deputies fixed for the constituency. As there was no choice, the electors, theoretically, might manifest their displeasure by mass abstentions or by striking out the names of all candidates on the list so that none would obtain the required absolute majority of valid votes. In both eventualities the electoral law provided for a re-election. Possibly because the disclosure of any such boycott of the elections or of a mass rejection of the candidates would be embarrassing, the electoral law laid down that the election results were to be published for the whole country by the National Election commission.

On Aug. 25 the council of state promulgated a decree dividing the country into 67 constituencies, the largest being that of Warsaw (15 deputies) and the smallest those of Szczecinek, Stargard Szczeciński and Gorzów (4 deputies each). The list for Warsaw was headed by Bierut, Marshal Konstanty Rokossowski, commander in chief of the Polish armed forces, and Jakob Berman, undersecretary of state at the presidium of the council of ministers. Cyrankiewicz was head of the list in Cracow and Hilary Minc, deputy premier and chairman of the State Planning commission, of whom little had been heard during the year, was at the top of the list in Katowice.

The candidates were formally nominated by the three existing political parties, the Polish United Workers' (Communist) party, the United Peasant party and the Democratic party, and also by the trade unions, the Union of Polish Youth and other "mass social organizations of the working people"; i.e., Communist party under other names. Out of 425 candidates there were only 60 Peasants, 20 Democrats and a few independent "Catholic leaders"; the remainder were Communists, including 19 former Socialists. The elections were held on Oct. 26.

During 1952 there were four age groups in the armed forces giving a total of more than 650,000 effectives. Four new divisions were in formation in addition to the existing 20 which included 3 mechanized and 3 armoured. The officially admitted military expenditure rose between 1949 and 1952 from 1,800,000,000 zlotys to 6,600,000,000 zlotys. Defense expenditure took officially 6.8% of the budget in 1950 and 10.5% in 1952. In fact it was much more, for a great amount of military expenditure was concealed under different headings. It was estimated that real defense expenditure amounted to 10% of the total national income.

Speaking in the *sejm* on July 18, Bierut said that while there were only 2,730,000 wage earners outside agriculture in 1938, in 1947 this number had increased to 3,180,000 and by mid-1952 amounted to 5,340,000. Between 1938 and 1952 the proportion of wage earners outside agriculture rose from 8% to 21% of the total population. The economic plan for 1952 laid down that the production of coal should increase to 86,000,000 metric tons, of crude steel to 3,300,000 tons, of electricity to 12,675,000,000 kw.hr. The greatest expansion was planned in the engineering industry, which was to show a 50% increase, with emphasis on mining machinery, shipbuilding, motor vehicles, rolling stock, heavy machine tools and agricultural machinery. Of next importance was the chemical industry: a considerable effort was to be made to remedy the shortage of sulphuric acid and to expand the production of artificial fertilizers and artificial fibres. By the end of 1952 the share of industry in the national income was to be 53%. Expenditure on investments was to reach 28,000,000,000 zlotys, i.e., about 25% of the estimated national income.

Although the national income was rising steeply, no improve-

ment was noticeable in the standard of living. A letter from Lodz textile workers, smuggled abroad and published by the French Socialist daily *Le Populaire* (Aug. 6), provided a direct confirmation of this.

We have come to a point [said the letter] when we have to pay our day's earnings for 1 kg. of sugar and at least a month's wages for a pair of shoes. A new suit of cloth has become a dream, because to buy this, we must work 4 to 6 months. We live like miserable wretches, driven by the Communist party to produce ever greater norms for ever lower pay and worse treatment. . . . Our trade unions do not protect us, they are against us, the workers. . . . Strikes are forbidden and are considered sabotage. People advocating strikes are subject to penalties reserved for criminals. . . . We are surrounded by spies who lie in wait for any rash word uttered in a fit of bitterness or misery. For one such word you go to the forced labour camps.

By mid-1952 the compulsory registration begun in Dec. 1951 of every inhabitant over the age of 18 was completed.

Education.—Schools (1951-52): kindergarten 7,700, pupils 350,000; elementary 22,980, pupils 3,300,000, teachers 77,000; lower-grade secondary 335, pupils 185,000; higher-grade secondary 486, pupils 140,000; technical 3,000; teachers' training colleges 149, students 33,000. Institutions of higher education 83 (including 8 universities), students 142,000.

Finance.—Budget: (1951 est.) revenue 55,972,000,000 zlotys, expenditure 51,891,000,000 zlotys; (1952 est.) revenue 63,787,000,000 zlotys, expenditure 62,876,000,000 zlotys. Monetary unit: zloty with official exchange rates of 1 zloty to the rouble, 11.20 zlotys to the pound sterling and 4 zlotys to the U.S. dollar.

Foreign Trade.—(1950) Imports U.S. \$844,000,000; exports U.S. \$631,000,000. Main sources of imports (1950): U.S.S.R. 40.1%; Czechoslovakia, Hungary, Rumania and Bulgaria 18.3%; Sweden 3.8%; U.K. 2%. Main destinations of exports: the four eastern European countries 24.6%; U.S.S.R. 23.2%; U.K. 7.8%; Sweden 5.7%.

Transport and Communications.—Railways (Jan. 1949): 21,415 km.; passenger traffic (1950) 26,352,000,000 passenger kilometres; freight traffic (1950) 34,944,000,000 ton-kilometres; goods carried (1950) 148,128,000 tons. Roads (1947): 96,605 km. Licensed motor vehicles (1948): cars 24,240; commercial vehicles 28,957. Shipping (1949): merchant vessels 46, total tonnage 164,989 gross registered tons. Freight traffic in Polish ports (external trade, 1950): loaded, 12,456,000 metric tons, unloaded 3,216,000 metric tons. Ships entered (1950): 7,248,000 net registered tons. Air transport (1950): 30,468,000 passenger-kilometres flown; 619.2 ton-kilometres of cargo transported. Telephones (1950): 225,000. Radio receiving set licences (April 1952): 1,848,000 including 800,000 served by relay stations.

Agriculture.—Main crops (metric tons, 1950): wheat 1,854,000; barley 1,077,000; rye 6,503,000; oats 2,126,000; potatoes 36,835,000; sugar beets 6,377,000. Livestock (Dec. 1950): cattle 7,164,000; pigs, 9,408,000; sheep 2,194,000; horses 2,797,000. Meat production (1950): 1,252,800 tons, including 859,200 tons of pork.

Industry.—Fuel and power (metric tons, 1951): coal 81,700,000; lignite 5,000,000; crude oil 184,000; synthetic fuels 146,000; electricity 11,101,000,000 kw.hr. Raw materials (metric tons, 1951): steel ingots and castings 2,712,000; zinc 120,000; lead 18,500. Manufactured goods (metric tons, 1951, except as indicated): cotton yarn (1950) 92,200; cotton fabrics 73,800; wool yarn (1950) 41,900; rayon filament yarn 11,200; cement 2,683,600. Building bricks (1950) 1,464,000,000.

Police. Law enforcement issues in Great Britain during 1952 chiefly centred around the continuing difficulties experienced in attracting suitable manpower to the police service. Some part of this problem was met by the new pay scales announced in 1951; but in London the commissioner of police of the metropolis moved also to employ police cadets on clerical, mechanical and other tasks not requiring enforcement powers. One month's training was provided for them and it was hoped that they would eventually constitute a new and increasingly valued source for police recruitment.

While these interesting events were transpiring in London, the first large-scale survey of New York's police defense was reaching similar conclusions in July 1951 concerning the advisability of securing some part of police recruits from ages well below full and legal majority. Hence it appeared that the world's two largest cities might soon be independently engaged in drawing some part of their police manpower from young men who planned to spend their entire productive years in the police service.

The New York police survey pointed to scores of defects in the city's police defenses, and stated that some of them had already been corrected while correction of others had been approved by the police commissioner. About one-sixth of the police

STATE POLICEMAN broadcasting a call (left) over a three-way radio system used for speed control in Connecticut in 1952, enabling police cars equipped with radar to record the speed of approaching cars and radio their findings to troopers farther along the road

manpower was declared to be assigned to tasks that should not be performed at all, or to be discharging duties for which non-police employees and youthful cadets would prove better fitted.

Despite the difficulties encountered in New York in securing witnesses against police charged with complicity in gambling, the administrative trials continued on a large scale and with few exceptions they resulted in dismissals. Frequent judicial appeals from rulings by the police trial commissioner were decided against the defendant police. Harry Gross, so-called book-making czar of Brooklyn, appeared repeatedly against police who were charged by him with receiving his protection payments. In most instances other witnesses helped to substantiate these charges, and the police on trial were thereupon dismissed from the service. Identified by Gross as recipients of his graft, but not brought to administrative trial because no longer members of the force, were a former police commissioner, a former chief inspector and scores of other police ranging from inspector to patrolman. Most of these had taken their retirements to avoid trial, which had produced insistent popular demand that such "midnight resignations" on pension should not be tolerated. The New York state legislature acted to deny pension rights in future cases, and this statute was upheld on appeal.

A similar inquiry by a congressional committee into the nationally controlled police department of Washington, D.C., produced evidence of conditions that differed only in scale from those shown to prevail in New York.

For the United States, at least, it was a difficult year not only for many unworthy policemen, but also for many more whose records were unblemished but whose professional pride and self-esteem suffered from the misdeeds of their faithless colleagues.

Re-emergence of Japan as an independent sovereign nation found it operating its police forces according to western patterns that were imposed by the postwar military occupation. Whether such foreign institutions could be successfully transplanted raised questions of interest to police administrators everywhere.

The 21st general assembly of the International Criminal Police commission was held in Stockholm, Swed., June 9-12, 1952.

Delegations representing 49 countries and 7 societies and associations were in attendance. International crime problems under consideration included the narcotic drug traffic, counterfeiting, identification of mailbags in international transit, repatriation of minors, air police and allocation of radio frequencies and criminal statistics.

The International Association of Chiefs of Police met in Los Angeles, Calif., in Sept. 1952 with 2,000 delegates and invited guests in attendance. The sessions were enlivened particularly by the vigorous objections taken by local police chiefs of the United States to the conclusions formed by a law enforcement committee of the American Bar association. These were to the effect that local police agencies in each of the 48 states should be subjected to standards, controls and inspections imposed by the various state governments. Even the prospect of state subventions as a reward for those who conformed did not influence the unfavourable attitudes of the city, town and county police representatives.

Also attracting much attention were the discussions of police unions and their possible influence on the future of police discipline and law enforcement. (See also CRIME; FEDERAL BUREAU OF INVESTIGATION; SECRET SERVICE, U.S.)

Poliomyelitis: see INFANTILE PARALYSIS.

Political Parties, British. The Conservative party started the year 1952 with a majority of 26 over its Labour opponents in the house of commons and of 17 over all other parties. The main outlines of its propaganda, if not of its policy, had already been clearly defined. It was to be the government which put "first things first," sweeping away cobwebs from the vast administrative machine which it inherited and cutting through red tape to the essentials of economic recovery. The government, it was claimed, had succeeded to an economic crisis far graver than could have been inferred from the relatively optimistic pronouncements of its predecessors. It could make no promises save of greater austerity, and it would bring to its task a national view of the nation's needs and a wholesome contempt for purely party government.

It was obviously only a matter of time before the political struggle resumed its pre-election violence, and by the spring even the pretense of an informal truce had been abandoned. "Gradualism," however, was the keynote of the government's economic policy. By still further reducing imports and imposing small additional charges for the health service, it took action for which the policy of its predecessors provided excellent precedence, although the latter measure was vigorously opposed by them. By raising the bank rate twice it seriously limited private borrowing and created a considerable slump in government securities. Thus the stage was set for R. A. Butler's first budget, which provided a judicious instalment of what had come to be known as "disinflation." For the first time in many years the emphasis of the chancellor's speech was on the positive need for more production rather than on the negative need for more self-restraint.

The spirit at the Conservative party conference at Scarborough in October was one of strictly qualified complacency. On the one hand, R. A. Butler was congratulated for having temporarily restored Great Britain's balance of overseas payments, mainly by stringent, official restrictions on imports. It was

realized, however, that the prospect of maintaining this balance in the face of ever-increasing competition from abroad depended on administering a decisive check to inflation at home, and this had not been done. Wages had continued to rise, and the dilemma of how to maintain the social services at their existing level without either stimulating inflation or reducing rearmament had to a large extent been sidetracked. The feeling was widespread that in its first year of office the government had pointed the way but had not followed with sufficient vigour.

There was an acute consciousness among Socialists that the Labour party had reached a turning point in the development of its doctrine and policy. Two general elections had demonstrated to the satisfaction of its parliamentary leaders that nationalization could no longer be the main plank of its platform. It had gone to the country as the defender of the social services but this role imposed on it the duty of suggesting some means of paying for them out of the national income. The choice was clearly formulated in the last year of Clement Attlee's administration when Aneurin Bevan and Harold Wilson had resigned on the grounds that the country could not afford the vast rearmament program on which the government had embarked without making deep inroads into the welfare state. The party leadership insisted on putting defense first, and it became increasingly hard for them to resist the logic of the rebels who contended that this could be done only at the cost of such sacrosanct institutions as the health service. Over and above this critical question and intimately connected with it was the problem of what Labour, the party of social progress, could now offer in the way of new legislation.

The Bevanites favoured economy on rearmament; maintenance and, at points, extension of the social services; more independence of the U.S. in foreign policy; and, in the opinion of Bevan himself, more nationalization.

Matters came to a head at the Trades Union congress which was held at Margate in early September and at the party conference at Morecambe in early October. At Margate an eloquent resolution comprehensively condemned the government's economic policy, but on the issues which mattered—rearmament, foreign policy and wage restraint—caution prevailed. While calling for further increases in the wages of the lowest paid groups, the conference tacitly accepted the general policy of restraint.

The party conference at Morecambe met in a white heat of passion and started with a resounding victory for the Bevanites, all six of their candidates being elected to the executive as constituency representatives and Herbert Morrison and Hugh Dalton being eliminated in the process. Thus encouraged, the Bevanites pressed their views on rearmament, foreign policy and nationalization in a series of resolutions and amendments. These were duly defeated but only by the use of the card vote which enabled the delegates of the unions to vote with the full strength of their membership for whatever course had been agreed on beforehand. By this method the unions inflicted a crushing defeat on the constituencies, but the strength of Bevanism among the constituencies had already been conclusively demonstrated.

Since the Liberal party conference at Hastings in May was concerned mainly with the reiteration of familiar themes and with the discussion of internal party arrangements to meet the financial consequences of the last two general elections, and since the Communists, as an overt political force, remained negligible in Britain, all attention was fixed by the end of the year on the dilemmas of the two great parties. The Tories had embarked on a policy which, taken even one step further, must lead to some more or less serious diminution in the various forms of official bounty by which parties earn popularity. The

Socialists, while they might rely on some support in the country as government economies became more stringent, were bitterly and publicly divided among themselves. The party leadership resolutely declined either to retreat toward public economy or to advance toward a radical policy of intensified control, while the Bevanites stridently demanded a new Socialism and a complete reorientation of national foreign policy. (T. E. U.)

Political Parties, U.S. Distribution of Party Strength.

—At the opening of 1952, the governments of 18 of the 48 states were under the control of representatives of the Republican party. In an equal number of states, representatives of the Democratic party were in control of the government. In a dozen states there was a divided control. These states included Colorado, Connecticut, Delaware, Maryland, Massachusetts, Minnesota, Montana, New York, Nevada, Utah, Washington and Wyoming. In the congress of the United States, Democratic majorities prevailed in both house and senate, and the president, with a great body of political appointees, was the leading representative of the Democratic party, as had been the situation since March 1933.

Active candidates for the Republican presidential nomination were already in the field in January, including Sen. Robert A. Taft of Ohio, Gov. Earl Warren of California and Harold E. Stassen, formerly governor of Minnesota. A group of well-known Republican leaders, most of them in eastern states, had also organized to further the possible candidacy of Gen. Dwight D. Eisenhower.

There was a general feeling that the Republicans would have

"THE ELUSIVE GROOM!" a cartoon by Packer published in the *New York Daily Mirror* in 1952

their best chance since the election of 1928. One of the reasons was definite uncertainty as to the choice of the Democratic leader; another was the vulnerability of the Democratic record on communism, on corruption and on the indecisive war in Korea. There was a widespread opinion that the contest would eventually be one between Taft and Chief Justice Frederick M. Vinson, known to be a great favourite of Pres. Harry S. Truman. The widespread but nonpartisan popularity of General Eisenhower led to a view that he might find it easier to win an election than to win the Republican nomination.

A growing appreciation of this view led to renewed discussion of the way presidents were chosen. It was pointed out by political commentators that in 32 states the choice of delegates to national conventions was in the hands of professional politicians from the time of the local precinct meetings to the date of the choice of delegates by the state party conventions. In only 16 of the states were there primaries to elect delegates to state conventions, and in 3 the primary was optional. In the two national conventions, although ample opportunity was always given for presentation of candidates and resolutions, direction was in the hands of approximately 1,500 professional politicians engaged in operating the national political machine. Two professional groups were to choose two candidates, one of whom the voter in November was expected to support at the polls. Of course, minor parties were free, in the United States, to function outside this pattern of practice, and had done so for more than 100 years. They did so in 1952, and eventually 12 party nominations were made.

Despite the fact that many experienced politicians, including the president, placed little value on state primaries except as "popularity contests," the primaries held in 16 states between March 11 and June 3 were looked upon by the public at large as important tests of the political strength of the various candidates in the following conventions. In the first trial of strength in New Hampshire, General Eisenhower won a substantial victory in the Republican primary, and Sen. Estes Kefauver of Tennessee was preferred to President Truman in the Democratic primary. In the Minnesota preferential primary on March 18, won for Republicans by former Governor Stassen, Eisenhower was given a phenomenal "write-in" vote.

Early in the year there was renewed discussion of a salient fact in U.S. politics; namely, the large percentage of eligible voters that customarily stayed away from the polls. It was pointed out that approximately 50% abstained from voting in the presidential election of 1948. The bureau of the census reported 98,000,000 eligible voters and 75,000,000 registered voters. There were nearly 2,000,000 more women than men on the eligible lists.

Contests for 35 senate seats were second in importance only to the contest for the presidency. To be elected were 435 representatives to the house, as well as governors in 31 of the states. It appeared at the outset that the Democrats had the advantage in the races for the house because of local conditions. Between Feb. 19 and Sept. 24 there were 57 nominating primaries to choose senators, representatives and governors. Nine of these were "runoff" primaries; that is, in reality final elections. Moreover, it came to be realized that a Republican presidential victory was no sure guarantee of a Republican majority in the senate. It was well known that at the close of 20 years of national dominance, Democrats had come to occupy the majority of judicial posts. Eight of nine justices of the supreme court were Democrats. In the United States courts of appeals, 53 of 65 judges were Democrats; in the district courts, 168 of 211 were Democrats.

Early Divisions in the Major Parties.—During the first three months of the year, the activities of political party organiza-

tions increased steadily, particularly at the local level. In this period the candidacy of Senator Kefauver made a deep impression, particularly after he won the New Hampshire primary. Early talk of the possible candidacy of Adlai E. Stevenson, governor of Illinois, subsided because of his declaration that he would not seek the Democratic nomination. Sen. Richard B. Russell of Georgia came forward as the probable choice of the southern Democrats. The publication in March of the book *Mr. President*, edited by William Hillman and based upon diaries and letters of President Truman, increased the discussion of the latter's possible renomination. But this matter was resolved by President Truman's declaration at the Jefferson-Jackson dinner on March 29 that he would not run.

From early April, when Taft began in Wisconsin his impressive march in primary victories, until the eve of the Republican convention, the attention of the nation was centred upon the contest between Taft and Eisenhower for delegates to the convention, rather than upon the increasing acrimonious contest within the Democratic party. Kefauver gained steadily in primary support. By mid-May, many felt certain that he would win the Democratic nomination; he claimed support of more than 3,000,000 in the primaries. But in the final arrangements for the forthcoming Democratic convention, it was noted that the party managers had chosen Gov. Paul A. Dever of Massachusetts and Speaker of the House Sam Rayburn of Texas as presiding officers, and this seemed to thoughtful commentators to forecast the choice of Governor Stevenson. By the end of the month Washington correspondents felt that the ticket would be Stevenson and Russell.

The Republican contest narrowed to a struggle between Taft and Eisenhower. In late May, Taft managers claimed 450 delegates to the convention and 107 as a probable addition. It seemed likely that the two candidates would enter the convention with somewhat more than 500 delegates to the credit of each (604 Republican and 616 Democratic required for nomination). The favourite sons, in particular Governor Warren of California and former Governor Stassen of Minnesota, might hold the balance of power. But the leading question was the determination of delegations from contests submitted in Texas, Louisiana and Georgia. It appeared that the outcome of this issue might determine the choice of the nominee. Consequently, when, in the preliminary organization of the convention, the Republican national committee gave every advantage to Taft in choice of presiding officers and invited speakers, there was increasing discussion of the possibility of so serious a split in the party as to suggest a repetition of the split of 1912 and, as well, the loss of the ensuing election.

The National Party Conventions.—An analysis of the proceedings of the Republican convention, which opened on July 7, showed that the final outcome was determined by three factors of outstanding significance. In the first place, the presentation of the regular party program by Gen. Douglas MacArthur, by former Pres. Herbert Hoover and by others gave assurance that the party would oppose the New Deal, the Fair Deal and "Trumanism" on both domestic and foreign policies. In the second place, the reports from regularly organized committees (constituted by the Republican national convention of 1948) were scrutinized by the convention membership, which thereupon insisted on a delegate list from the contested states of Texas, Louisiana and Georgia that gave greater support to Eisenhower than to Taft. This decision of the convention was aided by two factors: the support of the machine and personnel of the titular head of the party, Gov. Thomas E. Dewey of New York; and the call of the Republican governors of 25 states for fair and honest dealing with the evidence submitted by the Texas, Louisiana and Georgia rival delegations to the convention where

all could see and judge. In the third place, the insistent mood of the convention was distinctly hostile to the idea of a usual nomination, and in this mood the convention membership chose with determination the nomination not of Taft, not of a favourite son, but of Eisenhower, who, it was the general belief, could win the election.

The Republican platform was affirmative and aggressive, as well as evasive and vague. It was primarily a program of attack, as was natural in the case of a party that had been out of office for 20 years. The choice of Sen. Richard M. Nixon of California as vice-presidential candidate, appealing supposedly to younger voters, was an indication that no risk was to be taken in being "too conservative," and that there was intention to bear down hard on anticommunism as an issue in the ensuing campaign.

The conventions, both held in Chicago, the Republican from July 7 to 12 and the Democratic from July 21 to 26, brought to the one city all the principal contenders for nomination, which was unprecedented. As the sessions were televised for the first time, as well as presented to the world by radio, there were brought to the eyes and ears of millions of Americans and others the methods, manners and membership of both the party organizations. Never before had the "party" as a living force in American life been so completely revealed to the people.

In the Democratic convention there was a contest not of two candidates but of six: Averell Harriman (Mutual Security administrator), Senator Russell, Senator Kefauver, Vice-Pres. Alben W. Barkley, Sen. (former Gov.) Robert S. Kerr of Oklahoma and Governor Stevenson. Involved in these candidacies, but in the end not determining the nomination, were the highly controversial platform proposals on civil rights and labour relations. More important than either—and to some extent determining the final outcome—was the treatment accorded the States' Rights Democrats of 1948. As pleas of the southern moderates proved successful, it was clear that the party would appear to be united. The proposals of extremists were rejected. This in turn meant that the nominee could not be Russell or Kefauver or Harriman. As Barkley had withdrawn and Kerr was not a serious contender, the nominee would be (and was) Stevenson. The vice-presidential nominee was Sen. John Sparkman of Alabama.

The Campaign.—The briefest summary of the campaigns of the two parties from mid-August until election day on Nov. 4 would include, in order, the following salient developments. Eisenhower's earliest speeches stressed "honesty in government," the need of a lasting peace and the "appalling and disastrous mismanagement of our foreign affairs." Following his meeting with Taft on Sept. 12, there appeared greater intensity in Eisenhower's charges against the Truman administration, and it was apparent that he was working, in speeches and otherwise, upon pacification of the Republican conservatives. His supporters had taken control of the national committee. His support of Sen. William E. Jenner of Indiana and Sen. Joseph R. McCarthy of Wisconsin was given in his determined effort not to lose any possible Republican support, not only in winning the presidency but in assuring a Republican majority in the senate. However, Republican Sen. Wayne Morse of Oregon announced that he would not support Eisenhower. Later in the month Senator Taft gave the first of 16 speeches in support of the Republican ticket.

In this same period Stevenson had chosen a staff of workers that emphasized his freedom of the regular Democratic organization. Stevenson was invited to the White House and not only counselled with the president but on Aug. 12 was given a "briefing" by government and defense officials. This proved to be a major political blunder. Even though General Eisenhower was

subsequently, and apparently as an afterthought, invited for a similar briefing, the political harm was done. The declaration by Eisenhower that he had declined this invitation gave him a tactical advantage, and it really lost him nothing, for he had before him each week the confidential reports of the Central Intelligence agency.

As the campaign went into its second month, it was abundantly clear that an agreement had been reached between candidate Stevenson and President Truman, and that, although the Democratic candidate would go his own way, the president would in the last weeks of the campaign make it clear to all supporters of the Fair Deal that it was on trial. In the meantime, Stevenson increasingly attacked the methods of Eisenhower in solidifying his support by saying that a "great crusade" had become a "great surrender."

The last half of September was given over to the discussion of money in politics. It began on Sept. 18 with the revelation that vice-presidential candidate Nixon had accepted \$18,235 for political purposes from a group of supporters. Early reaction was very unfavourable. This was countered by the news that Stevenson had used money from his gubernatorial fund of 1948 to augment salaries of state officials. An attempt was made to draw a fine line of distinction between the two acts, but to the public as a whole it failed. Nixon submitted his case to the Republican national committee and defended himself as well on Sept. 23 in a radio broadcast that excited great interest. The popular response seemed to exonerate him. The Republican national committee reported the receipt of 75,000 messages, 200 to 1 in Nixon's favour. Eisenhower stated that Nixon had been completely vindicated. Even after interest subsided, however, there was a widespread feeling of unrest and uncertainty as to the extent of contribution of private funds for campaigning.

Anticommunism, which had been an ever-present subject of discussion, came definitely to the centre of the stage in Nixon's attacks upon Stevenson, because of his character witness deposition on behalf of Alger Hiss. The counterattack of Democrats pointed out that Eisenhower and his close adviser, John Foster Dulles, had been members of the board of the Carnegie Endowment for International Peace that had chosen Hiss as its president. But not until Monday of the final week did Senator McCarthy, speaking not for the Republican national committee but as guest of a group of Chicago friends, present once more before a national audience his conception of the danger to the nation in the presence in the government of Communists and near-Communists. In this he attempted to link Stevenson with "fellow travellers" and organizations on the list of the senate un-American activities committee. The Democratic national committee published a point-by-point refutation. But the impression remained among all those accustomed to the charges of the past two years. It gave occasion also to the issuance of reports that accepted precedents would be broken; Florida and Virginia and possibly Texas would vote for Eisenhower.

In the final week of the campaign, although communism as a menace at home and abroad certainly was much in the minds and emotions of the voter, the issues upon which all major addresses concentrated were charges of inexcusable corruption in Washington, the economic record of the administration and, finally, the part of the United States in the war in Korea. Eisenhower's attack, leading to his repeated declaration of intent to go to Korea, brought derision and then violent denunciation, not only from Stevenson and Truman but from other Democratic speakers. But there was no effective answer even in the Democratic candidate's statement that the solution lay not in Korea but in Moscow. That broadened the argument, but left the administration even less defensible. The issue continued at the forefront to the eve of the election, President Truman re-

leasing top secret information in reports of 1947 on Korea, and Lieut. Gen. Albert Wedemeyer in a national broadcast disputing the facts as presented by Senator Morse and President Truman. In his final appeal made in Boston, with a national radio and television audience, Eisenhower emphasized five guiding moral principles, but rested his case on attainment of peace. President Truman, in predicting victory for the Democrats, said, "We are going to win for the policies that have made our country prosperous, the policies that have given every man a better opportunity and saved the free world from Communism."

All national surveys predicted a close election. It was anticipated that the unusual interest evident in greatly increased registration would be reflected in a national vote reaching perhaps 60,000,000. National political parties, in organization and in leadership, had never played so large a part in the thinking and feeling of the electorate as during this long and uncertain campaign.

The minor parties rarely appeared in public discussions of the campaign. The nominee of the Independent Progressives, Vincent Hallinan, contented himself for the most part in denouncing both the Democratic and Republican parties as "warmongers." The Socialist appeal was usual, and, in absence of an aggressive nominee, received little attention. In New York state the Liberal party had a state ticket but gave its national support to the Democratic nominee, who addressed them in a special broadcast the week before the end of the campaign. (For the results of the election, see ELECTIONS, U.S.; see also COMMUNISM; SOCIALISM; UNITED STATES.) (E. E. R.)

Political Science. During 1952 representatives of a dozen nations ranging as widely as Mexico and India, Great Britain and the United States, met in Cambridge, Eng., to put the finishing touches on a report dealing broadly with the scope and purpose, aims and problems, of international political science. In addition to the obvious academic value of such collaborative effort, the immediate practical necessity was to provide so-called underdeveloped countries with a better knowledge of how to organize governments and train leaders so as to cope with problems of industrialization and growth.

As of 1952, it might be said that there were three main currents or emphases more or less differentiating the treatment of political science in the various countries. There was the legal tradition of the European continent, the historical-cultural method of British universities, and the more nearly autonomous and scientific emphasis of the United States. When in 1951 the American Political Science association published its study, *Goals for Political Science*, which was the product of a committee study extending over four years, it was found that there were 5,000 persons teaching political science in U.S. colleges and universities, that more than 300 of these institutions provided a major in the subject, that 112 offered the master's and 41 the doctor of philosophy degree in political science, and that 70% of the departments were organized on an independent (discrete, separate) basis.

The greatest demand for students trained in this field was in law (where political science is a popular prelegal subject); for entrance into the public service and especially into the administrative branch (in 1952 the latter accounted for 95% of all employment opportunities); and for work in the fields of diplomacy, journalism, civic organizations and the like which, although no one of them afforded large numbers of openings, were among the most important areas of professional endeavour. The subjects that had become most popular among students were public administration and international relations, the former because of its obvious vocational pertinence and the latter because of the rapidly accelerating importance of compara-

tive government and world politics.

Eight subdivisions of political science had been recognized by the American Political Science association: political theory and philosophy; political parties, public opinion and pressure groups; legislatures and legislation; constitutional and administrative law; public administration; government and business; international law and relations; and United States government and comparative government. Scientific methods of investigation were principally applied in the area of political behaviour, what causes it and how to predict it; with regard to certain phases of public administration such as the principles of organization; in studies of the sources and methods of political power among competing nations; and in the attempt to develop an over-all theory of the factors inducing permanence and change. Illustrative of what may be called the American approach is Robert M. MacIver's book, *The Web of Government* (1948).

In the British tradition, political science had long been a basic subject in the historical-cultural concentration, but until recently there had been few evidences of autonomy or specialization. The Oxford "Modern Greats," for example, was a combination of politics, philosophy and economics. In Britain it was only at the London School of Economics and Political Science that there was a clearly established department of political science covering most branches of the subject usually found in the United States.

Wherever political science was simply a branch of the faculty of law, which was the continental tradition, the emphasis was inevitably juristic. In some cases, as at the University of Paris, the law faculty had become, in effect, a faculty of social science dominated by law. As in economics, sociology and all the other social sciences, the student of political science was required to take basic subjects possessing purely legal interest before he could proceed. One result of this pattern was the organization of autonomous schools of political science outside the faculties of law. Examples were the Free School of Political Sciences and the National School of Public Administration in France, the Advanced Schools for Politics in Berlin and Wilhelmshaven, Ger., and similar institutions of recent origin in Mexico, Egypt, Greece, Poland and Yugoslavia.

The trend away from the strictly legal to a broader conception of political science had become most marked in countries such as France and the United States where once the legal emphasis predominated. British universities were as determined as ever not to forsake their cultural tradition for a vocational one, but at the same time they saw a need for more research and training in the governmental arts, which had come to influence so much of community life. In the United States, on the other hand, there was a broadening of the subject to include related emphases and contributions such as those from psychology and anthropology, with the result that in that country the need was perhaps for a greater degree of integration than had formerly existed.

Thus in 1952 it was clear that international relations as a subject of intensive study would grow in importance. It was concerned with basic concepts of political science such as sovereignty, nationalism, law and power conflicts. It was expected that the methods of analysis in political science would be extended so as to make a more effective impact on stubborn problems such as war. With government employing from 8 to 10 people out of every 100 of the population in liberal, democratic countries such as the United States, and with governments administering so many programs of great intricacy and scope, there was a growing need to train future leaders for legislatures, political parties, the foreign service and the numerous cadres of public administration. How to square the equally legitimate de-

mands of professionalization and a liberal arts education was no easy assignment for the universities. Finally there was the vexatious problem of what to do about citizenship education. As the responsibilities of government increase, so also do the duties of the citizen increase. Can citizenship be taught, and if so, should political science bear a major share of the responsibility? At the international conference at Cambridge in 1952 opinion was sharply divided on this issue, some arguing that so long as teaching is objective instead of doctrinaire, citizenship should be taught to everyone, the opposition contending that the dangers of propaganda and indoctrination are so great that such efforts are unduly hazardous.

As the year drew toward a close, these were some of the policy decisions that had to be made as political scientists in many parts of the world faced the future. The profession was a steadily growing one, for the problems with which political scientists deal are as imperative as war, slum clearance and the freedom of the individual. (M. E. DK.)

Polo. The Beverly Hills Polo club won the national open championship on June 1, 1952, when it defeated San Francisco, 9-6, in the final on its home field at Los Angeles, Calif. Bostwick field at Old Westbury, L.I., N.Y., was the scene of the United States 20-goal competition, which was won by the Meadow Brook club, Long Island, when it routed the Milwaukee Shamrocks, 12-1, on Sept. 28. The Shamrocks gained some measure of satisfaction in the final of the Monty Waterbury handicap tournament at Westbury on Oct. 4 when they topped Meadow Brook, 7-6. The Blind Brook Polo club of Purchase, N.Y., gained the national 12-goal championship by default on Oct. 5 when Meadow Brook was unable to field its team for the final round. Bostwick field annexed the Hempstead cup, and the Brandywine Polo club of Philadelphia carried off the trophy in the 16-goal Autumn Plates play. Pittsfield, Mass., Northeastern titleholder, won the national intercircuit honours by defeating the Milwaukee Shamrocks, the Central champions, by 13-7. A series between a California four and the El Trebol riders of Argentina at Los Angeles featured international competition. The coast four triumphed by taking the third contest, 6-4, after winning the first game by 8-7 and losing the second by 8-7 in overtime.

The New York Athletic club captured two of the major titles during the indoor season, winning the national senior crown and Eastern 12-goal laurels. New Jersey riders triumphed in the annual Sherman Memorial cup tourney, and the New Mexico Military institute took national intercollegiate laurels. (T. V. H.)

Portugal. A republic of southwestern Europe, forming part of the Iberian peninsula, Portugal is bounded east and north by Spain. Area: 35,415 sq.mi., including Azores (888 sq.mi.) and Madeira (302 sq.mi.). Pop.: (1940 census) 7,722,152; (1950 census, prelim.) 8,490,455, including Azores (318,686) and Madeira (269,179); (1951 est.) 8,606,000. Language: Portuguese. Religion: Roman Catholic. Chief towns (pop., 1940 census): Lisbon (cap., 709,179); Oporto (262,309); Funchal, Madeira (54,856); Coimbra (35,437). President of the republic in 1952: Gen. Francisco Higino Craveiro Lopes; prime minister: Antonio de Oliveira Salazar.

History.—On the last day of 1951 a new steel-arch bridge over the Tagus river was opened by the president of the republic at Vila Franca de Xira, about 40 mi. above Lisbon. It was the longest in Portugal and one of the major bridges of the European continent.

The ninth session of the council of NATO (the North Atlantic Treaty organization), which met in Lisbon, Feb. 20-25, was the most notable of a series of international gatherings in the Portuguese capital during 1952. Among others were the European committee of the World Health organization, the U.N. Food and Agriculture organization, the International Wheat council, the International Congress of Industrial Medicine, the fifth International Congress of Neurology, the International Roads congress, the congress of the International Housing and Town Planning federation and, at Fátima, the ceremonial closing of the Holy Year celebrations.

Prime Minister Salazar crossed into Spain to meet Gen. Francisco Franco for a two-day conference at Ciudad Rodrigo in April. It was understood that problems related to the defense of the Iberian peninsula were the principal object of the meeting.

In June the terms of the 1951 agreement with the United States for the granting of military facilities in the Azores were made public: it transpired that Portugal had reserved the right to extend similar facilities to Great Britain and possibly to other members of NATO if the need should arise. A project for the reform of military aviation became effective by the establishment of an undersecretaryship for aviation directly responsible to the minister of national defense. Ruy Luis Gomes, a former presidential candidate, was sentenced to three months' imprisonment and five years' loss of civil rights for "conspiring against the security of the state."

The financial year 1951 was closed with a credit balance of 47,000,000 escudos. New trade and economic agreements were concluded with France, Ireland, the United Kingdom, Denmark, the German Federal Republic, Sweden, Belgium and Italy; various other agreements of a similar nature were revised or renewed. The 1952 budget provided a sum of 180,000,000 escudos for health and other social services, and 592,000,000 escudos as the first of three approximately equal annual instalments for the rearmament program in fulfilment of Portugal's international obligations as a member of NATO.

Further developments in the national electrification scheme were the completion of the system at Cávado-Rabagão in northern Portugal, and formal authorization of a new hydroelectric system for the island of Terceira in the Azores at a cost of 26,000,000 escudos. The ambitious plan of national development, details of which were published in September, provided for an estimated capital expenditure of 13,500,000,000 escudos in six years. This was nearly two and a half times the annual national budget. (F. B. H.)

Education.—Schools (1948-49): primary 10,646, pupils 598,190, teachers 14,445; private elementary, pupils 60,158; secondary 42, pupils 19,997, teachers 1,096; private secondary, pupils 25,316; technical 67, pupils 36,533, teachers 1,591; commercial 8, pupils 3,095, teachers 217. Colonial high school, students 113, professors 15. Universities 3, students 8,883, professors and lecturers 475; other institutions of higher education 4, students 5,576, professors and lecturers 278. Illiteracy (1940): 49%.

Finance and Banking.—Budget (1951 actual): revenue 4,100,000,000 escudos, expenditure 5,177,000,000 escudos. National debt (1950): 12,337,000,000 escudos. Currency circulation (June 1952): 8,370,000,000 escudos. Bank deposits (June 1952): 20,240,000,000 escudos. Monetary unit: escudo, with an exchange rate (Nov. 1952) of 80.50 escudos to the pound sterling and 28.95 escudos to the U.S. dollar.

Foreign Trade.—(1951) Imports 9,497,000,000 escudos; exports 7,561,000,000 escudos. Main sources of imports (1951): U.K. 17%; Portuguese overseas territories 16%; U.S. 16%. Main destinations of exports (1951): Portuguese overseas territories 25%; U.K. 17%; U.S. 13%. Main imports (1951): wheat 8%; machinery and vehicles 23%; coal, petroleum and products 11%; raw cotton 6%. Main exports (1951): cotton fabrics 13%; cork and manufactures 17%; port and other wines 11%; sardines and other canned fish 10%.

Transport and Communications.—Roads (1949): 16,697 mi. Licensed motor vehicles (Dec. 1950): cars 65,000; commercial vehicles 24,000. Railways (1949): 2,246 mi.; passenger-miles (1949) 917,000,000; freight carried (1950) 3,324,000 metric tons. Shipping: merchant vessels 100 gross tons and more (July 1951) 319; total tonnage 501,985. Telephones (1951): 152,580. Radio receiving set licences (1949): 187,385.

Agriculture.—Main crops (metric tons, 1951): wheat 604,000; barley 137,000; oats 147,000; maize 422,000; rye 196,000; rice, paddy, 127,000; potatoes 1,208,000; dry beans 55,000; grapes (1949) 1,360,000. Wine production (1950): 7,250,000 hl. Olive oil production (1951 est.): 82,000 metric tons. Livestock (Dec. 1948): cattle 1,000,000; sheep 4,000,000; pigs 1,200,000. Meat production (1951): 72,000 metric tons. Fisheries, total catch (1951): 307,455 metric tons.

Industry.—Fuel and power (1951): coal 417,600 metric tons; lignite 82,800 metric tons; manufactured gas 43,800,000 cu.m.; electricity 1,034,000,000 kw.hr. Raw materials (metric tons): lead (1950) 2,040; tin ores (1949) 2,654; wolframite (1950) 2,199; pyrites (1950) 613,521; cork (1949) 103,108; kaolin (1949) 21,941. Manufactured goods (metric tons, 1951): cement 639,600; woven cotton fabric 25,700; cotton yarn 31,600.

Portuguese Overseas Territories. Under this heading are grouped the Portuguese possessions in Africa and Asia. Their total area is approximately 803,835 sq.mi. and the total population (mid-1950 est.) 11,986,371. Areas, populations, capital towns and governors of the territories are given in the accompanying table.

History.—The six-year national development plan envisaged capital expenditure of between 5,000,000,000 escudos and 6,000,000,000 escudos in the overseas provinces, principally in Angola and Mozambique. Irrigation, agriculture, hydroelectric schemes and the improvement of railway and air communications and port facilities were among the principal projects. Some of these made good progress in 1952, including the extension of the railway line from Moamba to Guijá (Mozambique) and the Limpopo bridge barrage. It was reported that the new port of Nacala in northern Mozambique was expected to be one of the best ports on the east coast of Africa within a relatively short space of time.

Statistics were published, covering the year 1951, showing considerable increases in coffee and sisal production in Angola. U.S. grants for colonial development under the Economic Cooperation administration totalled 62,000,000 escudos.

Radiotelephone communications between metropolitan Portugal and the overseas territories were expanded by the inauguration of new services to Angola, Cape Verde and São Tomé. New radiotelephone installations at Goa, Macao, Timor and Portuguese Guinea reached an advanced stage of completion. Telephone rates to Mozambique were reduced by more than 50%.

The far eastern tour of Commander Sarmento Rodrigues, minister for the overseas territories, ended in Macao just prior to a shooting incident between Portuguese and Chinese guards which resulted in the temporary closing of the international frontier in July. Some delicate diplomacy on both sides brought about an amicable settlement of the affair, under which Portugal paid an indemnity. The 400-year old peace was re-established and Macao remained a curiously unchallenged outpost of "west-

ern imperialism" in the Chinese people's republic.

In the enclaves of Goa, Damão and Dio there was not the same apparent calm toleration on the part of India. Portugal firmly maintained that its ancient Indian footholds were an integral part of the Portuguese republic, and that their status as such could not be altered. India continued to resent this attitude and remained determined to free all the enclaves from non-Indian rule. Meanwhile commercial and economic relations between the territories and India suffered from the effects of the Indian customs cordon and from smuggling and other forms of lawlessness in the border areas.

(F. B. H.)

Angola.—Education: primary schools (1948) 142, pupils 9,007; secondary (1947) 21, pupils 2,239; technical (1947) 17, pupils 783. Budget (1950 est.): balanced at 845,246,000 angolars. Monetary unit: angolar at par with the escudo. U.S. \$1=28.95 escudos. Foreign trade (1951): imports 2,172,000,000 escudos, exports 3,192,000,000 escudos. Roads (1949): 21,772 mi. Railways (1949): 1,771 mi. Shipping (1949): vessels entered 3,748, net tonnage 3,638,530. Principal products: maize, sugar, coffee, beans, sisal, palm oil, diamonds.

Cape Verde Islands.—Education: primary schools (1948) 111, pupils 5,234; secondary (1947) 1, pupils 257. Budget (1950 est.): balanced at 33,550,000 escudos. Foreign trade (1950): imports 245,900,000 escudos, exports 227,600,000 escudos. Shipping (1949): vessels entered 4,126, net tonnage 2,807,822. Principal products: mineral oil, coal, fish.

Guinea.—Budget (1950 est.): balanced at 74,650,000 escudos. Foreign trade (1949): imports 142,200,000 escudos, exports 160,800,000 escudos. Shipping (1948): vessels entered 83, net tonnage 103,502. Principal products: peanuts, coconuts, palm oil.

São Tomé and Príncipe Islands.—Budget (1950 est.): balanced at 41,996,000 escudos. Foreign trade (1950): imports 109,100,000 escudos, exports 209,500,000 escudos. Shipping (1948): vessels entered 118, net tonnage 45,862. Principal products: cocoa, coconuts, copra, palm oil.

Mozambique.—Education (1949): elementary schools 850, pupils 137,805; primary 127, pupils 10,254; secondary 6, pupils 784; technical 57 including 3 teachers' training colleges, students 5,991. Budget (1951 est.): balanced at 1,535,650,462 escudos. Foreign trade (1951): imports 2,044,000,000 escudos, exports 1,252,000,000 escudos. Roads (1949): 18,078 mi. Railways (1949): 1,652 mi. Shipping (1949): vessels entered 1,988, net tonnage 6,905,468. Principal products: sugar, copra, cotton, sisal.

Post Office. **United States.**—Revenues of the post office department for the fiscal year 1951-52 amounted to \$1,947,316,280.38. Additional postage that would have been collected if the service had been on a regular pay basis in the case of penalty and franked mail, free-in-county mail, differentials in second-class mail matter and free matter for the blind and the cost of aircraft service over the postage revenue derived from air mail was estimated at \$107,200,000.

The expenditures of the department for the fiscal year amounted to \$2,666,860,370.81, of which amount \$169,381,411.46 was on account of prior years. There was \$176,887,538.40 unpaid on account of the 1952 fiscal year. This left a total expense of \$2,674,366,497.75, resulting in a gross operating deficit on accrual of \$727,050,217.37.

During the fiscal year ended June 30, 1952, 1,446,500,000 free pieces weighing 107,622,000 lb. were mailed for other government departments, an increase of 207,000,000 pieces and 16,600,000 lb. over 1951.

On June 30, 1952, war savings stamps were on sale at 40,919 offices. Sales from July 1, 1951, to June 30, 1952, amounted to \$17,042,051.55. During the fiscal year savings bonds with a sale value of \$269,177,062.50 were sold. At the close of the fiscal year 1952, bonds were on sale at 26,167 post offices.

Through the 40,919 post offices and 4,148 stations being conducted under contract agreement, as well as 2,438 stations and branches, there were received in the domestic mails

Portuguese Overseas Territories

Country	Area (sq.mi.)	Population (1950 census)	Capital	Governor

*1949 census. †His title is governor general.

AUTOMATIC MAIL ROUTING machine in use at Antwerp, Belg., in 1952 and of interest to U.S. postal authorities for possible adoption. As letters passed before the sorter on a conveyer (from right), he pressed buttons keyed to proper boxes of destination, sorting about 200 a minute

and from foreign sources, transported and delivered 49,741,000,000 pieces of mail matter during the fiscal year, having a weight of 11,534,000,000 lb., an increase of 2,833,000,000 pieces but a decrease of 375,000,000 lb. from the previous year.

During 1952 it was impossible to deliver 22,797,455 letters, a decrease of .60% from the previous year. A total of 3,456,612 letters were returned to senders. Letters containing valuable enclosures numbered 459,687, of which 97,855 contained money amounting to \$256,339.00. There were also 901,231 unclaimed parcels and articles found loose in the mails. Of these, a total of 139,924 were returned to the senders. The remaining 761,307 parcels were sold at public auction and \$350,366.82 was realized.

On June 30, 1952, there were 162,167 mi. of domestic air-mail routes in the United States—a decrease of 833 mi. from the previous year.

Rural Delivery.—The rural delivery routes in operation on June 30, 1952, required a total daily travel of 1,492,935 mi. by rural carriers in providing service to approximately 33,586,628 patrons. Operation of the service resulted in an expenditure of \$188,911,662 for the fiscal year, compared with \$168,762,382 for the previous year.

Postal Savings.—Postal savings depositors numbered 3,339,378 for 1952, a decrease of 5.39% from the preceding year. The balance due depositors by outstanding certificates of deposits was \$2,617,234,673, a decrease of \$170,683,571, or 6.12%. In addition there was held in trust for depositors accrued interest of \$108,407,638.33 and unclaimed deposits of \$329,463.00, making a total of \$2,725,971,774.33.

Buildings.—During the fiscal year ended June 30, 1952, the post office department operated 3,173 government-owned buildings.

During the fiscal year air-mail service by helicopter was inaugurated between LaGuardia airport in New York city and the International airport—Idlewild, and between the International airport and Newark, N.J. Helicopter service was also in existence at Los Angeles, Calif., and Chicago, Ill., and had been extended to certain towns in New York state and Connecticut.

Since the inauguration by the post office department of the system of carrying bulk mails on short hauls by trucks under

the star route law instead of by railroads, 325 such routes had been placed in operation by June 30, 1952. This service had resulted in a substantial saving in the cost of transportation of bulk mail. (See also AVIATION, CIVIL.) (I. Gg.)

Canada.—In March 1951, after many years of surplus operation, the Canadian post office showed a deficit of about \$1,300,000. Accordingly, the department raised the rates on various classes of mail and effected economies, such as cutting urban mail deliveries from twice a day to once a day. Such activities reduced expenditures during the 1951-52 fiscal year by about \$8,500,000, to a total of \$98,300,000. Revenues amounted to about \$104,000,000. Thus, at the end of the 1952 fiscal year the department again showed a surplus. Among the stamps issued during 1952 were: a blue 4-cent to honour the Red Cross; a blue 7-cent air mail carrying a drawing of a Canada goose in flight; an orange 4-cent with the picture of Alexander Mackenzie, Canada's second prime minister; and a purple 3-cent with a picture of Sir John J. C. Abbott, fourth Canadian prime minister. (See also PHILATELY.) (C. Cy.)

Potash: see MINERAL AND METAL PRODUCTION AND PRICES.

Potatoes. Instead of a surplus to be destroyed or wasted as during most of the years when white potato prices were supported in the United States, there was an acute shortage during the first half of 1952 following the small unsupported 1951 crop of 325,708,000 bu. The indicated 1952 crop (also not price-supported) of 345,561,000 bu. was small compared with the 414,525,000 bu. average for 1941-50. The 1,418,000 ac. for harvest were 4.8% more than in 1951, but a sharp decline compared with the 2,401,000 ac. harvested as an average for 1941-50. High prices at planting time favoured expanded acreage and, though plantings did exceed farmers' early intentions of only 1,373,000 ac., they were short of the officially suggested goal of 1,475,000 ac. The yield of 243.7 bu. per acre was slightly larger than the 240.7 bu. of 1951 and substantially

Table I.—U.S. Potato Production by Leading States

(In thousands of bushels)

State	Indicated 1952	1951	Average 1941-50
Late Crop			
Maine	51,000	45,835	61,882
Idaho	45,120	37,520	39,312
New York	29,180	27,900	33,183
Colorado	17,390	11,475	12,627
North Dakota	16,280	15,580	19,772
California	14,040	12,800	12,778
Pennsylvania	13,650	16,215	19,990
Minnesota	12,765	11,900	17,209
Oregon	12,060	11,220	10,960
Wisconsin	11,115	9,805	12,820
Michigan	10,730	10,800	16,958
Washington	10,400	11,600	9,905
Nebraska	8,250	6,000	10,518
Ohio	5,000	5,750	7,656
Intermediate Crop			
Virginia	4,644	6,882	8,352
New Jersey	4,625	7,476	11,462
Kentucky	1,596	1,960	3,265
Arizona	1,487	1,387	1,292
Missouri	1,118	1,456	3,022
Early Crop			
California	25,200	21,805	23,610
Florida	7,706	6,321	4,398
North Carolina	5,880	6,909	9,572
Alabama	4,118	4,216	4,047
Texas	2,040	2,204	4,402
South Carolina	2,030	1,937	2,295
Tennessee	1,440	1,539	3,005

higher than the 180.4 bu. of 1941-50. Anticipated consumption per person was 102 lb., 98% as much as in 1951 and 78% of the pre-World War II usage. Maine, as usual, was the leading producer among the late crop states, but the yield per acre was only 375 bu. against 445 bu. in 1951. Prices to producers were at high levels reaching \$3.10 per bushel in June, and in September, as the major part of the crop was coming to market, were \$2.22 per bushel, compared with \$1.23 at the same time

in 1951. Prices rose as much as \$2.00 to \$4.00 per hundred-weight wholesale when price ceilings were removed. Prior to that, blackmarketing was prevalent and numerous prosecutions were begun. Some café chains boycotted potatoes. The futures market was very active and erratic. Spain exported potatoes to eastern U.S., even to Washington, D.C., where the imports sold wholesale for \$5.81 per hundredweight, compared with a \$6.40 ceiling on domestic potatoes.

World production of potatoes in 1952-53 was preliminarily indicated at 7,755,003,000 bu. from 52,109,000 ac., 2% smaller than the 7,892,213,000 bu. from 52,257,000 ac. in the previous year. Europe, excluding the U.S.S.R., produced more than half the world crop. Approximately 75,000,000 bu. entered international trade in 1951, 5% less than in the previous year but 60% above pre-World War II. The Netherlands was the leading exporter, followed by France and Canada. France, the United Kingdom and Spain were leading importers.

Table II.—Potato Production of the Principal Producing Countries
(In thousands of bushels)

Country	1952*	1951	1950	Average 1935-39
U.S.S.R.	2,900,000	2,600,000	2,900,000	2,713,054
Poland	975,000	975,000	1,140,000	1,397,000

*Preliminary.

Sweet Potatoes.—The indicated U.S. 1952 sweet potato crop of 30,814,000 bu., though 9% more than the record small crop of 1951, was only 53% of the 1941-50 average. Indicated civilian consumption per capita was 7.5 lb., 15% more than in 1951 but only 35% of the prewar 21.4 lb. per capita average. The 338,000 ac. for harvest were nearly 10% more than in 1951, but small compared with the 625,000 ac. average for the previous decade. The official goal was 472,000 ac. In spite of serious summer drought in much of the producing areas, the indicated average yield of 91.2 bu. per acre was not much below 1951 (91.8 bu.) or the 1941-50 average of 93.0 bu. per acre. Louisiana, as usual, was the leading producer with more than one-fourth of the total crop (8,400,000 bu.), followed by North Carolina (4,410,000 bu.). Prices to producers at harvest time were about \$3.35 per bushel (55 lb.), compared with \$2.87 per bushel at the same period in 1951. (See also VEGETABLES.)

Prasad, Rajendra (1884-), Indian statesman, was born in the Saran district, Bihar, Dec. 3. He was educated at Presidency college, Calcutta, took his doctorate in law at Allahabad university and in 1914-16 was a professor at the Calcutta university law college. In 1917 he joined Gandhi in the famous Champaran (Bihar) *satyagraha* ("insistence on truth"; i.e., nonviolent disobedience to unjust laws)—an attempt to improve the lot of the peasantry of that district. In 1920 he gave up a promising legal career to devote himself completely to the Mahatma's nonco-operation movement. He became general secretary of the Indian National Congress in 1922 and was president of the Congress in 1932, 1934, 1939 and 1947-50. His only cabinet office was that of member (later minister) for agriculture and food in the interim and fully constituted governments of 1946-48. He was chairman of the constituent assembly from Dec. 1946 and two days before the proclamation of the Republic of India on Jan. 26, 1950, he was named as its first president. On May 6, 1952, Rajendra

POTATO CROP on a farm near Altus, Okla., being patrolled by armed guard to protect the potatoes from pillagers during a nation-wide potato shortage in the spring of 1952

Prasad was declared re-elected as president of the Indian union. He was sworn in on May 13, when he also presided over the swearing-in of the new cabinet.

President Prasad presided over a conference of state governors and *rajpramukhs* in New Delhi on March 14-15. On April 22 he received the credentials of Ernst Meyer, the first ambassador to India from the German Federal Republic. On Oct. 2 he opened the Gandhidam (Kutch)-Deesa (Bombay) railway.

Presbyterian Church. The churches of the Reformed faith, with the Presbyterian form of representative government, in the United States include the following denominations: Presbyterian Church in the U.S.A. (Northern); Presbyterian Church in the U.S. (Southern); United Presbyterian Church; Evangelical and Reformed Church; Reformed Church in America; Associate Reformed Presbyterian Church; Free Magyar Reformed Church in America; Christian Reformed Church; Cumberland Presbyterian Church; Cumberland Presbyterian Church (Colored); Synod of the Reformed Presbyterian Church; Reformed Presbyterian Church, General Synod; Associate Presbyterian Church Synod; Orthodox Presbyterian Church; Bible Presbyterian Church.

The first seven of these churches are constituent members of the western section of the Alliance of Reformed Churches throughout the World Holding the Presbyterian System. The Presbyterian Church in Canada and the United Church of Canada are also members of this western section. These nine constituent members of the alliance in 1952 had approximately 20,000 churches with a communicant membership of more than 5,300,000.

In the interest of united action, the Presbyterian Church in the U.S., the United Presbyterian Church and the Presbyterian Church in the U.S.A. united their programs in evangelism, stewardship, pulpit exchange and providing chaplains for the armed forces. Another step in a united program developed in the formation of a committee, consisting of members from the Presbyterian Church in the U.S.A., the Presbyterian Church in the U.S., United Presbyterian Church, Reformed Church in America and Associate Reformed Presbyterian Church, to prepare a joint hymnal. The Presbyterian Church in Canada indicated its intention to join in this hymnal project. In May 1952 representatives of the Congregational Christian Churches and the Evangelical and Reformed Church resumed negotiations for merger after a court order in 1950 blocked the proposed merger.

In a wider co-operative program, five Presbyterian and Reformed churches, the Evangelical and Reformed Church, Reformed Church in America, United Presbyterian Church of North America, Presbyterian Church in the U.S. and Presbyterian Church in the U.S.A., joined with 24 other denominations in the National Council of Churches of Christ in the United States of America "in a common Christian witness and a co-ordinated program for a combined impact upon the national life." At the beginning of its second year the combined denominations had 144,000 congregations with a communicant membership of 33,000,000.

Special emphasis was placed on evangelism and missionary endeavour. The urgency "to restore the Bible to its rightful place in the preaching, teaching, and fellowship of the Church, and in the life of the family and of the individual believer" key-noted these unified endeavours. The formation of new communities had confronted the various denominations with the problem of establishing new churches without overlapping and through evangelism of bringing the unchurched to a sense of

their responsibility to God. Both the Reformed and Presbyterian churches through organized missions took steps to cope with this problem. Campaigns for building funds were instituted. The 150th anniversary year of the Board of National Missions of the Presbyterian Church in the U.S.A. provided the occasion for a building funds campaign for \$12,000,000 to build churches in these new communities. More than \$6,625,000 had been pledged by the end of May. The Presbyterian Church in the U.S. reported that 57 new churches had been organized during the period of 1951-52 and that in five years of the Program of Progress 263 churches had been established.

Europe.—The eastern section of the alliance, with headquarters in Geneva, Switz., reported the extension of its work in Europe, the British Isles, Australasia and Asia and that the young Presbyterian and Reformed churches in Africa and Latin America had shown a vital interest in the purpose of the alliance. (See also CHURCH MEMBERSHIP.) (G. S. K.)

President's Materials Policy Commission: see MATERIALS POLICY COMMISSION.

Presidents, Sovereigns and Rulers. The following list includes the names of those holding chief positions in their countries as of Oct. 1, 1952:

Country	Name and Office	Accession
Afghanistan . . .	Mohammed Zahir Shah, King	1933
	Shah Mahmud, Prime Minister	1946
Albania	Omer Nishani, Chairman of the Presidium of the People's Assembly	1946
	Gen. Enver Hoxha, Prime Minister	1944
Arabia, Saudi . .	'Abd-al-'Aziz ibn 'Abd-al-Rahman ibn Faisal ibn Sa'ud, King	1927
Argentina . . .	Gen. Juan Domingo Perón, President	1946
Australia . . .	Sir William John McKell, Governor General	1947
	Robert Gordon Menzies, Prime Minister	1949
Austria	Theodor Koerner, President	1951
	Leopold Figl, Chancellor	1945
Bahrein	Sir Sulman ibn Hamad al Khalifah, Sheikh	1942
Belgium	Baudouin I, King	1951
	Jean Van Houtte, Prime Minister	1952
Bolivia	Victor Paz Estenssoro, President	1952
Brazil	Getúlio Dornelles Vargas, President	1951
Bulgaria	Georgi Damjanov, Chairman of the Presidium	1950
	Vulko Chervenkov, Premier	1950
Burma	Ba U, President of the Union of Burma	1952
	U Nu (formerly Thakin Nu), Prime Minister	1948
Canada	Vincent Massey, Governor General	1952
	Louis Stephen St. Laurent, Prime Minister	1948
Ceylon, Dom. of	Lord Soulbury, Governor General	1949
	Dudley Senanayake, Prime Minister	1952
Chile	Gabriel González Videla, President	1946
China	Chiang Kai-shek, President of the National Government	1943
	Gen. Chen Cheng, Premier	1950
China, People's Republic of . .	Mao Tse-tung, Chairman of the Central People's Government of the People's Republic of China	1949
Colombia	Roberto Urdaneta Arbeláez, Acting President	1951
Costa Rica . . .	Otilio Ulate Blanco, President	1949
Cuba	Gen. Fulgencio Batista, Provisional President	1952
Czechoslovakia .	Klement Gottwald, President	1948
	Antonín Zápotocký, Prime Minister	1948
Denmark	Frederick IX, King	1947
	Erik Eriksen, Prime Minister	1950
Dominican Rep.	Gen. Hector Trujillo y Molina, President	1952
Ecuador	José María Velasco Ibarra, President	1952
Egypt	Ahmed Fuad II, King	1952
	Mohammed Naguib, Prime Minister	1952
Ethiopia	Haile Selassie I, Emperor	1930
	Bitwoded Makonnen Endalkatchou, Prime Minister	1944
Finland	Juho K. Paasikivi, President	1946
	Urho K. Kekkonen, Prime Minister	1950
France	Vincent Auriol, President of the Fourth Republic	1947
	Antoine Pinay, President of the Council of Ministers (Premier)	1952
Germany (East)		
German Democratic Rep. . .	Wilhelm Pieck, President	1949
	Otto Grotewohl, Minister-President (Premier)	1949
(West) Federal Rep. of Germany . . .		
	Theodor Heuss, President	1949
	Konrad Adenauer, Chancellor	1949
Great Britain . .	Elizabeth II, Queen	1952
	Winston Churchill, Prime Minister	1951
Greece	Paul I, King	1947
	Nicholas Plastiras, Prime Minister	1951
Guatemala . . .	Lieut. Col. Jacobo Arbenz Guzmán, President	1951
Haiti	Paul E. Magloire, President	1950
Honduras	Juan Manuel Gálvez, President	1949
Hungary	Istvan Dobi, Chairman of the Presidium of the National Assembly	1952
	Matyas Rakosi, Prime Minister	1952
Iceland	Ásgeir Árgreissson, President	1952
	Steingrímur Steinthorsson, Prime Minister	1950
India, Rep. of . .	Rajendra Prasad, President	1950
	Jawaharlal Nehru, Prime Minister	1947

Country	Name and Office	Accession
Indochina		
Cambodia . . .	Norodom Sihanouk, King	1941
Laos	Sisavang Vong, King	1945
Vietnam . . .	Bao Dai, Chief of State	1949
Vietnam Democratic Rep.	Ho Chi Minh, (Communist) President	1945
Indonesia . . .	Achmed Sukarno, President	1949
	Wilopo, Prime Minister	1952
Iran	Mohammed Riza Pahlavi, Shahanshah	1941
	Mohammed Mossadegh, Prime Minister	1951
Iraq	Feisal II, King	1939
	Abdul-Ilah, Prince Regent	1939
	Mustafa el-Umari, Prime Minister	1952
Ireland, Rep. of . . .	Sean T. O'Kelly, President	1945
	Eamon de Valera, Prime Minister	1951
Israel	Chaim Weizmann, President	1948
	David Ben-Gurion, Prime Minister	1948
Italy	Luigi Einaudi, President	1948
	Alcide de Gasperi, Prime Minister	1946
Japan	Hirohito, Emperor	1926
	Shigeru Yoshida, Premier	1948
Jordan	Hussein I, King	1952
	Tewfik Abu-Huda, Prime Minister	1950
Korea (South) Rep. of Korea . . .	Syngman Rhee, President	1948
(North) Democratic People's Rep. of Korea . . .	Kim Il Sung, Premier	1948
Kuwait	Abdullah bin Salim al-Sabah, Sheikh	1950
Lebanon	Camille Shamun, President	1952
	Gen. Fuad Shenab, Prime Minister	1952
Liberia	William V. S. Tubman, President	1944
Libya	Idris I, King	1951
	Mahmud Muntasser, Prime Minister	1951
Liechtenstein . . .	Franz Josef II, Sovereign Prince	1938
	Alexander Frick, Prime Minister	1945
Luxembourg . . .	Charlotte, Grand Duchess	1919
	Pierre Dupong, Premier	1937
Mexico	Miguel Alemán, President	1946
Monaco	Rainier III, Prince	1949
Morocco	Sidi Mohammed ben Youssef III, Sultan	1927
	Gen. Augustin Guillaume, French Resident General	1951
Nepal	Tribhubana Bir Bikram Shah Deva, King	1911
Netherlands . . .	Juliana, Queen	1948
	Willem Drees, Prime Minister	1948
New Zealand, Dom. of . . .	Lieut. Gen. Sir Willoughby Norrie, Governor General	1952
	Sidney George Holland, Prime Minister	1949
Nicaragua	Gen. Anastasio Somoza, President	1950
Norway	Haakon VII, King	1905
	Oscar Torp, Prime Minister	1951
Oman (Muscat) . . .	Said bin Taimur, Sultan	1932
Pakistan	Ghulam Mohammed, Governor General	1951
	Khawaja Nazimuddin, Prime Minister	1951
Panamá	Col. José Antonio Remón, President	1952
Paraguay	Federico Chaves, President	1949
Peru	Gen. Manuel A. Odría, President	1950
Philippines, Rep. of the	Elpidio Quirino, President	1948
Poland	Boleslaw Bierut, Chairman of the Council of State	1947
	Josif Cyrankiewicz, Chairman of the Council of Ministers	1947
Portugal	Gen. Francisco Higinio Craveiro Lopes, President	1951
	Antonio de Oliveira Salazar, President, Council of Ministers (Prime Minister)	1932
Rumania	Petru Groza, Chairman of the Presidium of the Grand National Assembly	1952
	Gheorghe Gheorghiu-Dei, Prime Minister	1952
Salvador, El	Lieut. Col. Oscar Osorio, President	1950
South Africa . . .	Ernest George Jansen, Governor General	1951
	Daniel F. Malan, Prime Minister	1948
Spain	Gen. Francisco Franco, Chief of State (President of the Council of Ministers)	1938
Sudan	Sir Robert George Howe, Governor General	1947
Sweden	Gustav VI Adolf, King	1950
	Tage Erlander, Prime Minister	1946
Switzerland . . .	Karl Kobelt, President, Swiss Confederation	1952
Syria	Col. Fawzi Silo, Chief of State and Prime Minister	1951
	Col. Adib el Shishakly, Vice-Chief of State	1951
Thailand	Phumiphon Adundet, King	1946
	Field Marshal Luang Pibul Songgram, Prime Minister	1948
Tunisia	Sidi Mohammed el-Amin, Bey	1943
	Jean de Hautecloque, French Resident General	1951
Turkey	Celal Bayar, President	1950
	Adnan Menderes, Prime Minister	1950
Union of Soviet Socialist Republics . . .	Nikolai Mikhailovich Shvernik, Chairman of the Presidium of the Supreme Soviet	1946
	Joseph V. Stalin, Chairman of the Council of Ministers	1946
United States . . .	Harry S. Truman, President	1945
Uruguay	Andrés Martínez Trueba, Chairman of the Governing Council	1952
Vatican City . . .	Pius XII, Pope	1939
Venezuela	Germán Suárez Flámerich, President	1950
Yemen	Sayf al-Islam Ahmad ibn Yahya, King	1948
Yugoslavia	Ivan Ribar, President of the Presidium of the People's Assembly	1945
	Josip Brozovich or Broz (Tito), Premier	1944
Zanzibar	Khalifa bin Harub, Sultan	1911
	John Dalzell Rankine, British Resident	1952

dexes fluctuated narrowly, the maximum change from low to high points being less than 2% in each case. Nevertheless, the consumers' price index reached a new all-time high in Aug. 1952, about 1% above the level of the preceding December.

A substantial revision in the method of measuring wholesale price changes was introduced by the bureau of labour statistics in January. Prior to this time wholesale price movements were measured by comparing monthly the prices of about 900 items (classified into 10 groups and 50 subgroups) with their respective prices in the base year 1926. The new index compared monthly the prices of nearly 2,000 commodities (classified into 15 groups and 88 subgroups) with their respective average prices during the three-year period 1947 through 1949. Average sales in 1947 were used to determine the relative importance of each commodity in the new index.

Table I.—Per Cent Increase in Wholesale Prices, by Major Commodity Groups, United States, Prewar Prices to Postwar High Points*

Commodity group	High post-World War II increase from Aug. 1939	High post-World War I increase from July 1914
All commodities	(March 1951) 145	148
Farm products	(March 1951) 234	138
Foods	(Aug. 1948) 182	137
Textile products	(March 1951) 170	252
Fuel and lighting materials	(Dec. 1951) 92	277
Metals and metal products	(Dec. 1951) 106	99
Building materials	(March 1951) 155	218
Hides and leather products	(Feb. 1951) 157	192
Chemicals and allied products	(April 1951) 99	123
Housefurnishings	(April 1951) 110	164
Miscellaneous	(Feb. 1951) 95	102

*The high points following World War II are computed through Dec., 1951 from the official wholesale price index (1926 = 100) applicable during that period. The official wholesale price index beginning in Jan. 1952 (1947-49 = 100) is not directly comparable with the old index. However, through Sept. 1952, only metal and metal products appear to have reached a new high, and that in the month of September.

Source: Computed from data published by the Bureau of Labor Statistics of the U.S. Department of Labor. Except as otherwise indicated, all computations presented in this article are based on such data.

Wholesale prices for each major group of commodities in the old index shown in Table I, except for foods, had attained their post-World War II highs in various months during 1951, and foods virtually reached the Aug. 1948 level in Oct. 1951. In general, the indexes for the major groups of wholesale commodities were slightly below their peaks during 1952 with the exception of metals and metal products which reached a new high in September.

However, prices of machinery and motive products reached a new high in February as did prices of tobacco and beverages, while those of nonmetallic minerals reached a maximum in June; none of these major groups was included as such in the old index.

Retail prices, as reflected by the cost-of-living index of the bureau of labour statistics, attained a postwar peak in August.

WHOLESALE AND CONSUMERS' PRICES in the United States, Oct. 1951-Oct. 1952 (Jan. 1952=100) (Source: U.S. Department of Labor, Bureau of Labor Statistics)

Prices. In the United States, both wholesale and retail prices remained relatively stable throughout the year 1952. This general stability of prices reflected both the effectiveness of the anti-inflationary program and, more particularly, the high level of productivity of the economy. Despite continued inflationary potentials, the wholesale and consumers' price in-

The only components of the index which did not reach new highs during the year were apparel and housefurnishings.

As shown in Table II, retail prices increased 94% from Aug. 1939 to Aug. 1952. This inflation in consumers' prices reduced the purchasing power of the dollar by nearly one-half from the beginning of World War II. The increases in prices were particularly notable in foods (152%), housefurnishings (111%) and apparel (108%), all of which led the index upward. Although consumers' prices remained relatively stable in 1952, the immediate increases in these prices following the outbreak of war in Korea in 1950 were not offset by any subsequent price deflation, and consumers' prices were 12% higher than they had been at the outbreak of the Korean conflict. The greatest increases were in food (a sizable item in the budget of the moderate-income family for which the cost-of-living index is computed), housefurnishings and apparel.

Table II.—Per Cent Increase in Cost of Living (Consumers' Retail Prices), by Major Items, United States, Prewar Prices to High Points

Item	High post-World War II increase from Aug. 1939	Highest increase from June 1950
All items	(Aug. 1952) 93.8	12.3
Food	(Aug. 1952) 151.9	16.0
Apparel	(Sept. 1951) 108.4	13.2
Rent	(Oct. 1952) 37.1	9.2
Fuel, electricity, etc.	(Oct. 1952) 52.2	6.7
Housefurnishings	(May 1951) 111.3	15.0
Miscellaneous	(Sept. 1952) 73.7	12.8

Wholesale prices declined slightly each month from January through June, rose slightly in the early summer and then fell once again in September. As shown in Table III, prices of all but two major groups of commodities showed only minor variations. The exceptions were the prices of hides and leather products, which fell abruptly in the spring before stabilizing, and those of rubber and rubber products, which fell rapidly each month through September. The relatively small decrease in the index of all commodity prices was insignificant when compared with the inflation in such prices which had occurred following the outbreak of World War II in Sept. 1939. In January, at their highest level of the year, wholesale prices were 132% above the level of Aug. 1939, 86% above the level prevailing at the time of Pearl Harbor, 54% greater than at the termination of price controls in June 1946, 13% above those prices prevailing at the outbreak of the Korean conflict and 1.7% below the level of prices in Jan. 1951 when price controls were imposed.

Comparisons of consumers' prices toward the end of the year with prices prevailing at significant earlier dates are indicated in Table IV. Prices in September were 94% above the prices prevailing in Aug. 1939, 73% greater than in Dec. 1941, 43% above those prevailing at the time of price decontrol in June 1946, 12% above the level at the outbreak of war in Korea and 5% above those prevailing at the time price controls were introduced in Jan. 1951.

Monthly changes in the various components of the cost-of-living index are shown in Table V. Rents and miscellaneous prices moved steadily upward; clothing and housefurnishings prices

Table IV.—Per Cent Change in Consumers' Prices (Cost of Living) by Major Commodity Groups, United States, Selected Periods, 1939-52

Commodity	Post-war high	Per cent change Sept. 1952 from					
		Jan. 1951	June 1950	June 1946	Dec. 1941	Aug. 1939	Dec. 1951 from Dec. 1950
Food	—1.0	5.1	14.8	60.2	106.2	149.4	7.4
Apparel	—3.2	1.9	9.6	28.7	76.2	101.7	5.8
Rent	0.0	6.9	8.8	31.2	31.6	36.5	4.7
Fuel, electricity and ice	0.0	3.0	6.1	33.6	41.8	51.4	1.5
Housefurnishings	—3.6	—1.2	10.9	31.3	75.5	103.8	3.4

All items	—0.2	5.1	12.1	43.1	72.7	93.5	5.8

moved steadily downward; and food price movements paralleled those of the index of all commodities. The fluctuations from month to month in each component group were noticeably small.

Table V.—Consumers' Price Index (Cost of Living), by Major Commodity Groups, United States

Year and month	Per cent change Sept. 1952 from						
	Jan. 1952=100	All items	Food	Apparel	Rent	Fuel, electricity and ice	House-furnishings and miscellaneous

October	101.0	100.0	98.8	102.4	102.3	97.8	102.8

In the chart on page 579 monthly changes in the wholesale and retail price indexes are indicated.

The tendency toward balance between supply and demand which had been evidenced late in 1951 by the stability of wholesale prices continued throughout 1952. The continued rise in consumers' prices in 1951 also came to a halt at the beginning of the year. The comprehensive system of anti-inflationary controls inaugurated during 1951 were partially responsible for stabilization. Prices continued to be controlled by the Office of Price Stabilization which imposed ceilings on most products. Some upward revisions in price ceilings were made during the year to eliminate inequities in the price structure and to compensate businesses for increased wage costs when upward adjustments of wage rates were granted by the Wage Stabilization board. The latter attempted to eliminate wage inequities by permitting wage increases to compensate for increases in the cost of living and for improvements in productivity.

However, many commodities sold at prices below price ceilings, and ceilings were removed from some commodities, notably men's apparel, at the end of the summer. Credit restrictions on the purchase of consumers' durable goods were removed and those on housing were modified during the year, although banks and other lending institutions continued voluntarily to restrain the extension of credit. These tendencies toward modification and elimination of controls largely reflected the very high level

Table III.—Wholesale Price Index, by Major Commodity Groups, United States

(Jan. 1952=100)

Year and month	All commodities	Form products	Processed foods	Textile products and apparel	Hides, skins and leather products	Fuel, power and light	Chemicals	Rubber and rubber products	Lumber and wood products	Pulp and paper products	Metals and metal products	Machinery and motive products	Furniture and household durables	Nonmetallic minerals	Tobacco beverages	Miscellaneous

of production in the economy. Despite the continued high rates of spending by individuals, businesses and government, inflationary competition for commodities was either controlled or absent.

During the year the national output, national income, personal savings and personal expenditures all appeared likely to attain new record levels. Increased governmental expenditures for the prosecution of the war in Korea, for the defense mobilization program and for the Mutual Aid program while the nation maintained at least the same level of civilian consumption at home provided ample testimony of the efficiency of production and the effectiveness of the direct and indirect anti-inflationary measures which had permitted these accomplishments with but moderate changes in prices. (W. V. Wi.)

Great Britain.—Commodity Prices.—Textile materials were firm in price at the end of 1951 after the collapse from the inflated figures recorded early in that year. There were price falls combined with considerable fluctuation in the early part of 1952, followed by more variable movements. Wool prices improved around midyear; since there was no accumulation of stocks in the hands of producers and manufacturers, and since there was a substantial balance between world consumption and production, any recovery in consumption had a direct effect on prices. Cotton prices were high in the winter of 1951–52, partly because of low estimates of the U.S. crop, and the reduced demand for cotton goods led to a fall which was not halted until after mid-1952. There were particularly large reductions in prices of sisal and jute in the middle months of 1952, though the prospects then improved. Late in the year, prices of textile materials were still generally at or below the levels ruling before the Korean war.

The long and almost continuous rise in prices of nonferrous metals (except tin) was halted early in 1952. Rearmament demands were largely concentrated on copper which remained scarce and firm in price. Supplies of lead and zinc were more than adequate and both prices were reduced rapidly. Controls over the uses of zinc, in force since Dec. 1950, were ended in Aug. 1952 and private trading in lead was resumed in October.

After a low point late in 1951, the price of tin recovered early in 1952 on the conclusion of a materials agreement between the U.K. and U.S. governments. Subsequent fluctuations were around a steady level of about £970 per ton, compared with £600 per ton before the start of the war in Korea. Rubber prices, which reached highly inflated figures early in 1951, declined with only minor oscillations until in Sept. 1952 they fell to the level, around 2s. per pound, ruling before the Korean war. The main influences were U.S. policy on stock-piling and on synthetic production, expansion of output in Indonesia and a potential excess of world supply over demand.

Prices of commodities produced within the sterling area, particularly rubber, cocoa and jute, were both declining and fluctuating in 1952 to a greater extent than other commodities purchased by the sterling area from the rest of the world. This was a contributing factor in the 1952 crisis in the balance of payments of the area.

Import and Export Prices.—The prices paid by the U.K. for deliveries of imported produce were still high early in 1952 but then declined during the year. Imported raw materials fell in price first, followed later in the year by prices of imported foodstuffs and manufactures. The level of prices of U.K. exports, though well above that of 1951, remained generally stable during 1952. The weakness of textile prices was almost offset by firm prices of exports of the metal-using and engineering industries. The improvement in the terms of trade during 1952 was, therefore, the result of lower import prices rather than higher prices of exports.

Wholesale and Retail Prices.—Materials used by the manufacturing industry in general fell by nearly 20% from the peak of March 1951 to the beginning of 1952 and then by a further 10% in the first half of 1952. There was greater stability in the middle of the year, but the decline in commodity prices had not then worked itself out and there were further falls in wholesale prices of materials later in the year. Cuts in food subsidies, and consequent increases in food prices, were announced in the budget of March 1952, but they were spread over a period of several months. The rise in food prices, both at wholesale and at retail levels, was more than 10% during 1952. On the other hand, prices of clothing and household furnishings were marked down, particularly around midyear, in response to slack demand and accumulated stocks. Other wholesale and retail prices, particularly of goods produced by the metal-using industries, were generally somewhat higher in 1952.

The increase in the all-items index of retail prices during 1952 was mainly the result of higher food prices; it was at a slower pace, compared with the rapid rise in 1951. There was some seasonal decline in the late summer before the upward movement was resumed. The increase in wage rates, though not in earnings, continued to be rather less than that in retail prices.

European and Commonwealth Countries.—In most European countries dependent on imports the domestic price level was influenced directly and indirectly by the decline in world commodity prices in 1952. In addition there were several countries which adopted vigorous deflationary policies with some success. In the Netherlands, for example, wholesale prices rose rapidly until the second quarter of 1951 but a year later they were 5% lower and falling. In Norway and Sweden, however, the rise in wholesale prices continued into 1952. By the middle of 1952 wholesale prices in countries little affected by devaluation (Switzerland and Italy in particular) were at much the same levels as in 1948 and somewhat above the mid-1950 figures. In most other countries, under the influence of devaluation and rearmament, wholesale prices had settled at 40% to 50% higher than in 1948.

In Australia, New Zealand and the Union of South Africa, the course of domestic prices was dominated by prices of imported manufactures rather than those of basic commodities. Inflationary pressures were particularly strong in Australia. In con-

trast, the measures of deflation introduced by India were very successful; wholesale prices fell by 20% in the year after May 1951 to a level about the same as in 1948. (R. G. D. A.)

Price Stabilization, Office of. The economic situation of the United States during 1952 was characterized by continued inflationary pressures in many industrial areas connected with the defense program (e.g., metals, machinery and certain chemicals) as well as in many segments of the food industry. During the summer, the cost of living reached new all-time peaks when increases in food, transportation, medical care and rent offset some decreases in apparel and house furnishings.

These developments together with (1) the increasing share of industrial capacity and man power devoted to defense, (2) the deficit position of the national budget, and (3) the uncertain international economy were cited frequently as illustrating the need for continued price controls. On the other hand, price relationships in the economy late in 1952 were again at approximately their pre-Korean war balance although at a 12% higher level. Prices of many nondefense items were softer than they had been for several months. Therefore, the activities of the Office of Price Stabilization centred mainly around development and refinement of standards and techniques to afford price relief where desirable and to remove price controls where absence of price pressures rendered such action appropriate.

In June 1952 congress, assuming a decreasing need for direct controls, extended the Defense Production act, Titles IV and VII of which constitute the statutory authority for price control, only until April 30, 1953. At the same time congress further curtailed the powers, scope and budget of the agency.

Meanwhile, OPS had developed and refined four standards for price relief based, respectively, on industry earnings, defense essentiality, product or product line and individual seller. Applicants had the greatest recourse to the industry earnings standard. This standard permitted increases in ceiling prices to enable each industry to earn at least 85% of its average earnings in the best three of the four years 1946-49, adjusted for net worth increase since then.

These standards, formulated to meet the legal requirement that price ceilings be "generally fair and equitable," were breached in mid-1952 as a result of a decision by the Office of

Defense Mobilization that defense production required steel price increases in excess of the standards regardless of their effect on price stabilization. Price increases thus granted on steel and on imported copper (necessary to maintain the Chilean supply) and aluminum (the last under the OPS essentiality standard) were allowed to be passed through by subsequent fabricators of these metals.

Despite the fact that food, for which average U.S. families spend more than one-third of their budgets, continued to rise during the year, legal authority for food price control was further reduced in June 1952. This was accomplished by congressional exemption of fresh and processed fruits and vegetables and further limitations on meat slaughter control, in addition to continuation of parity and other legal minimum price requirements. However, in October, OPS began large-scale community pricing of dry grocery products and required posting of dollar-and-cent ceiling prices in all retail food outlets in many marketing areas.

In April 1952 OPS began to suspend price controls on commodities selling substantially below ceilings. By October the suspended list included raw cotton, wool and synthetic fibres, their yarns, fabrics and staple household products; hides, leather and shoes; burlap; certain fats and vegetable oils; bulk and bottled whiskeys, wines and spirits; sofa beds and bedding, and cotton linter upholstery material; radio, phonograph and television sets; and soft surface floor coverings. Provision was made for reinstituting controls if inflationary pressure developed.

In Feb. 1952 Ellis G. Arnall succeeded Michael V. DiSalle as director of price stabilization, and, in September, Arnall was succeeded by Tighe E. Woods. (T. E. Ws.)

Priest, Ivy Maude Baker (1905—), United States government official, was born on Sept. 7 in Kimberley, Utah. After her graduation from high school in Bingham Canyon, Utah, she took courses at the University of Utah, and later was employed as a telephone operator and in various department stores. She also taught evening classes in American history and citizenship. She and her husband, Roy F. Priest, whom she married in 1935, have three children.

Her work in party politics began with the Young Republican organization in 1932. She was president of the Utah State Young Republican organization (1934-36), director of the Young Republican Western States organization (1936-40), president of the Utah State Women's Legislative council (1937-39), and became a member of the Republican national committee for Utah in 1944. In Sept. 1950 she became the national committeewoman of the Republican party. She succeeded Mrs. Gilford Mayes as assistant in charge of the women's division of the Republican national committee on Aug. 15, 1952.

On Nov. 25 she was selected by President-elect Dwight D. Eisenhower to serve as treasurer of the U.S.

Primary Education: see EDUCATION.

Prince Edward Island. Smallest province of Canada, 2,184 sq.mi., Prince Edward Island lies in the Gulf of St. Lawrence. Pop.: (1951) 98,429. Capital: Charlottetown, pop. (1951) 15,689.

History.—No major new legislation was considered by the legislature which met on March 11, 1952. A committee of the legislature was set up to consider electoral reform (i.e., whether representation by both councillors and assemblymen should be continued) but by Oct. 31 the committee had not made public its report. Total provincial production from all sources for the

fiscal year ending March 31, 1952, totalled \$65,000,000.

Finance.—There was a provincial surplus of \$219,724 on ordinary account at the year ending March 31, 1951, on current revenue amounting to \$7,000,000. Capital expenditures were \$2,400,000 for the year, with an increase in over-all liabilities of \$1,300,000.

Agriculture.—Total agricultural production for 1951 was worth \$26,800,000, or \$5,000,000 greater than in 1950. There were record returns of potatoes, which rose in price to as much as \$5 per bushel. The 6,000,000 bu. harvested from 31,000 ac. resulted in an export of 6,000 carloads which returned \$15,000,000. The government-approved hatcheries hatched and sold a record high of 873,517 chicks in 1951, which was 52% more than in 1950. Butter production in 1951 was 5,000,000 lb., cheese production 877,000 lb.

Fisheries.—The total value of the catch in 1951 was \$3,212,629, of which lobsters accounted for \$2,227,234. The total weight of the 1951 harvest was 33,000,000 lb. The lobster catch weighed 8,342,000 lb., herring 6,250,000 lb., cod 4,400,000 lb., hake 2,500,000 lb., mackerel 1,500,000 lb. The 1951 oyster crop fell off by 50% compared with the 1950 crop.

Forestry.—The output of sawn lumber was 25% higher in 1951 than in 1950. There were 83 mills in operation producing 11,000,000 bd.ft. worth \$632,000, compared with 85 mills producing 9,800,000 bd.ft. valued at \$506,000 in 1950. Returns from island-grown pulpwood amounted to \$2,000,000 in 1951.

Industry.—The 1951 index of employment stood at 176.8, and in July 1952 it reached 196.5 (1939=100). Average weekly earnings in 1939 were \$19.79, compared with \$37.52 for 1951 and \$40.32 for July 1952. (C. Cy.)

Principe: see PORTUGUESE OVERSEAS TERRITORIES.

Printing. The most important developments in the graphic arts in the United States during 1952 were directed at making it possible to achieve faster production in greater volume to reduce manufacturing costs. High-quality colour printing at a fraction of the usual cost was claimed to be possible with a new system of offset lithography developed at the research laboratories of the Eastman Kodak company, Rochester, N.Y. It was believed that the colour printing system, designed especially for short press runs of from 1,000 to 5,000 copies, might bring full-colour illustrations into many publications in scientific, medical and similar fields where colour had formerly been ruled out by high costs. The process departs from conventional offset colour printing methods in a number of ways: (1) printing is done in three colours with special inks; (2) the process is based upon the use of 35-mm. Kodachrome slides; (3) colour correction is achieved photographically without handwork; (4) printing is done with 266-line halftones, while commercial printing is done largely with 120- or 133-line halftones; (5) most of the colour illustrations are printed on a simplified small offset press but the techniques may be applied to larger press operation; (6) printing is done with an aluminum support grainless cellulose acetate plate; (7) all registration with exception of a final small adjustment on the press is achieved automatically by purely mechanical means.

During the year, the minor revolution in what is called "automatic typesetting" in graphic arts publication work continued by installation of Teletypesetter equipment (Teletypesetter corporation, Chicago, Ill.) in daily newspapers and a number of weekly news magazines. Coincidental with this movement, the remote transmission of press association news matter (the Associated Press, New York, N.Y.) from a central sending point to publishing plants was greatly accelerated. This development occurred mostly among medium-size daily newspapers. The service is virtually automatic with respect to Teletypesetter tape punching at the receiving point. National news is transmitted from a single sending source via wire to receiving evening and morning newspapers. For evening papers, transmission is between 1 A.M. and 8 A.M. Sending hours for morning newspapers are adjusted accordingly. All newspapers receiving the service have standardized column width of 12 picas with line-casting machine matrices punched on the unit system for universal justification. A printed monitor copy is transmitted to each paper simultaneously for editing purposes. After the edited tape has been spliced, it is placed in the line-casting machine keyboard

operating unit for automatic operation of the machine to produce the slugs. With automatic operation of the high-speed machines (from 9 to 12 lines per minute), it is possible to cast an average of 375 slug lines per hour throughout the working day.

Development of a lightweight laminated curved plate for letterpress magazine printing was announced by Time, Inc.'s research laboratories at Springdale, Conn. The laminated plate consists of an aluminum backup, or saddle, to which the electrotype is bonded with a thermosetting adhesive. The plate is approximately two and one-half times lighter than the conventional lead-backed electrotype. Breakage of plates on the press is eliminated as a result of the reduction of the effect of centrifugal force in the high-speed rotary printing operation plus the new manner of holding the plates on the press cylinder under tension by means of movable clips which engage slots milled into the underside of the plate. Also demonstrated was the new Lithure bimetal offset printing plate which consists of a sheet of chrome-plated copper. In processing, the platemaker etches through the chrome to bare the copper printing surface. It is the copper that prints the image. In principle, this is an intaglio printing plate, the copper being grease (ink) receptive but moisture repellent while the chrome nonprinting areas are water receptive but grease repellent.

A bimetal photoengraving plate was developed and put into daily use. The plate itself consists of magnesium with an electrolytically deposited zinc coating 0.0005 in. thick, the total thickness of the plate being the same as standard 16-gauge stock (0.065 in.). The purpose in developing the plate is to permit handling of the magnesium plate during the etching operation in a manner similar to zinc. Savings in plate production time range from 30% to 50%. Mechanical routing of line plates is eliminated because of the etching depth of 0.040 in. An 85-line halftone screen may be used with faithful reproduction through the stereotype plate. It was claimed that type matter reproduces excellently because of clean etching properties of the magnesium plate. (M. St.)

Prisoners of War. Throughout 1952 prisoners of war were the crux in armistice debates in Korea: the Chinese and North Korean Communists insisting that, fol-

HAULING COMMUNIST BANNERS out of a P.O.W. compound on the island of Koje. U.N. troops and tanks were sent into four of the compounds, June 4-5, 1952, to end the virtual rebellion which reigned after prison commander Gen. Francis T. Dodd was seized and held hostage for 78 hr. in May

lowing an armistice, all prisoners of war should be repatriated, regardless of their individual wishes, and the United Nations command refusing to admit of compulsory repatriation; the U.N. command proposed that the International Committee of the Red Cross interview each prisoner with regard to his choice.

This proposal having been rejected by the Communists, the U.N. command proceeded to conduct an inquiry of its own in the prison camps with the resulting announcement that of the 132,000 prisoners held by the U.N. command, all but approximately 70,000 would forcibly resist return to Communist control.

This announcement brought to a head a series of conflicts in the camps between Communists and non-Communists and between the prisoners and their guards, culminating on May 7 in the forcible seizure by Communist prisoners of Brig. Gen. Francis T. Dodd, United Nations commander of Kojé Island prison camps.

After General Dodd's release was obtained, U.N. command authorities proceeded to break up the larger camps and compounds and to separate Communist and non-Communist prisoners. In effecting this, over resistance by the Communists, and in subsequent revolts, more than 100 prisoners and guards were killed.

The International Committee of the Red Cross continued its camp inspections in South Korea but was not permitted entry into North Korea, despite appeals to the North Korean government by the 18th International Red Cross conference meeting in Toronto, Can., July 26-August 7. No additional names of prisoners held by the North Koreans were received by the I.C.R.C. during 1952.

The *ad hoc* Commission on Prisoners of War established by the United Nations general assembly on Dec. 14, 1950, to facilitate the repatriation of prisoners captured during World War II, held its first session in Geneva, Switz., in Jan. 1952. Prior to this meeting, the U.S. government informed the Soviet government of its intention to participate and urged the Soviet government to do likewise; the Soviet government refused.

During the meetings of the commission in Geneva, it received evidence from the governments of Japan, western Germany and Italy that more than 1,000,000 nationals of those countries were still missing in the Soviet Union and China. Its appeals to the Soviet and Chinese governments for information concerning these missing persons went without response and at a second session of the commission in Geneva, August-September, Justice J. G. Guerrero (El Salvador), chairman, was forced to conclude that without the co-operation of the Soviet and Chinese governments, the work of the commission was paralyzed. (See also RED CROSS.)

(H. W. DG.)

Prisons. During the year 1952 public interest in prisons was focused chiefly on the series of riots and disturbances which took place in several state prisons and reformatories. Within a period of four months, between April and July, 12 prisons in eight states of the United States and in Canada were the scenes of serious and costly uprisings. Of these, the two most serious disturbances occurred in the New Jersey state prison at Trenton, one of the oldest prisons in the country, and in the State Prison of Southern Michigan at Jackson, the largest prison in the country. Although the immediate conditions which precipitated each of these incidents varied widely, they did serve to arouse some public concern regarding the many basic inadequacies of prison programs and plants throughout the country. Among the many problems which state prison administrators had to cope with were the sharply increasing costs of detention, inadequate and poorly trained personnel, a lack of professional services of various kinds, idleness and the absence of constructive employment for prisoners, and old, obsolete physical plants.

STATE TROOPERS holding prisoners at bay during a riot in the State Prison of Southern Michigan at Jackson, in April 1952.

Of the state prisons, 23 were from 70 to more than 100 years old and only 17 were less than 50 years old.

At the close of 1952 there were in the United States 152 state correctional institutions for adults which included 68 prisons or penitentiaries, 26 reformatories for men, 25 reformatories for women, 22 farm institutions, 11 special institutions including 3 hospitals for the criminal insane and 4 institutions for defective delinquents. This number of state institutions was exclusive of the federal prison system, which comprised six penitentiaries, three reformatories for men and one for women, a medical centre, a detention facility, eight correctional institutions, three camps, a training school and a forestry camp for boys.

The prison population at the end of 1951 numbered 164,896 in state and federal prisons and reformatories. This represented a decrease of 2,277 from the number confined in these institutions at the end of 1950. Data on the prison population of the United States during the period 1940-51 as shown in the table indicated a trend toward handling the offender in the community and toward an increasing use of parole as a method of release. Paroles represented 36% of all releases in 1940 as compared with 45% in 1950.

Despite slow progress, some notable changes in prison systems in the United States had taken place. During the year, prison reform was an important public and political issue in Louisiana,

Year	Federal institutions	State institutions	Total	Rate per 100,000 population
1951	17,395	147,501	164,896	109.2
1950	17,069	150,104	167,173	110.9
1949	16,808	148,319	165,127	111.9
1948	16,307	140,847	157,154	108.3
1947	17,146	135,149	152,295	106.3
1946	17,622	123,620	141,242	102.1
1945	18,638	116,031	134,669	105.6
1944	18,139	115,930	134,069	105.9
1943	16,113	122,385	138,498	108.7
1942	16,623	136,080	152,703	116.7
1941	18,465	148,190	166,655	126.7
1940	19,260	155,971	175,231	133.1

*Figures represent sentenced prisoners in state and federal prisons and reformatories for adult offenders. Rates calculated on basis of estimated civilian population.

Delaware, Kentucky, Maryland, Minnesota and to a lesser extent in several other states. In Massachusetts the Charlestown prison, built in 1805, was replaced by a new institution, and in New Jersey legislation to provide a new institution to replace the Trenton prison built in 1836 was given considerable public support. (See also CRIME.)

Protestant Episcopal Church. According to statistics published in the *Living Church Annual, 1952*, this church started the year with 2,643,488 baptized members; 1,712,070 communicants; 6,805 clergy; 6,447 lay readers; 62,877 church school teachers with 543,167 pupils; 566 candidates for orders; and 1,210 postulants (those listed by the bishops as desiring ordination). During the previous year there had been 109,289 baptisms (19,341 of them adult), 88,727 confirmations, 30,426 marriages, and 54,316 burials. Ordinations to the diaconate had numbered 287; to the priesthood, 276.

The shortage of clergy originating in World War II was still being felt. Heavy enrolments in all seminaries and the recent organization of a new institution, the Episcopal Theological Seminary of the Southwest, at Austin, Tex., promised an eventual rectification of this condition.

The triennial general convention met in Boston, Mass., Sept. 6–19, 1952. Its most important act was to sanction the ordination of laymen as “perpetual” deacons, a departure from the Anglican tradition of retaining the diaconate as a preparatory grade in the professional ministry. The convention voted a record budget of \$5,929,042 for the following three years, and approved a conference of Anglicans from all over the world to meet in Minneapolis, Minn., in 1954. It rejected a proposal to substitute an investment trust for the existing church pension fund, which operated under the strict insurance laws of New York state.

The admission of women to the house of deputies, proposed at several recent general conventions, was again defeated. A resolution for the establishment of a permanent committee on

the interpretation of the canons, passed by the house of deputies, was rejected by the house of bishops.

The woman's auxiliary, meeting at the same time as the general convention, presented a record United Thank offering of \$2,400,000.

Representatives of the Protestant Episcopal Church participated in the third World Conference on Faith and Order in Lund, Swed., Aug. 15–28. (See also CHURCH MEMBERSHIP.)

Psychiatry. In child psychiatry the most striking advance in 1952 was the contribution to the understanding of human behaviour gained through the study of the child from infancy to the age of two years. At this preverbal level are seen many primitive and archaic patterns of thought previously observed in primitive man and in schizophrenics. This study increased the knowledge of childhood emotional problems, mental illness and the relation of both to the history of the race.

An outgrowth of this was the rapid development during the year of a psychotherapeutic technique for the treatment of schizophrenics, first instituted a few years earlier by Rosen. In this treatment an attempt is made to help the patient by communicating with him on his own level. In other words, the psychiatrist attempts to divine the true meaning behind the weird behaviour, the jumbled and bizarre speech and gestures, and to communicate to the patient in his own language such understanding, aid and comfort as is possible. The schizophrenic, in his regressive attempts at self-expression, makes liberal use of symbols, commonly used by primitive peoples and largely forgotten by civilized man.

Psychiatrists were viewing the progress of this technique with great interest. There were many failures to cure, and a few striking successes. It was still far too early properly to evaluate its place in the field of treatment.

In the realm of the so-called drastic therapies, the use of carbon dioxide inhalations for the treatment of neurotic manifestations was placed on a much firmer footing, and its indications and contraindications were better established. The treatment consists in allowing the patient to inhale CO₂ until the point of unconsciousness is reached. The administration is then stopped, following which consciousness is rapidly regained. This treatment is repeated three or four times weekly. For

STILLS from *Grief, a Peril in Infancy*, filmed by Dr. René A. Spitz to show the damage to a child's physical and mental health, even in a well-run foundling home, when the child had only “one-tenth of a mother.” Left: foundling during a three-month absence from its mother; right: after mother and child were reunited. The film was shown to psychiatrists and general physicians of the New York Academy of Medicine, New York city, in 1952

reasons not wholly understood, it seems to have a strongly beneficial effect in allaying anxiety. This not only makes the emotionally ill patient much more comfortable, but often enables him to compose himself sufficiently so that in talks with the psychiatrist he is able to come to a much better understanding of himself and a reasonably satisfactory solution of his problems. This treatment apparently achieved dramatic results with stutterers and persons suffering from allied speech defects. There again, however, the test of time was needed before the permanent place of CO₂ in psychiatric therapy could be properly fixed.

In the treatment of alcoholics, psychotherapy was still the method of choice. Antabuse as a method of treatment failed to live up to expectations, though it was still considered to have some limited usefulness. The biggest drawback was that most alcoholics reached a point at which their desire to drink was so strong that they refused to continue the medication. Toxic reactions frequently occurred, often of considerable severity. Psychotic episodes as a concomitant of Antabuse therapy had not been infrequent.

Cortisone and ACTH were used experimentally on the mentally ill. While it was known that they have varying effects on mental functioning, they were not particularly helpful in therapy. However, data were still being accumulated.

The investigations of certain psychoanalysts during the year, notably Otto Lowenstein and Mariann Kris, contributed greatly to the understanding of ego-psychology. By the use of the term "ego" is meant that functional part of the mind which is concerned with testing and dealing with reality. What is referred to as "common sense," for instance, is one of the functions of the ego. It was found that this begins to develop much earlier in childhood than was formerly suspected. It was hoped that the increase in understanding of the development and functions of the ego would lead to the more effective handling of such manifestations as criminal tendencies in adults, child delinquents, behaviour disorders and the like, which are all characterized by a generally uneven and insecure ego formation. (See also *PSYCHOLOGY*; *PSYCHOSOMATIC MEDICINE*.)

Psychology. Psychology in 1952 continued to advance in both its professional and scientific aspects. For professional psychology one of the most significant events in many years occurred when members of the American Psychological association, meeting in Washington, D.C., in September, adopted a code of ethics for psychologists. The principles covered the areas of public responsibility, relationships with clients, teaching, research, writing and publishing, and professional relationships, with primary emphasis throughout on the philosophy that the worth of a profession is determined by the value of its contribution to the welfare of man. The code was adopted for a three-year trial period after which its permanent acceptance would be voted on by all members of the association.

In his book *The Study of Instinct*, N. Tinbergen gave impetus to the current revival of interest in the study of innate behaviour. Describing the results of naturalistic observations as well as controlled experiments, he presented evidence for a process called the "innate releasing mechanism." This process is used to explain the fact that animals seem to react not just on the basis of what their sense organs can receive, but in terms of so-called sign stimuli. They respond primarily to limited aspects of their environments, and what is responded to depends upon the particular species of animal. For instance, a territory-holding male robin will attack a tuft of red feathers but not a

complete, mounted young robin with all the characteristics of a robin except the red breast. In other words, it is the red colour that seems to "release" the threatening behaviour. Many examples from other species were also given. Tinbergen emphasized the importance of doing research on the behaviour patterns of animals of many different species and of using objective methods to study them. He also maintained that the research techniques employed should be adapted to the species under observation, for the differences in behaviour are often so great that use of only a small number of standard techniques will not reveal the true range, complexity and potentialities of animal and human behaviour. Although more concerned with behaviour classified as innate, Tinbergen touched upon the modifications that may take place through learning, and argued that a thorough analysis of innate behaviour is necessary for an understanding of the process of learning. He also pointed out that detailed study of the similarities and differences of behaviour patterns among many species of animals may supplement the science of morphology and lead to a better understanding of the evolutionary process.

F. Ross Ashby's *Design for a Brain* contained the principles underlying the construction of the homeostat, an apparatus into which was built many of the characteristics of a nervous system. Ashby began his work with two fundamental premises: (1) that the essence of the nervous system is its adaptability and (2) that the nervous system can be explained mechanistically. He then proceeded to work out, deductively and mathematically, the properties of an adaptive system, and concluded that such a system must have a large number of variables acting as step-functions as well as many variables acting as part-functions. Moreover, the details of the system are arranged randomly so that they respond statistically, not individually. From these requirements resulted the basic principle upon which the machine was built—the principle of ultrastability. According to this principle, a system will maintain itself in a stable state, and when it is disturbed or disorganized, it will adjust its behaviour so as again to return to equilibrium. The homeostat can adapt itself to a variety of situations, readapt to changes in its own internal system, and shows certain activity that is very much like learning. It thus demonstrates the kind of adaptive behaviour which Ashby concluded is the essential characteristic of the nervous system. It also confirmed his hypothesis that the behaviour of the nervous system can be explained mechanistically and objectively.

There was continued interest in the role of motivation in learning and performance. Janet Taylor and K. W. Spence published the results of another of their studies on the effect of anxiety on learning. An earlier research had shown that anxious persons learned faster than nonanxious ones in a simple eyelid conditioning situation. However, further work showed that in a more complicated situation with many alternative ways of responding, the anxious subjects were inferior to the nonanxious. In a study of the effects of stress on performance, R. S. Lazarus and C. W. Eriksen found that when a group of college students was put under stress by being told that they had done poorly on an intelligence test, the variability of the group was much greater than that of a comparable group that was not under stress. The greater variability resulted from the fact that when under stress some students did much better and others much worse. In general, the students with high grade averages tended to get better scores when under stress, while the students with low academic standing decreased in performance and were more variable. D. J. Lewis was interested in studying the effects of partial reinforcement, or reward, on extinction. He had children play a game in which some of them were rewarded or "won" all the time, some were rewarded part of the time and

others were rewarded none of the time. He tested the children to see how soon the three groups would want to stop playing when they never won. He found that extinction—as measured by the time when the children decided to quit—was least in the children who had been rewarded part of the time when the game was first played, thus confirming the hypothesis that partial reinforcement results in greater resistance to extinction than either total lack of or complete reinforcement.

Jean Piaget's book *Play, Dreams and Imitation in Childhood* was a major contribution to the field of child psychology. Third in a series of books devoted to a careful analysis of the behaviour of three children from birth to early childhood, it described in detail how imitation changes from systematic to representative imitation. The book also covered children's play and how it develops, together with an analysis of the rules and structure of children's games, a critical discussion of various theories of play, and the role of unconscious symbolism in dreams and play.

The first in a series of reports on an extensive investigation of the processes and outcomes of psychotherapy was published by T. Gordon, D. L. Grummon, C. R. Rogers and J. Seeman. Limited to psychotherapy done by the client-centred method, the report gave the purpose and development of the research program, outlined the methodology and presented the findings on one complete case. In this research the clients were given personality tests before, during and after therapy. A control group, similar in as many respects as possible, which did not undergo therapy was also tested in order to learn whether personality changes attributed to therapy might be merely the result of the passage of time. The thorough presentation of the one case showed, among other results, that many important changes had taken place. On the Thematic Apperception test there was change in the direction of greater integration, self-confidence and admittance of aspects of experience to awareness. Emotional maturity, as rated by the client, friends of the client and the therapist, was increased. The perceived self of the client became more like the perceived self-ideal, more assured, uninhibited, self-directed and expressive. While admittedly incomplete and still in its early exploratory stages, the study was of significance in being one of the first to undertake the difficult task of analyzing the subtle and intricate processes that make up psychotherapy. (See also PSYCHIATRY; PSYCHOSOMATIC MEDICINE.)

Psychosomatic Medicine. Lincoln D. Clark, Walter Bauer and Stanley Cobb reported in 1952 a detailed study of ten patients with severe arthritis who presented evidence of a mental disorder in connection with the administration of cortisone and ACTH. In none was there a previous history of a major mental illness and no other drugs had been used to which a "toxic mental state" might be attributed. Moderately large doses of ACTH had been used prior to the onset of mental symptoms but there did not seem to be a correlation between the severity or the duration of the psychosis and the total or average daily dose of ACTH, nor was there any correlation between the rapidity or extent of the response to the drug and the occurrence of a psychotic complication. The investigators did not regard it as a form of toxic deli-

rium, nor were they able to draw any positive conclusions about the cause of the disturbance from their laboratory studies. Some of the early symptoms were insomnia, restlessness, delusional ideas and peculiar feelings in the front of the head sometimes followed by a frank psychosis. Fortunately, complete recovery occurred spontaneously in all cases.

Howard P. Rome and Francis J. Braceland found severe mental reactions in 10% of 100 patients treated with these drugs at the Mayo clinic, and Selwyn Brody, who studied eight patients at the Mt. Sinai hospital in New York, concluded that the variety of reactions to these drugs depended upon the personality of the patient. The drugs brought out the latent emotional responses of the individual. Most patients showed some initial euphoria but this gave way to various reactions in keeping with the individual personality structure.

Pseudocyesis, a condition in which a woman firmly believes herself to be pregnant and develops many of the symptoms of pregnancy, lends itself to an evaluation of the relation between the psyche and female sex-endocrine mechanisms. Robert R. Schopbach, P. H. Fried and A. E. Rakoff reported on 27 patients with this condition who presented themselves as pregnant with the usual symptoms. The most common symptom was a menstrual disturbance but breast changes with secretion occurred in 22. In 11 there was softening of the cervix and some enlargement of the uterus. In each case the pelvic examination was normal. Hormonal studies indicated changes that were thought to be the result of primary stimulation of the anterior pituitary by psychic factors.

It has been said that this syndrome does not occur in Negroes, but in the group reported they were greatly in the majority (23 to 4). All patients were considered neurotic, six to a severe degree. The basic psychologic mechanism appeared to be a conversion of anxiety arising from conflict between: (1) strong sexual drives plus the stress of present life situations in favour of pregnancy, and (2) early teaching, experiences and folklore which had negatively conditioned them in regard to reproduction. Superficial psychotherapy often produced a complete reversal but occasionally other therapies were combined to give objective "proof" of the nonpregnant state. Effective therapy relieved the syndrome so that there was a return to normal cyclic menses and hormonal pattern, and pregnancy occurred in four of eight previously infertile women. (See also EPIDEMICS AND PUBLIC HEALTH SERVICES; PSYCHIATRY.)

Public Assistance: see CHILD WELFARE; SOCIAL SECURITY.

Public Health Engineering. An outstanding development in 1952 was further progress leading toward the economical reclamation of fresh water from sea water by membrane and thermal processes. Extreme shortage of fresh water had long been a basic problem in many arid areas of the world. This had also become a primary concern in some semiarid areas as well, notably in southern California, because of the increasing demand on and exhaustion of ground water resources.

The basic chemistry of membrane behaviour had long been known, but the new information included the discovery of methods of preparing membranes of vastly improved quality, and the demonstration that with an applied electromotive force these

new membranes could be employed in the demineralization of brines. Wilfred E. Langelier hypothetically constructed a unit for the electrolytic demineralization of sea water by use of a series of alternate continuous flow chambers of raw sea water and manufactured fresh water, separated by resinous ion-selective membranes. The separating membranes were alternately cation-permeable and anion-permeable, so that each fresh-water chamber or cell was composed of a membrane of each type. He estimated an electric energy requirement of 30 kw.hr. per thousand gallons of fresh water produced, or approximately one-third that of the most efficient vapour compression distilling units which were being manufactured, and that capital charges, maintenance and other operating expenses would be materially less than for the competing distillation process.

Control of Arthropods and Arthropod-Borne Diseases.—

The resistance of flies and mosquitoes to DDT and other insecticides continued to increase and to extend to other arthropods of public health importance. Operational practices in control and the behaviour patterns of adult insects have great importance in resistance. Thus, residual house spraying for malaria control, directed against the few specimens of a zoophilic species of *Anopheles* which may rest in houses, seldom if ever causes significant resistance; more domesticated species may become resistant. At the other end of the scale, mosquito larvicidal measures for *Culex* and *Aedes* control, directed against total species populations, had caused great resistance against the chlorinated hydrocarbon insecticides, as in the States of California and Florida.

Globally, residual house spraying with chlorinated hydrocarbons was still the principal, effective method of malaria control, but it had lost most of its value against the house fly. Oriental sore, transmitted by sandflies, was added to the list of diseases controllable by DDT residual spray. A. Corradetti reported effective control in Italy at a cost of U.S. 25 cents per capita per year, achieved by spraying the insides of houses and stables.

Typhus in Korea was deleted from the list because of highly resistant body lice.

Fluoridation.—The water fluoridation movement continued its growth. According to F. J. Maier of the U.S. public health service, Australia, Canada, Costa Rica, England, the Netherlands, Japan, Panamá, Puerto Rico, Scotland and New Zealand had established or soon would have fluoridated public water supplies. In the U.S. the number of artificially fluoridated supplies had increased to 386 by the middle of the year, benefiting 7,500,000 people. This compared with 240 plants and 4,400,000 people at the start of 1952 and 78 plants and 1,400,000 people a year earlier. No harmful effects of any description were reported, and no industrial processes were adversely affected.

After seven years of controlled fluoridation at Grand Rapids, Mich., significant caries reductions had been observed in all age groups up to 16.

Water Analysis.—The German membrane filter for water analysis was not known in the U.S. until 1951. Rapid progress was made in 1952 in the large-scale production of these filters and in their technologic development. In bacteriologic analysis, these filters permit the concentration of small numbers of micro-organisms contained in large quantities of liquids, great reduction in the elapsed time of tests and in laboratory man-hours and facilities, and the separation of collected micro-organisms from inhibitory environments by simple manipulation. Presently developed molecular filter techniques permit the separation of an organism from its nutrient by removing the membrane from its nutrient pad and transferring it to another medium for differential identification and confirmation, as described by H. F.

Clark *et al.* and Alexander Goetz *et al.* Goetz also indicated certain advantages of the membrane filter in the physical analysis of water. (See also ACCIDENT PREVENTION; CHILD WELFARE; EPIDEMICS AND PUBLIC HEALTH SERVICES; INDUSTRIAL HEALTH; WORLD HEALTH ORGANIZATION.)

Public Relations. By 1952 it was evident that business, particularly big business, could agree to the following public relations principles (although it could not always or did not always care to practise them):

1. Every business organization (or any other social entity, for that matter) influences public opinion toward itself whether or not it is cognizant of doing so and whether or not it wishes to, simply by virtue of existing.

2. Since an organization does inevitably influence public opinion, it should do so constructively in the public interest, for in the long run business success and the public interest coincide.

3. Good public relations consists in meriting public support. To merit public support, a corporation must have a positive and progressive point of view. It must first do the right thing. Then it must continuously communicate and interpret knowledge of that accomplishment or intention to the interested or prospectively interested segments of the public with which it deals.

4. Public relations is an inescapable function of management and is as vital to business success as are engineering, production, sales or administration. Like these, it is an activity subject to planning and measurement.

There were during the year numerous and convincing evidences not only of these principles but also of the rise of public relations activity to professional status. Some of the significant ones may be cited.

A survey of the 312 companies in the U.S. which the American Institute of Management considered excellently managed showed that 74% had a policy-level executive in charge of public relations and that 73% had a separate department devoted to public relations. Only 38.8% of U.S. companies taken as a whole had separate public relations departments.

The survey, published in September, also disclosed that 20% of the 312 excellently managed companies employed outside public relations counsel on a year-round basis and that 17% used outside counsel on occasion.

The Public Relations Society of America reported that in five years its membership had increased from 600 to 1,400 and the 1,400 were public relations practitioners at the executive level, directing programs in 42 states and territories and 8 other countries; its chapters had increased from 6 to 24 and it had assisted in the formation of public relations associations in 9 other countries; its publication, *Public Relations Journal*, was read in every state and territory of the U.S. and in 22 other countries; a code of standards for professional practice had been developed and enforcement provisions added to the society's bylaws, with a national judicial council established and the

DISABLED U.S. veterans being trained to support themselves at a school for watch repair financed by the Bulova Watch company. This was an example of tax-exempt corporate philanthropy which was growing in 1952 as combining real benefits with good public relations values

society's 15 standing committees had pioneered new means to achieve greater professional competence.

One of the committees of the Public Relations Society of America, the commission on the social sciences, undertaking a five-year research program, had already been able to divulge some useful findings to the membership. Its chairman, Rex F. Harlow, interviewed 272 social scientists at 63 U.S. universities and contributed preliminary reports on such public relations guideposts as these:

"... facts alone are not always sufficient to win approval and desired action. The person to whom facts are presented must have a definite need for them, must be hospitable to them, before they are accepted and made use of by him. In studies made with movie audiences it was found that persons in attendance whose views were opposed to the facts simply rejected them. Others reconstructed them to fit their preconceived ideas. Only persons who were in agreement with the facts accepted them fully and willingly."

"... in supervision the 'team approach' has greater power and potentiality than the traditional 'man-to-man-approach.' That is, the total production of a properly-activated team can be made greater than the total combined production of a comparable number of individuals not operating as a team. This finding tends to disprove the old theory that supervision on the individual basis is superior to that on the group basis."

"... (in considering) the effectiveness of channels of communication, a relatively small group in our whole population seems to be exposed to virtually everything, while about five per cent of the people appear to be isolated from all channels of communication. Between these extremes the great mass of the public varies widely in its reaction to the various mass media. Among these media, the daily newspaper has the widest reach, being read by approximately 80 per cent of the population. Effectiveness of communication is measured largely by indi-

vidual and group needs and interests."

"... in a voting situation where an individual is faced with cross-pressures (such as a feeling of loyalty for one political party while at the same time desiring to vote for the candidate of another party) there is a strong tendency to delay making a decision. Under such conditions a certain number of individuals tend to lose interest in the campaign and seek to reduce their difficulty by 'escaping from the field of conflict,' in other words by not voting. Thus, a particularly tight political contest with heavy cross-pressures may actually drive voters away from instead of to the polls."

During the year it was increasingly apparent that newspaper publishers were coming to endorse modern public relations principles and practice by setting up their own public relations departments and by engaging in intraprofessional public relations competitions such as that sponsored by the Inland Daily Press association in collaboration with the William Allen White school of journalism and public information of the University of Kansas, Lawrence.

(D. O'B.)

Public Utilities. The widening influence of rate increases by public utilities in the United States upon consumer budgets had by 1952 led to new legislation in some states. In Kentucky a law drafted by the legal staff of the public service commission and supported by the Municipal league prohibited a utility from putting rate increases into effect immediately upon application to the commission. Under this law, a utility was required to wait at least five months unless the increase was approved earlier by the commission. If the commission should reach no decision within the time limit, the increase might go into effect without the posting of a bond; but such increases would be subject to later modification by the commission and consumers might sue for refunds with recovery of all costs. This eliminated the last of the states requiring the posting of a bond to assure refunds. Similarly, a Michigan statute prohibited the state commission from acting upon petitions for rate increases until all cities affected had been notified and until a report concerning the merits of such increases had been received from the technical staff. Such legislation was symptomatic of the reluctance of commissions to give speedy increases in rates as a consequence of the spreading inflation.

The delay in acting upon emergency increases in rates was creating widespread discussion in public utility circles of the menace of the "regulatory lag." In order to ease the effect of inflation upon the net earnings of public utilities, legislation was being considered which would shorten these suspension periods, require interim rate-making or reintroduce automatic regulation in the shape of service-at-cost plans. In the meantime, management was helpless in the face of inflationary pressures. As was illustrated in the case of the 25,000 employees of the Consolidated Edison system, utilities were constrained to agree to wage increases before applying for rate increases. Electric and gas utilities had sufficient margins of net income, so that they could rely upon increases in the volume of business and upon cost-reducing improvements to counteract in part these inflationary pressures. The telephone industry was less favourably situated. The transit industry in urban centres was in a desperate situation. Wages and fringe benefits absorbed 60% to 65% of gross revenues. With declining traffic and increasing costs, margins were disappearing and receiverships, partial and total abandonments and conversion to public ownership were becoming the order of the day. It appeared that only a policy of subsidy, tax exemption, co-operation from urban planning authorities and public ownership—according to variations in local conditions—would preserve

these urban agencies of mass transportation.

Surveys and Reports.—The electric utility industry had a dependable capacity of 75,000,000 kw. at the end of 1951. In view of the inadequacy of these generating resources during the rearmament period, an Electric Power Advisory committee was asked to investigate needed power requirements and to report its findings to Chairman Manly Fleischmann of the Defense Electric Power administration. This so-called Morehouse report was submitted at the close of 1951 and included comments upon the scheduled new installations of 9,500,000 kw. for 1952, of 12,200,000 kw. for 1953 and of 8,400,000 kw. for 1954. Since these construction schedules assumed normal water conditions, the report anticipated a deficit of 1,000,000 kw. should rainfall turn out to be below normal. The committee's fear was being realized by the drought conditions which parts of the country experienced during 1952 and power shortages were appearing in the middle west (where much of the defense production was localized) and particularly in the TVA area. Other shortages existed in the Pacific northwest and the Pacific southwest.

The American Gas association reported a continuation of the phenomenal expansion of the natural gas branch of the industry. Of an estimated 26,000,000 gas customers at the end of 1952, more than 18,000,000 or 71% were natural gas customers. A total of 1,514,000 new gas house-heating customers were added during the 1951-52 heating season and more than 1,000,000 other new ones were anticipated for each of the next two heating seasons. Natural gas was being sold over almost the entire country by means of 342,500 mi. of gathering, transmission and distribution pipe lines, with only the Pacific northwest remaining as a major unserved area.

The unprecedented expansion after World War II in the electric power and gas supply industries raised the question of the adequacy of the country's energy resources. An answer to this question, and others relating to U.S. materials resources, was provided by the report of the President's Materials Policy commission, the so-called Paley report. Obscured by the national election campaign, this report, published in five volumes in June 1952, surveyed the outlook for energy sources and for key commodities. It also dealt with the promise of technology in augmenting these natural resources. Combined with the 1950 report of the Water Resources Policy commission, these findings provided an inventory of all the more important materials and energy resources available within the borders of the United States or available as imports from sources within the free world.

The report surveyed the utilization of these resources in the past and projected, by means of a long-range forecast, requirements under "cold war" conditions to 1975. With respect to the country's primary energy requirements from oil and gas wells, water power, coal, lignite and shale and from imported fuels, the conclusion was that energy requirements would double. Reducing them to a common standard of bituminous coal equivalent, they would rise from 1,300,000,000 tons in 1950 to 2,600,000,000 tons by 1975. Since much of this energy is best used in secondary forms like electricity, gasoline, fuel oil and coke, requirements for liquid fuels and for electricity with their attendant conversion losses would consume additional amounts of primary energy. Liquid fuels are most important for defense purposes and for certain civilian uses in transport (air, water and land) and by other public utilities. It was estimated that the geological stockpiles of fossil fuels—natural gas and oil—would prove inadequate to meet these needs. The only renewable energy source was water power, which in 1952 was supplying one quarter of the country's electric output. By developing the remaining domestic potential water power as electric output, that source would continue to supply one quarter of the total

requirements until 1975. The remainder would have to come from fossil fuels, especially coal and lignite. The rising demand for secondary energy forms would put an upward pressure on prices. This would make possible imports and the finding of new domestic sources. In time the only adequate reserves would be coal, which could last, at least theoretically, for centuries. With increasing resort to coal, a slow shift in energy technology was in prospect. The shift between the different primary sources would be a matter of consumers' choice, guided by the lowest cost combination of the energy mix. Even with this flexibility, the gradual shift to coals, lignites and shales would encounter technological difficulties in making the conversion from primary to secondary forms of energy. Public utilities would operate in the very centre of this utilization and conversion process. (See also DAMS; ELECTRICAL INDUSTRIES; ELECTRIC TRANSPORTATION; FEDERAL POWER COMMISSION; MATERIALS POLICY COMMISSION; RAILROADS; RURAL ELECTRIFICATION; TELEGRAPHY; TELEPHONE; TENNESSEE VALLEY AUTHORITY.) (M. G. G.)

Canada.—The federal budget tax relief for public utilities engaged in "the distribution to or generation for distribution to the public of electrical energy, gas or steam" underlined the acute nature of the pressures upon most Canadian public utilities during 1952. They were pressures of active demand and greatly increased operating costs. The federal tax relief was based on a formula that reduced the tax to 43% of the former rate of tax payable.

Early in the year the Board of Transport Commissioners authorized increased rates for the Bell Telephone company which would give it an additional \$14,339,000 a year. It was about 75% of what the company asked. Of the revenue produced by the increase, \$7,827,000 was slated for federal and provincial taxes. (C. Cy.)

Puerto Rico. A United States commonwealth in the West Indies, Puerto Rico has an area of 3,435 sq.mi. Population (1950 census): 2,210,703; (Jan. 1, 1952, est. 2,238,272). In 1950, rural population comprised 59.5% of the total, urban, 40.5%. Chief cities (1950 census final figures): San Juan, the capital (including Río Piedras which was annexed in 1951: 357,205); Ponce (99,492); Mayagüez (58,944); Caguas (33,759); Arecibo (28,659). Languages: Spanish and English. Religion: predominantly Roman Catholic. Governor in 1952: Luis Muñoz Marín.

History.—The constituent assembly met for five months and finally approved the constitution of the commonwealth of Puerto Rico on Feb. 6, 1952. On March 3 the document was submitted to the Puerto Rican electorate in a special referendum. Of a total of 457,572 persons, 81.9% voted for the constitution, which was then sent to the president of the United States for the proper congressional action as provided in public law 600. Final favourable action was taken by the U.S. congress and the legislation was signed by Pres. Harry S. Truman on July 3, 1952.

The commonwealth of Puerto Rico was officially founded and proclaimed by Governor Muñoz Marín on July 25, 1952, Puerto Rico thus becoming a wholly autonomous state voluntarily associated with the United States.

Education.—Total enrolment in 1952 in the public and private schools of Puerto Rico was 487,518, of which 94.8% attended public schools as follows: elementary, 348,287; secondary, 104,316; vocational, 9,382. Of the total public and private school pupils, 74.9% were enrolled at the elementary level. The number of teachers in public schools was 9,796.

Total expenditures for public education, including capital improvements but excluding the state university, during 1951-52 totalled \$38,200,000, of which \$31,200,000 was appropriated by the state government and \$7,000,000 by the federal government.

Enrolment at higher levels totalled 15,446, of which 86.8% was regis-

tered at the University of Puerto Rico, San Juan. Other institutions of higher learning were: Polytechnic Institute of Puerto Rico at San Germán, College of the Sacred Heart at Santurce, Catholic University of Santa Maria and the Puerto Rico Junior college.

Banking and Finance.—Total bank deposits as of June 30, 1952, amounted to \$282,100,000; bank loans, \$190,700,000; and bank debits \$366,800,000. Total bank assets amounted to \$381,800,000.

Total revenues of the government of Puerto Rico for the general fund and for those special funds related to central government operations during fiscal year 1952 totalled \$134,199,000, of which \$115,300,000 was received into the general fund. Total appropriations for central government purposes, including special funds and the general fund, amounted to \$151,857,000, of which \$126,000,000 belonged to the latter fund. The free cash surplus in the general fund as of June 30, 1952, amounted to \$7,552,000, excluding: (1) an estimate of \$4,700,000 special funds surplus; (2) \$7,700,000 in the debt redemption fund; and (3) a \$10,000,000 emergency fund.

Trade.—Puerto Rico's external trade during the calendar year 1951 may be summarized as follows: the value of all imports was \$442,903,245, of which \$404,500,000 represented shipments from the United States. The total value of exports was \$264,413,227, of which \$249,700,000 worth of merchandise was shipped to the United States.

Communications.—As of June 30, 1952, motor vehicles registered totalled 76,750. Passable by motor vehicles, the estimated urban mileage of streets totalled 770, and the rural mileage of roads, 3,770. Passenger traffic totalled 457,715 persons, of whom 198,051 arrived at the island and 259,664 departed. More than 95% of the passengers travelled by air. Air cargo totalled 11,600,000 lb., of which 69% was inbound cargo. As of June 30, 1952, there were 39,285 telephones in service and 23 radio stations in operation. The average daily circulation of the two most important newspapers was 133,608.

Agriculture.—Crop yields for 1952 were as follows: sugar cane, 12,500,000 short tons; tobacco, 281,297 cwt.; pineapples, 637,599 crates; coconuts, 23,800,000 nuts; and coffee, 300,097 cwt. The total gross income from agriculture for 1951-52 was estimated at \$227,900,000 compared with \$199,900,000 in 1951. Of the 1952 total, \$117,600,000 represented farm value of sugar cane compared with \$106,400,000 in 1951.

According to preliminary data of the 1950 census of agriculture there were 53,515 farms (of three or more cuerdas) comprising 1,844,886 cuerdas, of which only 41.7% was used for crops.

Manufacture.—Sugar production for the 1952 season amounted to 1,332,381 short tons (raw value), of which 212,391 tons were refined on the island. During fiscal year 1952, production of blackstrap molasses amounted to 69,800,000 gal.; distilled spirits, 3,100,000 proof gallons; and beer produced, 9,600,000 gal. The total value of construction permits granted during the fiscal year amounted to \$83,100,000. Electric power generated amounted to 698,400,000 kw.hr., of which 39.5% was hydroelectric power.

According to the 1949 census of manufactures, there were 1,998 manufacturing establishments on the island, employing a total of 55,137 persons who earned \$49,200,000 in salaries in 1949. The total value added to products by manufacture amounted to \$93,400,000. (C. A. VA.)

Mineral Production.—The accompanying table shows the tonnage and value of mineral commodities produced in Puerto Rico in 1949 and 1950,

Mineral Production of Puerto Rico

(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Cement (bbl.).	3,187,000	\$8,299,000	2,171,000	\$6,109,000
Lime	8,000	181,000	7,000	184,000
Salt	14,000	137,000	13,000	77,000
Sand and gravel	101,000	104,000
Stone	250,000	575,000	520,000	827,000
Other Minerals	1,000	..	216,000
Total		\$9,297,000		\$7,413,000

*Value included with other minerals.

listing all items whose value exceeded \$100,000. Data for 1951 were not yet available.

Pulitzer Prizes. The annual Pulitzer prizes in journalism, letters and music, first awarded in 1917, were established at Columbia university by the will of Joseph Pulitzer. The five 1952 prizes in letters, of \$500 each, were awarded as follows: fiction award to Herman Wouk for *The Caine Mutiny* (Doubleday); biography award to Merlo J. Pusey for *Charles Evans Hughes* (Macmillan); history award to Oscar Handlin for *The Uprooted* (Little, Brown); poetry award to Marianne Moore for *Collected Poems* (Macmillan); and drama award to Joseph Kramm for *The Shrike* (Random).

Journalism prizes were awarded as follows: the meritorious public service medal to the *St. Louis Post-Dispatch* for exposing evidence of political immorality in federal government departments; \$500 awards to each of the following individuals: for local reporting to George de Carvalho, of the *San Francisco Chronicle*, for his stories of a ransom racket extorting money from Chinese in America for relatives held prisoner in Red China; for national reporting to Anthony Leviero, White House

correspondent for the *New York Times*, for his exclusive article disclosing the record of conversations between Pres. Harry S. Truman and Gen. Douglas MacArthur at Wake Island; for international reporting to John M. Hightower, diplomatic editor of the Associated Press, for "the sustained quality of his coverage of news of international affairs during the year"; for editorial writing to Louis LaCoss, of the *St. Louis Globe-Democrat*, for his editorial entitled "The Low Estate of Public Morals"; the cartoon award to Fred L. Packer, of the *New York Mirror*, for his drawing of a White House press conference entitled "Your Editors Ought to Have More Sense Than to Print What I Say!"; for news photography to John Robinson and Don Ultang, of the *Des Moines Register and Tribune*, for their photo of an incident at a football game. Special citations were given to the *Kansas City Star* for editorial planning, organization and execution of news coverage of the great regional flood of 1951 and to Max Kase, sports editor of the *New York Journal-American*, for his exclusive exposures of corruption in basketball.

The Pulitzer prize in music, first given in 1943, was awarded to Gail Kubik for his *Symphony Concertante*. (A. J. RR.)

Purcell, Edward Mills (1912-), U.S. physicist and Nobel prize winner, was born at Taylorville, Ill., on Aug. 30 and received his bachelor of science degree from Purdue university, West Lafayette, Ind., in 1933. The following year (1933-34) he was an international exchange student at the Technische Hochschule at Karlsruhe, Ger. Returning to the United States, he was awarded his master's degree from Harvard university in 1935 and his Ph.D. in 1938. In the latter year he was appointed instructor in physics at Harvard; he was advanced to associate professor in 1946 and to full professor of physics in 1949. During World War II, at the Massachusetts Institute of Technology and elsewhere, Purcell did fundamental research that helped lead to the perfection of radar. He was also credited with the research that aided in the discovery of huge clouds of hydrogen in interstellar space. For his work in developing the so-called "nuclear resonance" or "nuclear induction" method of measuring the magnetic fields of the nuclei of atoms, Purcell was named co-winner with Felix Bloch of the 1952 Nobel prize for physics, announced in Stockholm, Swed., on Nov. 6, 1952. Purcell and Bloch had worked independently to develop the same technique of measurement for which they were honoured.

Quebec. The largest Canadian province, Quebec is located along the lower St. Lawrence river. Area: 594,860 sq.mi., of which 71,000 sq.mi. are water. Pop.: (1951) 4,055,681. Capital: Quebec city; pop.: (1951) 161,439, metropolitan area 271,236. Chief city: Montreal (q.v.) 1,002,703, metropolitan area, 1,370,044.

History.—The legislature, which began its sessions in Nov. 1951, prorogued on Jan. 23, 1952. Among its enactments were laws to lower succession duties; increase the province's contribution to rural electrification from \$15,000,000 to \$20,000,000; increase the amount which could be loaned to farmers by the Quebec farm credit bureau; and establish pensions for the needy and the blind (both in co-operation with the federal government). Premier Maurice Duplessis, National Union party, called an election for July 16. When the votes were counted the National Union party dropped from the 82 seats it had won

in the 1948 election to 68; the Liberals rose from 8 to 23; 1 independent was elected; the 23 Co-operative Commonwealth federation (socialistic) candidates were all defeated. Duplessis alone of all the provincial premiers refused to sign a federal-provincial tax agreement.

Education.—From 1945 to 1951 the provincial government granted \$42,200,000 for the construction of 1,290 schools and equipment of 3,703 classrooms (for 102,000 pupils); from 1946 to 1951, \$9,000,000 was spent on construction of technical schools and art and trade schools.

Health and Welfare.—In the 1944-50 period the government made \$36,200,000 available for the construction of hospitals, which resulted in 22 new hospitals and sanatoria and the enlargement of 29 others, adding a total of 9,350 beds. The workmen's compensation act was amended to permit payment of 70% of wages instead of 66% for permanent disability; maximum wages on which compensation could be based was raised from \$2,500 to \$3,000.

Transportation.—In the 1949-52 period a total of \$1,555,000,000 was spent on roads, which extended 23,857 mi. (of which only 1,999 mi. were kept open during winter months).

Finance.—Provincial revenues for the fiscal year ending March 31, 1951, totalled \$270,590,400 and ordinary expenditures \$206,992,000. There were capital expenditures amounting to \$62,429,000, leaving a net surplus of \$1,169,400. Net public debt at March 31, 1951, was \$256,000,000.

Agriculture.—Preliminary estimates showed that Quebec farmers received a record \$432,700,000 cash income from the sale of farm products in 1951, compared with \$361,400,000 in 1950. The gross value of 1951 field crops was set at \$203,700,000. The farm credit bureau had \$85,000,000 on loan to 35,241 farmers. The provincial government tightened its ban against the sale of margarine by making mere possession thereof a crime.

Industry.—In the 1939-51 period the number of industrial plants increased from 8,400 to 14,000 and gross value of manufacturing from \$1,045,000,000 to \$4,500,000,000. In 1939 the employment index was 100, and the average weekly earnings were \$21.26; in 1951 the index was 168.5 and the average earnings had increased to \$47.37. By July 1952 the index had risen to 176.6 and the weekly earnings to \$51.40.

Minerals.—In the 1939-51 period the gross value of mineral production increased from \$69,000,000 to \$250,000,000. Asbestos continued to be the most important single mineral product, valued at \$75,000,000 in 1951; gold \$39,000,000; copper \$38,700,000; zinc \$34,000,000; silver \$3,900,000.

Radio. The best available estimates placed the number of radio stations in operation or being constructed throughout the world in 1952 at about 7,000. This figure, representing no substantial change from the 1951 total, included boosters or relay as well as broadcast stations, but did not count the television (TV) and frequency modulation (FM) stations.

The number of radio receiving sets in use throughout the world was estimated at about 175,000,000 to 180,000,000, compared with 171,000,000 to 175,000,000 in 1951. In the U.S. alone there were approximately 105,300,000 sets, a gain of about 1,000,000 since the end of 1951. The A. C. Nielsen company research organization reported that the number of homes with radio receivers had reached 43,866,120, or 98% of all homes in the nation. This compared with a total of 40,970,000 reported by the 1950 census.

U.S. Stations.—The year 1952 was one of steady development for radio and of boom for television, with licences for new TV stations being issued again for the first time since Sept. 1948.

Broadcasting-Telecasting magazine's box score, based on official records of the Federal Communications commission, showed 3,302 broadcasting stations were in operation or had been authorized by Oct. 1952. This figure, which included amplitude modulation (AM), FM and television stations, may be compared with 3,161 the year before. The number of stations actually on the air in Oct. 1952 was the largest ever: 3,101, as against 3,083 at the end of 1951.

Broadcasting-Telecasting reported that the number of AM stations was 2,474 in October; of these, 2,355 were in operation. At the end of 1951 the AM total had been 2,406, of which 2,295 were operating. The FM station total went up for the first time

in several years, rising from 648 to 655, of which 635 were in operation.

In TV, FCC's licensing freeze was lifted, effective July 1, and on July 11 the licensing agency issued its first television station authorizations in almost four years. By early October a total of 68 new stations had been authorized, in addition to the 109 already on the air. Of the 68, 59 were authorized to operate commercially, while 9 were slated for noncommercial, educational operation by schools and the like. With the number of applicants exceeding the number of channels available in most major cities, making it necessary for the FCC to hold hearings, authorities felt that several years would pass before the 2,000-odd stations anticipated by the FCC would be authorized.

Applications for new AM stations awaiting action by the FCC stood at 310 at the start of Oct. 1952—the same figure recorded in Dec. 1951. In FM, 22 applications were pending, compared with 11 in 1951. The number of television applications was 765 and was rising.

Transit Radio.—This major FM development, the broadcasting of specialized programs (usually music and news) to receivers installed on streetcars and buses, received a boost from the U.S. supreme court in May 1952. The court overruled a lower tribunal's decision that transit radio's "commercials and announcements" deprive "objecting passengers of liberty without due process of law" and, accordingly, are unconstitutional. The supreme court decision, adopted on a 7-to-1 vote, said that "neither the operation of the service nor the action of the [Public Utilities] Commission permitting its operation is precluded by the Constitution." The commercial feature of the service, the decision continued, "bears some relation to the long-established practice of renting space for visual advertising on the inside and outside of streetcars and buses."

But, although transit radio won a substantial victory in the court, its status at the FCC remained somewhat cloudy, along with that of other special FM services which employ a "beep" signal for switching voice programming. These functional services, including those broadcasting programs for reception in stores, restaurants and factories as well as streetcars and buses, requested the FCC to conduct a hearing and settle the issue on an industry-wide basis.

U.S. Commercial Broadcasting.—The year 1951, latest for which official reports were available by Oct. 1952, was a banner one in time sales, with total radio (AM-FM) revenues of networks and stations reaching a record high of \$450,400,000, a gain of 1.3% over 1950 totals. Net income (before federal income tax), however, dropped 15.7% to a total of \$57,500,000. The FCC said that "this decrease was the result of a reported drop of almost 50% in the earnings of the networks from radio operations, coupled with a slight decline of about 4% in the earnings of individual radio stations."

Counting \$235,700,000 in TV revenues, total broadcast receipts amounted to \$686,100,000 in 1951 as against \$550,400,000 in 1950. This represented a gain of 24.7%. The FCC's summary

Table I.—Radio and Television Broadcast Receipts, Expenditures and Income

Service	1951	1950	Per cent increase or decrease in 1951
Total broadcast revenues			
Radio (AM and FM)	\$450,400,000	\$444,500,000	1.3
Television	235,700,000	105,900,000	122.6
Industry total	\$686,100,000	\$550,400,000	24.7
Total broadcast expenses			
Radio (AM and FM)	\$392,900,000	\$376,300,000	4.4
Television	194,100,000	115,100,000	68.6
Industry total	\$587,000,000	\$491,400,000	19.5
Broadcast income (before federal income tax)			
Radio (AM and FM)	\$ 57,500,000	\$ 68,200,000	-15.7
Television	41,600,000	-9,200,000	—
Industry total	\$ 99,100,000	\$ 59,000,000	68.0

FINAL BRIEFING on script revisions before a broadcast of "The Big Show," early in 1952, starring Tallulah Bankhead (seated, second left)

of the breakdown between radio and television in three basic financial categories is shown in Table I.

The 4 nation-wide radio networks, 3 regional networks and 25 stations owned by these networks accounted for \$104,029,000 of total broadcast revenues in 1951, representing a 5.8% drop from their 1950 figure. With their expenses up 2.7% to a total of \$93,934,000, these same networks and stations reported net income of \$10,095,000, or 46.8% less than in 1950.

Receipts from the Sale of Time.—Time sales, which are the financial backbone of broadcasting, edged up 0.6% to a new record high of \$456,112,000 in 1951, according to the FCC report. Revenues from the sale of network time were off 7.2% with a total of \$122,034,000. Sales of nonnetwork time to national and regional advertisers accounted for \$119,559,000 (a gain of 0.6% over 1950), while sales to local advertisers gained 5.6%, reaching a total of \$214,519,000. It was the first time, the FCC noted, that sales of nonnetwork time to national and regional advertisers had exceeded nation-wide network time sales.

These figures included commissions paid to agencies, etc.,

Table II.—Comparative Financial Data of Radio Networks and Stations*

Radio Networks and Stations	1951	1950	Per cent increase or decrease
Revenues, sale of network time . . .	\$122,034,000	131,530,000	— 7.2
Revenues, nonnetwork time sales to national, regional sponsors . . .	119,559,000	118,824,000	0.6
Revenues, time sales to local advertisers . . .	214,519,000	203,211,000	5.6
Commissions to agencies, etc. . . .	51,561,000	52,476,000	— 1.7
Revenues from talent sales, etc. . .	44,675,000	41,969,000	6.4
Total broadcast revenues	449,226,000	443,058,000	1.4
Total broadcast expenses	389,975,000	372,315,000	4.7
Broadcast income before federal income tax	59,251,000	70,743,000	—16.2

*Seven networks and 2,200 stations were covered in the 1951 report, which did not, however, reflect financial data of 66 independently operated FM stations. The 1950 report covered 7 networks and 2,143 stations.

which broadcasters consider an expense of sale. Payments of this nature amounted to \$51,561,000 in 1951, a decline of 1.7% from the 1950 total. The figures were based on reports from 4 national and 3 regional networks and 2,200 stations (not including 66 independently operated FM stations), whereas the 1950 figures covered 4 national and 3 regional networks and 2,143 stations.

Radio Industry Balance Sheet.—The basic financial data on the radio industry for the years 1951 and 1950 are shown in Table II.

Tangible Broadcast Property.—Four national networks, 3 regional networks and 2,186 stations had a total original investment of \$254,731,197 applicable to radio operations, the FCC said in its 1951 report. Depreciation of these properties to date was placed at \$104,933,967. The report did not cover 66 independently operated FM stations; 14 other stations reported no owned tangible broadcast property.

Table III, issued by the FCC, shows tangible broadcast property ownership according to class of stations.

Average Station Revenues and Expenses.—The FCC reported that the average AM station built before World War II received almost \$300,000 in total revenues in 1951 and, out of this,

Table III.—Tangible Broadcast Property Applicable to Radio Operations for All Networks and Stations*

Class of station	Number of stations	Cost to licensee	Depreciation to date under ownership of licensee	Depreciated cost
Clear channel, 50 kw. . . .	65	\$ 36,267,131	\$ 16,946,193	\$ 19,320,938
Clear channel, 5–25 kw. . .	54	12,040,786	5,126,965	6,913,821
Regional	1,047	125,540,145	47,358,833	78,181,312
Local	995	50,252,294	18,071,888	32,180,406
All stations	2,161	\$224,100,356	\$ 87,503,879	\$136,596,477
4 nation-wide networks, including owned stations . .	18	\$ 29,533,422	\$ 16,446,032	\$ 13,087,390
3 regional networks, including owned stations . .	7	1,097,419	984,056	113,363
All networks and stations . .	2,186	\$254,731,197	\$104,933,967	\$149,797,230

*Does not include 66 independently operated FM stations; 14 other stations reported no owned tangible broadcast property.

DIAGRAM OF THE PATH of a radio message directed at the moon in Morse code from Cedar Rapids, Ia., and received in Sterling, Va., near Washington, D.C., via ultra-high frequency signals reflected from the moon. The experiment was reported on in 1952 by the National Bureau of Standards

earned a profit of slightly more than \$50,000 before federal income tax. The average station built since World War II, but not counting those in operation less than two years, received almost \$100,000 in revenues and earned a profit of approximately \$7,500.

One-half of all radio stations, the FCC said, had total revenues of less than \$100,000. In this revenue group, average earnings ranged from a little more than \$5,000 for network affiliates to about \$3,000 for stations not affiliated with a network. In all, 44% of the total stations reported revenues between \$100,000 and \$500,000; of these, network affiliates averaged \$28,000 in earnings and nonnetwork stations slightly more than \$17,000. A total of 116 stations, or 6%, enjoyed revenues exceeding \$500,000; average earnings in this group were \$216,000 for network affiliates and \$159,000 for nonaffiliates. All earnings figures were before federal income tax.

Losing Stations.—A total of 519, or 24%, of the almost 2,200 reporting AM stations indicated that they took financial losses in 1951. These, the FCC said, represented the smallest proportion of AM losers since 1946, when the postwar boom in station construction got under way. A total of 400 of the losers commenced operation after World War II; these composed 29% of the 1,384 stations which went on the air after that date. Of the 800-plus prewar stations, 15% reported losses during 1951.

For the first time, the FCC said, the proportion of AM losers was greater in cities with television stations than in non-TV markets. The report showed that almost 31% of AM stations with TV competition lost money, while the number without TV competition which nevertheless lost money was 21%. Hardest hit, apparently, were nonnetwork affiliates in TV markets: 36.5% of these stations reported losses for the year.

FM Finances.—FM station operation continued in 1951 to be generally unprofitable. The FCC reported, for example, that of the 66 independently operated FM stations—that is, FM stations without AM affiliates—60 experienced losses from 1951 operations. In the case of FM stations operated in conjunction with AM stations, it was difficult to distinguish the expenses of one station from those of the other.

U.S. Programs.—The ten most popular programs on the air in the third week of Aug. 1952 are shown in Tables IV and V, prepared from measurements made by the A. C. Nielsen company, Chicago, which publishes "Nielsen-Ratings" of programs. Alongside the Aug. 1952 ratings of these programs are shown

their respective standings and ratings of Aug. 1951, if they were in the so-called "top ten" at that time. The tables separate daytime and evening programs.

Generally speaking, the trend to develop new radio shows to compete with the attraction of television continued in 1952. There also was increased interest, among broadcasters, in lower-cost shows. Music and news remained highly attractive.

The fact that 1952 was a presidential election year left a clear imprint upon radio programming. In addition to the politicians' heavy reliance upon radio-TV as a fundamental campaign tool, radio and its visual affiliate won high praise for their coverage of the Republican and Democratic presidential nominating conventions in July, their reporting of the pre-convention campaigns of the principal candidates and the campaigns of the nominees afterward, and for coverage of the returns of the voting.

U.S. Nation-Wide Networks.—The number of nation-wide radio networks in the U.S., which increased from four to six in 1950 and dropped back to five with the suspension of activities by the Progressive Broadcasting system in 1951, returned to four in 1952 when the youngest network, the Liberty Broadcasting system, suspended service to its affiliates on May 15. The company, which had almost 400 affiliated stations at that time, was in process of resuming operations on a much more limited scale later in the year.

Table IV.—Top-Rated Evening Network Radio Programs in the U.S.

Program	Rank		Nielsen rating*

The four "old-line" networks were the American Broadcasting company (ABC), the Columbia Broadcasting system's CBS Radio network, the Mutual Broadcasting system (MBS) and the National Broadcasting company (NBC). CBS Radio marked its 25th anniversary in September but did so without fanfare, in contrast with NBC's 25th anniversary celebration with special programs throughout half of 1951. MBS, for the first time, came under the operating control of a single stockholder, the General Tire and Rubber company, through stock acquisitions approved by the FCC in January; and on May 31 General Tire's Thomas F. O'Neil, already board chairman of MBS, took on the additional duties of president, succeeding Frank White. Meanwhile, the proposed merger of ABC with United Paramount Theatres, a major motion-picture theatre company, was the subject of FCC hearings throughout most of the first three quarters of 1952, and it was thought the federal agency would give its final decision on the \$25,000,000 deal by early 1953.

In moves attributed primarily to the force of television competition, three of the four national radio networks realigned their cost structures to reduce, by about 25%, their advertising charges for evening time. In the same moves, daytime radio charges were increased by about 5%. First to act was CBS Radio, which made its changes effective Aug. 25. NBC and ABC followed on Oct. 1, and MBS was reported working on similar changes early in October.

U.S. Organizations; Regulation.—There were no major changes in the administration of either the broadcasters' trade association, the National Association of Radio and Television Broadcasters (N.A.R.T.B.), or the radio industry's autonomous sales promotion agency, the Broadcast Advertising bureau (B.A.B.). N.A.R.T.B. was headed by Pres. Harold E. Fellows. B.A.B., under Pres. William B. Ryan, won independent status after its formative period as an arm of N.A.R.T.B. and, with a budget approaching \$1,000,000, launched a series of projects to promote the use of radio as an advertising medium.

Glen McDaniel, first paid president of the Radio-Television Manufacturers association (R.T.M.A.), resigned effective Oct. 1, and the organization's directors voted to return to the system of unpaid presidencies. James D. Sechrest, general manager, was elevated to executive vice-president, and Board Chairman A. D. Plamondon, Jr., was given the additional office of president. In another trade organization, the National Association of Radio and Television Station Representatives (N.A.R.T.S.R.), Murray Grabhorn resigned as managing director and was succeeded by T. F. Flanagan on April 1. Later in the year N.A.R.T.S.R. simplified its name, changing it to Stations' Representatives association (S.R.A.). Broadcast Music Inc. (B.M.I.), licensing and publishing organization founded by the broadcasting industry, continued to expand under the supervision of Pres. Carl Haverlin.

The first major revision of the fundamental law governing radio, the Communications act of 1934, was passed by congress in early July and subsequently signed into law by Pres. Harry S. Truman. Known as the McFarland bill for its sponsor, Sen. E. W. McFarland (Dem., Arizona), the new law dealt largely with administrative operations of the FCC. Among the provisions directly affecting broadcasters was one prohibiting stations to charge political candidates higher rates than "the charges made for comparable use of such station for other purposes."

In midyear a house committee launched an investigation of so-called "immoral or offensive" radio and TV programs which generated widespread publicity and controversy. The probe, still in progress in October, was set in motion by passage of a resolution introduced by Rep. E. C. Gathings (Dem., Arkansas) to "determine the extent to which the radio and television programs currently available to the people of the U.S. contain

immoral or otherwise offensive matter, or place improper emphasis upon crime, violence and corruption." Representatives of the broadcasting industry contended they were policing their own programs and doing a progressively good job, and expressed fears that the house approach might lead to censorship. Sen. William Benton (Dem., Connecticut), who proposed in 1951 to set up a review board to study radio and television programming, said of the house investigation that it "is the wrong way to go about improving radio and TV programs."

Inter-American Agreements.—The "new" North American Regional Broadcasting agreement (N.A.R.B.A.), worked out in 1951 after long and controversial deliberations, still awaited U.S. senate ratification in 1952. A subcommittee appointed to study it did not act. Replacing an earlier treaty that had expired, the agreement was designed to govern AM broadcast allocations among the U.S., Canada, Cuba, the Bahamas and Jamaica and the Dominican Republic. (R. W. CR.; S. TF.)

International.—Jamming, and efforts to overcome it, became an accepted feature of the European scene in 1952. To the jamming of Russian and Polish broadcasts from western countries was added the jamming of transmissions in Finnish, Hungarian, Rumanian and Albanian by the British Broadcasting corporation (B.B.C.). Broadcasts in satellite countries' languages from Rome, Athens and Canada and by the "Voice of America" were also heavily jammed. For the first time the satellite radio organizations themselves took an active part in the jamming campaign, though they were not so efficient as jamming stations inside the U.S.S.R. There was ample evidence from the target areas to show that jamming did not blot out the transmissions for any substantial period of time.

The U.S.S.R. and its satellites increased their short-wave output considerably, in particular to western and southern Europe and to Scandinavia; their group output totalled nearly 1,200 hours a week in about 40 languages. At the same time Communist China expanded its external services, mainly to far eastern areas. Among western organizations the most notable expansion was that of Radio Free Europe, the privately sponsored U.S. station, which reached a total of 400 hours weekly, mainly in Czech, Hungarian and Polish. The "Voice of America" also expanded during 1952 and brought into service the ship "Courier," a seagoing radio station which began transmissions from an anchorage in the eastern Mediterranean. The B.B.C. was obliged by government economy to reduce its external services for the third year in succession. Italy's external broadcasting system continued to expand. Other countries that expanded their services during the year were Argentina and Australia. An interesting newcomer to the field was Syria. A program in Ukrainian was added to the Canadian service.

Great Britain.—In 1952 the B.B.C. renewed its charter for a further ten years, but only after modifications which declared that the B.B.C. should remain the sole custodian of British sound broadcasting but that the way should be opened for the setting up at a later date of a competitive television service, presumably financed by commercial advertising.

Among the year's notable broadcasts were the vivid sound pictures of the lying-in-state and funeral of George VI and the proclamation of Elizabeth II. Winston Churchill's tribute at the time of the king's death was regarded as one of his finest broadcasts.

The Olympic games at Helsinki, Fin., were fully reported. The home service started an important drama series called "The English Theatre," covering the previous 50 years. Works of Vaughan Williams, whose 80th birthday fell on Oct. 12, figured prominently in the first program on Oct. 15 of the 1952-53 season of B.B.C. symphony concerts. Arnold Toynbee gave the 1952 Reith lectures on "The Impact of the West on Other

Civilizations"; Bertrand Russell gave a notable series of "Portraits from Memory."

The Light program started a series of specially written radio plays and broadcasted a number of others chosen by star performers. Edgar Lustgarten's "Prisoner at the Bar" crime series was an exceptional solo presentation.

In the Third program a complete cycle of "The Ring," with *Parsifal* and *Die Meistersinger*, was broadcasted from Bayreuth, and the first world performance of Richard Strauss's *Die Liebe der Danae* came from Salzburg. At least one full-length opera was broadcasted each week, and chief of these was the Covent Garden presentation of Alban Berg's *Wozzeck*. A full-scale study of Arnold Schönberg included many concerts and talks. Important series of talks included Isaiah Berlin on "Freedom and Its Betrayal" and George Rylands' illustrated series on "Reading Poetry Aloud." Thomas Mann and Pablo Casals gave notable talks on "The Artist and Society." John Lehmann's monthly literary miscellany, "New Soundings," designed to provide an outlet for new writers, made an encouraging start. Readings from *The Faerie Queene* and several talks marked the fourth centenary of Edmund Spenser's birth.

Europe.—In western Europe, particularly in western Germany, there was intensive development of very high frequency (VHF) broadcasting for domestic services. Nordwestdeutscher Rundfunk alone operated 22 VHF stations in northwest Germany.

In France a new station was opened at Sélestat, near Strasbourg, in September to improve reception on domestic programs. It consisted of three medium-wave transmitters each of 100 kw. In October a new long-wave transmitter of 250 kw. was opened at Allouis. A large site was purchased in Paris, near Passy, for the new headquarters of Radio-diffusion et Télévision Françaises.

The third general assembly of the European Broadcasting union was held in Lugano, Switz., in October. Georges Conus of Switzerland was elected president. West German broadcasting stations, associated together for the purpose, attended as members for the first time.

British Commonwealth.—The South African Broadcasting corporation announced in July plans to build a new station near Bloemfontein. In East Africa plans were made to establish a new short-wave national service for Uganda as well as a medium-wave service for Kampala. In Kenya, Tanganyika and Northern Rhodesia programs for Africans were expanded. Two new provincial networks started operation in Nigeria to supplement the output of the national transmitter at Lagos. When broadcasting development was completed in this colony, approximately 370,000 sq.mi. and a population of 25,000,000 would be served. Experimental transmissions started in September on a ten-kilowatt medium-wave station at Nicosia in Cyprus. B.B.C. program and technical staff arrived in British Honduras toward the end of the year to establish new medium- and short-wave networks covering the territory. A five-kilowatt short-wave transmitter was sent to the Falkland Islands to provide a service for the sheep farming community. The total number of listeners in the British colonies was estimated in June at 3,000,000. (See also LAW.)

Railroad Accidents: see DISASTERS.

Railroads. The operation of the railroads under the token supervision of the U.S. army, which Pres. Harry S. Truman had ordered on Aug. 27, 1950, to avert a threatened nation-wide railroad strike, was terminated on May 23, 1952.

The railroads' traffic and earnings were adversely affected

during the year by a strike of eight weeks' duration in the steel industry and the consequent closing down or slowing up of production in related industries.

Operating revenues of the 132 Class I railways in the United States in the first eight months of 1952 aggregated \$6,810,999,610 compared with \$6,764,406,068 in the same period of 1951, an increase of 0.7%. Operating expenses for the same months of 1952 were \$5,298,347,702 compared with \$5,345,357,749 in the same period of 1951, a decrease of 0.9%. In the eight months ending Aug. 31, 1952, the net income of the Class I railroads was estimated at \$405,000,000, compared with a net income of \$339,000,000 in the same period of 1951, both figures after interest and rentals. The rate of return for the year ending Aug. 31, 1952, was 4.08%, compared with a rate of return of 3.96% for the year ending Aug. 31, 1951.

The Interstate Commerce commission's Bureau of Transport Economics and Statistics reported gross annual capital expenditures for additions and betterments for the first half of 1952 at \$715,200,000 compared with \$660,100,000 for the same period of 1951, an increase of 8.3%. Expenditures for road property increased 15.5% in 1952 over the corresponding period in 1951, while equipment expenditures increased by 6.2%. Estimates of 127 of the Class I railroads placed gross capital expenditures for road and equipment during the second half of 1952 at \$659,000,000, making an estimated total for the year of \$1,374,200,000, compared with actual expenditures of \$1,414,000,000 in 1951. This estimate placed road expenditures at 2.2% above 1951 levels and equipment expenditures at 4.5% below those of 1951.

One of the most noteworthy developments in railroad transportation in 1952 was the continuation and acceleration of the change-over from steam to diesel motive power. During 1952 diesel locomotives operating on railroads in the U.S. performed approximately 65% of freight service, more than 70% of passenger service, and more than 75% of yard and switching services. Of the diesel locomotives which were in service, 97% had been installed since 1940, and 82% since the close of World War II. In the two-year period, Aug. 31, 1950, to Aug. 31, 1952, the railroads in the United States installed 6,800 diesel locomotive units. It was predicted that in the following year the railroads would be operating more than 21,000 diesel units.

As of Aug. 31, 1952, the total number of freight cars owned by Class I railroads was 1,840,623, compared with 1,818,062 a year before, a gain of 22,561 freight cars of all types. In the same period 80,877 new cars were installed, and 58,316 old cars were retired from service. As of Aug. 31, 1952, the Association of American Railroads, Car Service division, reported 108,222 freight cars awaiting repairs as compared with 96,020 freight cars awaiting repairs a year earlier. The net serviceable railroad freight cars in service as of Aug. 31, 1952, was 1,732,401, as compared with 1,722,042 a year before. At the same date there were 78,825 freight cars on order. The average daily freight-car shortage as of the end of August was 4,924 cars, compared with 18,120 cars at the corresponding date in 1951. Revenue carloadings for the period of 1952 for which data were available averaged about 700,000 carloads a week.

The volume of freight traffic of Class I railways was about 5% lower, measured in revenue ton-miles, in the first half of 1952 than for the corresponding period of 1951. The total revenue freight traffic was 303,378,000,000 ton-miles in the first half of 1952, compared with 319,520,000,000 revenue ton-miles in the first half of 1951.

Freight traffic revenue declined very slightly from \$4,238,714,000 in the first half of 1951 to \$4,234,845,000 in the first half of 1952, a decrease of about 0.1%.

In the first half of 1952, Class I railways in the United States

performed 17,096,400,000 revenue passenger-miles, an increase of 3.9% over the 16,451,400,000 revenue passenger-miles in the same period of 1951. Passenger revenues increased from \$430,578,000 in the first half of 1951 to \$459,387,000 in the first six months of 1952, an increase of 6.7%.

On April 14, 1952, the Interstate Commerce commission authorized increases to be made in freight charges which superseded the previous increases authorized on April 4 and August 28, 1951. The new increased rates became effective May 2, 1952.

The order of the Interstate Commerce commission permitted the railroads to increase their rates and charges generally by 15%, to be applied as percentage increases in the amount of the total freight charges, exclusive of the federal transportation tax, and subject, in certain cases, to maximum increases in specific amounts per hundred pounds or per ton. Class rates generally were permitted to be increased by 15%, and rates upon certain commodities were allowed maximum increases, of which the following were representative: fresh fruits, vegetables, melons, nuts, canned or preserved food products, and some metals, such as copper, lead and zinc, increased 12 cents per 100 lb.; building woodwork and millwork, 14 cents per 100 lb.; sugar and syrup, 10 cents per 100 lb.; phosphate rock and salt, 60 cents per ton; muriate of potash, sulphate of potash and sulphate of potash magnesia, \$1 per ton; coal and coke, 12% subject to a maximum of 40 cents per ton; iron ore, sand, stone, slag and other related articles, 12%; and grain and grain products, 12%.

These increases brought railroad freight rates to a level of more than 167% of the rates in effect in 1946, and represented the 12th occasion in which railroad freight rates had been dealt with by the Interstate Commerce commission since the cessation of hostilities in World War II.

During 1952, the three military departments, army, navy and air force, represented collectively the largest user of transportation services in the world, and were individually among the largest shippers via all forms of transportation. The department of defense, representing the federal government, arranged for the transportation of more than 2,500,000 tons of freight monthly. In the government fiscal year, the military traffic service of the department of defense estimated that the department would spend about \$1,000,000,000 for domestic transportation alone. Military traffic was about three times the volume it had been in the period between World War II and the outbreak of the Korean war.

The Defense Transport administration continued in 1952 to function as the executive agency of the federal government, for the co-ordination and assistance of the domestic transportation system, including port and storage facilities, and for working with the railroads, water carriers, highway carriers and related facility operations to bring their equipment and plant into a state of readiness to assume the greater load which would be placed upon the transportation system in the event of enemy attack or full-scale war operations.

In this task, the Defense Transport administration sponsored a railroad freight-car building program to achieve the objective of a fleet of 1,850,000 freight cars in 1953. It also sponsored a program of diesel-electric locomotive construction, a program of railroad tank-car building, the construction of 20 new Great Lakes boats for bulk cargoes, the construction of more than 200 new and improved barges for inland waterway service, a highway vehicle building program and a warehouse and storage facility program.

In Oct. 1952 the Interstate Commerce commission made public a study made by its Bureau of Transport Economics and Statistics, part of a series of studies in industry economics sponsored by the air force. The study placed the annual capacity of

the railroads at about 685,000,000,000 revenue ton-miles of freight service, and 41,000,000,000 miles of passenger service under "preparedness conditions." Under war conditions, including a six-day work week and carloading orders similar to those in effect during World War II, the railroad capacity was estimated at 750,000,000,000 ton-miles and 83,000,000,000 passenger-miles. The railroad service requirements under assumed war conditions in the year "195X" were estimated at 950,000,000,000 ton-miles and 122,000,000,000 passenger-miles, approximately 27% and 47%, respectively, above the estimated 1952 railroad capacities for freight and passenger services. The report found that the railroads should continue to make large capital expenditures for freight and passenger equipment. (See also INTERSTATE COMMERCE COMMISSION; UNITED STATES.)

(G. L. WN.)

International.—Of greater importance than technical developments in 1952 was the continuing trend toward a more unified railway system for Europe under the aegis of the International Union of Railways. This union had been encouraged by the United States and actively participated in by the British railways.

Evidence of this movement was provided by the inauguration of a pooling system for freight rolling stock, known as Europa wagons, contributed by the French and German railways.

Great Britain.—For the first time since the nationalization of British transport in 1948 the British Transport commission earned in 1951 a small surplus after interest on capital. In 1952 costs were still rising and there were wage increases; the volume of traffic was about that of 1951. Proposed legislation, as outlined in a government white paper followed by a draft Transport bill, aimed at the sale of the nationalized Road Haulage executive's vehicles to private buyers and at greater decentralization on the railways. Meanwhile the government refused to permit the full increase in passenger fares as authorized by the Transport tribunal, London area fares being particularly affected.

CONFERENCE ROOM in an all-room parlour car on the "Congressional," an 18-car train on the New York-Washington, D.C., run of the Pennsylvania railroad. Placed in service in 1952, it was designed for the convenience of government officials, business executives and family groups

IRON ORE SHIPMENT leaving Bomi hills, Liberia, by rail in 1952. Liberia's first railroad, then in its first year of operation, was constructed by the Liberian Mining company with the help of technicians sent by the Baltimore & Ohio railroad

Steel shortages slowed up the construction of new rolling stock and delayed the completion of many improvement schemes at stations and of other railway facilities. Track renewals continued at a high rate, involving speed restrictions on many main lines and thereby preventing the return of the high-speed prewar expresses.

An important engineering development was the completion of the colour-light signalling installation between Clapham junction and Selhurst on the London-Brighton line. Eleven mechanically operated signal boxes were replaced by these all-electric ones; conversion to colour-light all-electric signalling was also carried out at Euston station, London. A new 7.5-mi. line was opened in September to the new Calverton colliery (Nottinghamshire). A British-built gas-turbine locomotive made successful trials between London and Plymouth; a diesel-mechanical locomotive was tested between London and Derby and several main-line diesel-electrics were working on London-Exeter trains.

In February the first stretch of Great Britain's first main-line electrification scheme was inaugurated between Wath and Dunford Bridge on the Sheffield-Manchester line. Two more of the 12 standard types of steam locomotives came into service: a Pacific 4-6-2 class with a 19-ton axle load for service in Scotland and a 2-6-2 tank engine for suburban working. Progress was made with the output of various types of standard freight cars; these were almost entirely made of steel and the growth in the number of steel freight cars justified the conversion of a repair shop near Exeter for their overhaul. For ore traffic a new type of 56-ton eight-wheel car was introduced with an empty weight of 28.5 tons.

London Transport placed in service on its underground lines some new multiple-unit electric vehicles made of light alloys. Tests were conducted with air-braked coal trains; these were run at high speeds and the general tendency was to increase

speed, even at the sacrifice of some reduction in train weight.

Mechanization of track repair and renewal work was steadily extended and one of Britain's largest freight stations, Bristol (Temple Meads), was re-equipped on the conveyor-belt system.

In October Britain's worst rail disaster since 1915 occurred when two expresses and a local train collided at Wealdstone station in Harrow. As a result of this tragedy 111 persons were killed and more than 200 injured.

In Ireland the Dundalk, Newry and Greenore railway, the last line to be owned by the British Transport commission in Ireland, was closed at the beginning of 1952.

Continental Europe.—French national railways (Société Nationale des Chemins de Fer—S.N.C.F.) turned over to electric traction the entire main line from Paris to Lyons with the completion of the conversion of the Chalon-Lyons section in June 1952. Services were greatly accelerated and it was planned to handle 20,000 metric tons of freight daily on this route. The S.N.C.F. did not neglect alternative forms of traction, and tests were conducted with a gas-generated locomotive.

Despite the success of the 50-cycle method of electrification in France, Belgium was to adhere to the 3,000-v. D.C. system for the extensions in construction and those already planned. The vital junction railway, linking the North and South stations in Brussels, was opened. The Netherlands railways inaugurated electric traction in February on the Amersfoort-Zwolle 42-mi. section and in May on the Zwolle-Meppel-Groningen line and also the line to Leeuwarden; thus 786 mi. was electrified, or 40% of the system.

In Germany long sections of welded rail and large numbers of reinforced concrete sleepers were laid in Bavaria. Reconstruction of war-damaged facilities continued and 200,000,000 DM. were to be spent on new works in 1952. Doubling continued on sections of Swiss main lines, notably between Zurich and Sargans—almost completed—and on the Bern-Lausanne line near Fribourg. Gotthard widenings were practically finished except on the causeway near Chiasso.

Italy, with its lack of coal, continued to electrify its railways—a current program related to the Bari-Pescara 186-mi. section on the Lecce-Bologna line—and D.C. traction was replacing the original three-phase system in northern Italy; *e.g.*, on the Brenner. An expensive nine-mile link from Piazza al Serchio to Pieve San Lorenzo was started. In Austria reconstruction of the old double-track Semmering tunnel continued, and the new adjoining single-track tunnel was opened in March.

Greece was adopting diesel rail-cars with considerable success, but in Cyprus the government railway closed in January, rail facilities being replaced by road. In Spain a 70-mi. section of the railway to link Corunna with Zamora was opened in September. Swedish State railways built a mobile refrigerator train and was doubling single-track sections on the Stockholm-Göteborg artery. In Norway construction continued on the Nordland line toward Bodo.

Asia.—Saudi Arabia railway was officially opened in Jan. 1952 from Dammam to Riyadh. Built by Aramco, the 350-mi. line cost about \$50,000,000; diesel traction was employed and a U.S. staff assisted. Ceylon imported new steam locomotives but Pakistan was turning to diesels, and converted the Jacobabad-Kashmir 76-mi. section to broad gauge. Indian railways' reorganization was completed by the inauguration of the Eastern, North Eastern and Northern railways.

In Malaya, the night Singapore-Kuala Lumpur mail was restored; and Indonesia profited by new German-built steam locomotives. In Siberia, Stalinsk and Barnaul—a 110-mi. stretch—were stated to be rail-linked.

Africa.—Algerian railway improvements included the introduction of Budd-type stainless-steel passenger cars of light-

weight design, and in Morocco a new line was constructed to serve the increasing output from the anthracite mines at Djérada. Further east, in Egypt, the state railways imported more than 70 new passenger cars fitted with roller bearings. Beyer-Garratt type articulated steam locomotives with a tractive effort of 52,360 lb. on a 13-ton axle load were added to the stock of the Benguela railway in Angola, and locomotives, also of Beyer-Garratt articulated design, were imported into Rhodesia to handle the rapidly increasing volume of traffic. On the East African Railways system traffic by 1951 had increased to more than double that of 1939, but new 2-8-2 (Mikado) type locomotives, similar to those constructed for Nigeria and limited to a 13-ton axle load, arrived to ease the traffic problem of the heavily burdened metre-gauge system.

South African Railways and Harbours were still rapidly developing. In the six months ended March 1952 more than 117,000,000 suburban passengers were carried, of whom nearly 50% were in the Johannesburg area and most of the remainder in the Capetown area. The S.A.R. and H. in 1949-50 experienced a difficult financial period, but 1951 ended with a surplus of more than £8,500,000. Construction programs included the widening of the Natal main line, the partial completion of the new Johannesburg passenger station and the electrification of the Bellville-Touws River main line.

South America.—A government decree in Argentina early in the year provided for the inclusion of all government-owned transport within the Empresa Nacional de Transportes, known as E.N.T. or State Transport Undertaking. This embraced not only railways but also air lines and shipping. The British-owned railway companies, nationalized some years earlier, were in the final stages of liquidation. In Brazil electrification of the Central railway out of São Paulo was continued and progress was made on the construction of the Brazil-Bolivia railway. At the beginning of 1952 this line had penetrated to within 110 mi. of Santa Cruz, Bol.; it would finally reach Cochabamba, Bol.

Mexico.—Few countries could claim proportionately greater railway activity in 1952 than Mexico. Nationalization of the hitherto U.S.-owned Southern Pacific Railway of Mexico occurred at the beginning of the year. Reconstruction of about 150 mi. of the Mexico City-Vera Cruz line, formerly known as the Mexican railway, was taken in hand and the new standard gauge Mexico City-Oaxaca line was reported complete early in the year. Most of the 438-mi. standard-gauge Oaxaca-Puebla line was laid with heavy rail.

Canada.—Four major schemes of railway construction continued in Canada: (1) the independent Quebec, North Shore and Labrador line designed to develop the ore resources around Knob Lake—a traffic estimated eventually to reach 20,000,000 tons annually; (2) the 85-mi. extension of the provincially owned Pacific Great Eastern from Quesnel to join the Canadian National railways at Prince Rupert in British Columbia; (3) the C.N.R.'s own branch in the same area from Terrace, near Prince Rupert, to Kitimat, to cost about \$10,000,000, which was linked with a great aluminum development project involving a new port; and (4) the Sherridon-Lynn Lake new 155-mi. branch designed to open up the nickel ore resources at Lynn Lake in northwestern Manitoba.

Other Canadian railway developments in different spheres were the government's approval of the recapitalization of the Canadian National railways, the demolition of that company's historical Bonaventure station at Montreal and the continuing construction of the Toronto subway, the first underground railway in Canada.

Australasia.—Besides a shortage of skilled labour, there was an inadequate supply of good quality locomotive fuel. To over-

come this the Victorian government railways converted certain locomotive types to oil-burning; others were equipped to burn the low-grade brown coal of which there was an abundant supply. Main-line diesels were coming into service. Electrification was continued to ease the fuel problem and the same policy was being extensively adopted in New South Wales. The volume of traffic remained in most states at an almost record level.

The arrival in New South Wales of the new 255-ton Beyer-Garratt 4-8-4 + 4-8-4 steam locomotives being built in Manchester, Eng., was expected to reduce materially the strain on the available motive power resources. These locomotives were reputed to be the heaviest locomotives ever built outside North America for the standard 4 ft. 8.5 in. gauge. In September the New South Wales government announced a complete reorganization of its railway administration involving the abolition of its Transport and Highways commission.

Tasmania benefited from the acquisition of new steam locomotives, limited in axle load to ten tons, and additional motive power, including diesels, eased the traffic problems on the Queensland and West Australian systems. In New Zealand, where the annual railway deficit was more than £1,000,000, electrification and dieselization continued, the former relating to the Hutt Valley line near Wellington. Oil-burning steam locomotives of 4-8-2 (mountain) type were received from Great Britain. (See also ELECTRIC TRANSPORTATION.) (C. E. R. S.)

Rayburn, Sam (1882—), U.S. legislator, was born on Jan. 6 near Kingston, Tenn. A graduate of East Texas State Teachers college, Commerce, Tex., he studied law at the University of Texas, Austin, and began practice at Bonham, Tex. First elected to the U.S. house of representatives as a Democrat from the 4th Texas district in 1912, he took his seat on March 4, 1913; thereafter he served without interruption in the 63rd through 82nd congresses and was re-elected on Nov. 4, 1952, to the 83rd congress (1953-55). He was majority leader of the 75th congress and on Sept. 16, 1940, was elected by acclamation to succeed William B. Bankhead as speaker of the house in the 77th congress. He was re-elected speaker of the 78th and 79th congresses, was minority leader of the 80th, and again speaker of the 81st and 82nd (1949-53). Generally a supporter of the foreign policy of Pres. Franklin D. Roosevelt and Pres. Harry S. Truman, Rayburn was antipathetic to many New Deal and Fair Deal domestic measures.

As permanent chairman of the Democratic national convention at Chicago, Ill., in July 1952, Rayburn played a key role in the dispute over seating delegations from three southern states which refused to take the party "loyalty oath."

Rayon and Other Synthetic Fibres. The break in consumer demand for rayon and acetate fibres which disturbed the industry in the United States during 1951 continued to plague producers far into 1952. In April 1952 the total rayon and acetate production fell precipitously to 79,000,000 lb. from 117,000,000 lb. in Aug. 1951. By Sept. 1952, however, production had increased to 107,000,000 lb. Production of total rayon and acetate fibres utilized 86% of capacity in Sept. 1952 in contrast with only 63% of capacity in April of the same year.

Shipments of all types of rayon and acetate in the latter half

DRYING STOCKINGS over forms at the first German nylon stocking factory, newly opened in a suburb of the western sector of Berlin. The factory operated with 16 U.S. and German-made machines in 1952

of 1952 reflected the general improvement in business conditions in the textile industry. In September, shipments totalled 108,900,000 lb., an increase of 35% over April of the same year and 32% greater than the figure for Sept. 1951. Inventories, which measure production backlog, declined for the sixth month in September as shipments exceeded production in the six-month period. Inventories stood at 70,400,000 lb. at the end of Sept. 1952, substantially less than the all-time high of 119,700,000 lb. recorded in March of the same year.

The general upswing in production of rayon and acetate was no more evenly spread throughout the industry than was the downswing in mid-1951. Regular and intermediate tenacity rayon yarn production amounted to 16,800,000 lb. in Sept. 1952, an increase of 13% over the previous month but still 43% lower than output in August of the previous year. At the same time, output stood at 73% of capacity, the highest for any single month since January, and stocks continued to decline.

The recovery of acetate yarns was more impressive. Until the end of March 1952, output was only 31% of capacity. By September it had soared to 88% of estimated capacity. Third quarter production in 1952 reached 26,000,000 lb. as compared with only 14,000,000 lb. in the second quarter and 13,000,000 lb. in the first quarter.

Acetate staple and tow production declined to 4,400,000 lb. in April 1952, but by September had risen to 9,400,000 lb., or 66% of capacity. It was still, however, 19% below the Aug. 1951 figure of 11,600,000 lb.

A contrasting picture was apparent in the case of viscose high-tenacity yarn and rayon staple and tow, which in large part compensated for the general sluggishness in rayon and acetate production. Viscose high-tenacity yarn production continued at capacity levels, as did rayon staple and tow. However, neither division had been seriously affected by the market recession of mid-1951.

A comparison of United States rayon and acetate production from its earliest recorded statistics to 1952, in ten-year periods, is as follows:

United States Rayon and Acetate Production

	(In millions of pounds)					
	1911	1921	1931	1941	1951	1952 (First 9 mo.)
Filament						
Rayon	0.4	14.9	135.2	287.5	658.1	436.8
Acetate	—	0.1	15.6	163.7	300.1	159.9
Staple and tow						
Rayon	—	—	0.9	105.3	207.3	158.1
Acetate	—	—	—	16.7	128.7	69.8

The production of man-made fibres other than rayon and acetate continued its virtually unbroken upward trend. It was estimated at 124,100,000 lb. in the first half of 1952, as compared with 100,000,000 lb. in the first half of 1951. Production during the second quarter of 1952, however, totalled 60,400,000 lb., a decrease of 5% from the previous record total of 63,700,000 lb. produced in the first quarter of 1952.

Nylon held its position of pre-eminence among man-made fibres other than rayon and acetate. Demand for nylon continued to exceed production because of the increasing variety of uses discovered for nylon. Its chief use in hosiery and important uses in knitted fabrics, otherwise known as warp knit or tricot, and in woven fabrics was supplemented by the utilization of nylon to aid the U.S. defense effort, such as in the development of nylon armoured vests.

Total world production of rayon and acetate in 1952, it was estimated, would total 4,775,280,000 lb. of which 2,481,875,000 lb. was filament yarn and 2,293,405,000 lb. was staple. As compared with 3,957,470,000 lb. produced in 1951 composed of 2,119,400,000 lb. of filament yarn and 1,838,070,000 lb. of staple, 1952 estimates called for an increase of 817,810,000 lb. over 1951 production. United States, the largest rayon and acetate producer in the world, was expected to account for 44% of the filament in 1952, compared with 45% in 1951 and 50% in 1950, and 17% of the staple in 1952, compared with 18% in 1951 and 20% in 1950.

Germany, including east Germany and west Germany, was the world's second largest producer of rayon and acetate. In 1952 west German productive capacity was expected to rise to 445,000,000 lb. East Germany had a 215,000,000-lb. capacity, which placed Germany's estimated production in 1952 at 660,000,000 lb.

United Kingdom production was third in importance, following the United States and Germany. Its output of 369,400,000 lb. in 1951 was expected to rise in 1952 to 450,000,000 lb., an increase of 21.8% for the year. The United Kingdom was closely followed by Italy which had made phenomenal progress in rayon and acetate production since World War II. Italian productive capacity in 1952, it was believed, would rise to 443,000,000 lb., whereas only seven years earlier Italian production amounted to only 7,345,000 lb. France was fifth largest producer with an estimated productive capacity of 293,200,000 lb. in 1952, an increase of 28% over a capacity of 229,075,000 lb. in 1951. (See also TEXTILE INDUSTRY; WOOL.) (I. L. BL.)

Reconstruction Finance Corporation. The Reconstruction Finance Corporation was established by congress Jan. 22, 1932. Since that time its powers and duties have been periodically renewed and amended by the congress to meet changing national needs. The present statute extends its lending powers to June 30, 1954, and the life of the corporation to June 30, 1956. Its capital stock is \$100,000,000 all held by the United States.

Management and Organization.—Management and direction of the RFC is vested in an administrator and a deputy administrator, both appointed by the president, with the advice and consent of the senate. A loan policy board is composed of the following members: the administrator, as chairman; the deputy administrator, as vice-chairman; the secretary of the treasury, the secretary of commerce and the administrator of the Defense Materials Procurement agency. It establishes general policies (particularly with reference to the public interest involved in the granting and denial of applications for financial assistance by the corporation and with reference to the coordination of the functions of the corporation with other activities and problems of the government) which govern the lending operations of the corporation.

The corporation functions through a principal office at Washington, D.C., and loan agencies established in cities throughout the United States.

Functions.—The RFC is authorized by the RFC act, as amended, to make loans to business enterprises (including railroads and air carriers); to make loans to financial institutions; to subscribe for and make loans upon the nonassessable preferred stock of insurance companies and to purchase the legally issued capital notes and debentures thereof; to purchase the securities of and make loans to states, municipalities and other public agencies; and to make loans because of floods or other catastrophes.

Under the RFC act, as amended, the Defense Production act of 1950, as amended, and applicable executive orders and regulations, the corporation also makes loans (including bank participations) to business enterprises for the purpose of financing defense or essential civilian requirements. In addition, the corporation is authorized to purchase securities or to make loans (including participations therein or guarantees thereof) for the purpose of aiding in financing projects for civic defense purposes.

Other functions relate to the production of strategic and critical materials—synthetic rubber, tin and abacá (Manila hemp)—and the liquidation of certain defense plants and facilities.

Operations.—The principal lending activity of the RFC in the fiscal year 1952 consisted of loans to business enterprises (made directly or in participation with banks) for the purpose of aiding the production of goods or services necessary to meet either military requirements or essential civilian requirements. From June 30, 1951, through June 30, 1952, 2,218 applications for such loans, amounting to \$1,341,800,000, were received; and 777 loans were approved in the gross amount of \$329,600,000, including 175 for \$199,496,484 which were authorized under the provisions of section 302 of the Defense Production act of 1950, as amended. Approximately 90% of the total number of loans approved were for \$500,000 or less, and approximately 68% did not exceed \$100,000. In addition, the RFC had outstanding commitments to participate in 2,580 business loans made by banks, totalling \$74,633,000, of which the RFC's share was \$47,812,000. Other loans or purchases of obligations authorized during the fiscal year included 3,055 catastrophe loans aggregating \$21,656,382 and loans to states, municipalities and other public agencies totalling \$27,027,500.

Excluding loans approved under section 302 of the Defense Production act of 1950, as amended, at June 30, 1952, there were 5,794 business loans outstanding in the aggregate amount of \$383,885,261 of which RFC's share was \$365,651,877. In the Defense Production act category there were 101 loans outstanding for \$59,338,499. Loans and investments outstanding at June 30, 1952 (excluding Defense Production act) amounted to \$664,644,286, RFC's share.

Tin, Synthetic Rubber, and Abacá Activities.—The government-owned tin smelter at Texas City, Tex., constructed by the RFC in 1942 as a defense measure, continued in operation. In the 1952 fiscal year the RFC acquired or produced 60,184 long tons of refined tin.

Virtually all facilities for producing general-purpose synthetic rubber, known as GR-S, as well as the plants for the production of butyl, used chiefly in the manufacture of inner tubes, are government-owned and are operated for the account of the RFC. During the 1952 fiscal year, 800,000 long tons of synthetic rubber were produced, and sales amounted to \$416,000,000. As of June 30, 1952, 30 plants were in operation, representing an investment of approximately \$512,000,000.

The four abacá plantations located in Costa Rica, Guatemala, Honduras and Panamá yielded 32,041,250 lb. of fibre; 30,861,900 lb. were sold for a total of \$7,945,231 in fiscal 1952.

Liquidation Activities.—The RFC is required by law to liquidate its national defense, war and reconversion activities carried on through its subsidiaries, the Defense Plant corporation, Metals Reserve company, Rubber Reserve company, Defense Supplies corporation, U.S. Commercial company and War Damage corporation. The RFC is also responsible for liquidating the affairs of the Smaller War Plants corporation and those of the RFC Mortgage company, all the capital stock of the latter having been owned by the RFC.

During fiscal year 1952 the corporation continued the liquidation of assets acquired and liabilities incurred under terminated national defense and wartime programs. At June 30, 1952, there remained for liquidation assets at cost aggregating \$74,431,132, compared with \$89,650,643 at June 30, 1951, a decrease of \$15,219,511.

(H. A. Md.)

Red Cross. **United States.**—Disaster relief activities and services to the armed forces highlighted the work of the American Red Cross in 1952. Disaster relief operations were undertaken to aid sufferers from tornadoes in the south and flood victims in the Missouri and Mississippi river valleys. In these and in 289 other disaster relief operations from July 1951 to July 1952, the Red Cross met emergency needs and gave rehabilitation aid. Total expenditures on disaster relief and preparedness during the fiscal year 1951-52 were \$19,038,529.

With the continuing expansion of the armed forces, the Red Cross endeavored to bring its services to U.S. service men and women stationed throughout the world. Field directors were with the troops in the far east and Europe, on manoeuvres, and at all major military installations, covering smaller stations itinerantly. The extensive volunteer-based program in military hospitals continued, 95 such hospitals in the United States being served on July 1.

Except for increasing emphasis on volunteer work in all branches, Red Cross work in communities remained basically unchanged during the year. On July 1, 156 veterans hospitals were being served by extensive Red Cross volunteer programs. Chapter home service volunteer workers aiding servicemen, veterans and their families had given 1,459,000 hours to their work during 1951-52. There were 1,090,000 first aid certificates awarded as well as 813,000 certificates in the various swimming,

"MATCHBOX GAME" introduced by a Dutch soldier at a party for wounded U.N. troops. They were in a Swedish Red Cross hospital in Pusan, Kor., in 1952, and convalescents of the various nations were teaching each other parlour games popular in their own countries

lifesaving and small-craft handling courses and 255,200 certificates in the home nursing courses. Of all certificates awarded, 39% went to school and college students.

Promoted by a donor campaign undertaken by the U.S. department of defense and hundreds of national and community groups, Red Cross blood collections for defense increased, 2,440,000 pints being procured during the fiscal year. Collections for the civilian program, which supplies community hospitals with blood, continued adequate to meet needs, averaging 140,000 pints a month. A total of 18,500 units (100 c.c.) of serum albumin and 977,100 units (2 c.c.) of immune serum globulin, both blood derivatives important in the treatment of certain diseases, were distributed to state health departments.

In 83,000 schools throughout the country, Junior Red Cross members continued their community service and international understanding activities, the latter including during the year the second experimental project in recording American school music for export to schools overseas. In the 1951-52 school year, junior members packed 623,000 gift boxes for shipment to children in other lands.

On the international scene, the American Red Cross provided emergency and organizational aid to 24 other Red Cross societies, disaster aid to 7 societies, and technical and advisory assistance to 2 societies, as well as co-operating with the United Nations and its specialized agencies. The American Red Cross also participated in the 18th International Red Cross conference at Toronto, Can., in July. American Red Cross representatives helped set up the machinery for prisoner-of-war exchange in Korea, ready for operation when and if an armistice should be concluded; volunteers in the United States packed 11,000 prisoner-of-war food and medical packages that were being held ready in Korea.

(J. G. MA.)

World.—The 18th International Red Cross conference met in Toronto, Can., July 26-August 7, 1952, under the chairmanship of John Alexander MacAulay (Canada), with approximately 600 delegates and observers representing 49 governments, 55 national Red Cross and Red Crescent societies, the International Committee of the Red Cross, the League of Red Cross Societies and 30 international governmental and nongovernmental organizations. It was the largest and most representative gathering of its kind in the history of the Red Cross.

Most of the general debates centred around attacks by Communist governments against the United States for alleged bac-

teriological warfare in Korea and against the I.C.R.C. for alleged lack of impartiality. In March the United States government had invited the I.C.R.C. to investigate such charges and the I.C.R.C. had accepted, provided the North Korean government would permit entry of neutral teams of experts, which it refused. Resolutions finally adopted by the conference included: an appeal to governments to ratify the Geneva Conventions of 1949 (only 19 had done so) and the Geneva protocol of June 17, 1925, prohibiting bacteriological weapons, and to agree, within the framework of general disarmament, to a plan for the international control of atomic energy; an invitation to the governments involved in the Korean conflict to examine charges of alleged violations of the Geneva Conventions on the basis of a common agreement; an appeal to the North Koreans and Chinese to permit the I.C.R.C. to inspect prisoner-of-war camps in North Korea as it had inspected United Nations prisoner-of-war camps in South Korea since the start of the conflict; reaffirmation of the fundamental principles of the Red Cross, *i.e.*, impartiality, political, racial, religious and economic independence, universality of the Red Cross and equal rights of national societies; legal assistance to refugees; mutual assistance in case of national disasters; contributions toward famine relief; standardization of medical equipment; education of youth in the spirit of international fraternity, solidarity and the maintenance of peace.

Revised statutes of the International Red Cross and regulations of the International Red Cross conference, proposed by a subcommission of the Standing Commission of the International Red Cross after a two-year study, were adopted by a majority vote over opposition of the Communist bloc, which would have shorn the I.C.R.C. of its authority as a neutral intermediary. Political debates in future International Red Cross conferences were prohibited under the new regulations.

An invitation from the Indian Red Cross to hold the 19th International Red Cross conference in New Delhi in 1956 was accepted.

Elected as new members to the League of Red Cross Societies were the Red Cross societies of Ceylon, San Marino and the Federal Republic of Germany, bringing total league membership to 71 national societies, grouping more than 100,000,000 individual members.

In his report, the secretary general of the league, Count Bonabes de Rouge, stated that mutual assistance between national societies during the preceding two years was valued at \$10,000,000.

Refugees. The liquidation of the International Refugee organization in the early months of 1952 signalled the end of mass movements of refugees out of Europe. During its lifetime of 4½ years of service to refugees in Europe the organization, a specialized agency of the United Nations, had provided care and maintenance for more than 1,000,000 refugees in camps in Europe, repatriated 72,834 to their countries of origin (chiefly in eastern Europe) and had moved 1,038,750 in resettlement to Argentina, Australia, Brazil, Canada, Chile, the United States, Venezuela and other countries. Eighteen member governments—Australia, Belgium, Canada, China, Denmark, the Dominican Republic, France, Guatemala, Iceland, Italy, Luxembourg, the Netherlands, Norway, New Zealand, Switzerland, the United Kingdom, the United States and Venezuela—had contributed \$406,867,295 to these efforts.

On terminating its operations on Jan. 31, 1952, the organization turned over 12,205 refugees for movement to the Provi-

ional Intergovernmental Committee for the Movement of Migrants from Europe, which had been organized at a conference on migration convened by the government of Belgium at Brussels in Nov.-Dec. 1951. This committee, starting with a membership of 15 governments, undertook the task of moving migrants from overpopulated countries in Europe and refugees to countries of immigration overseas. Capitalizing on the experience developed by the International Refugee organization and utilizing its ships and trained personnel, the committee maintained the previous volume of monthly movement out of Europe until July 1952, when changes in the immigration policies of the main receiving countries—Australia, Canada and the United States—resulted in a reduction in the flow of migrants out of Europe.

Contributing to this development was the final expiration of the United States Displaced Persons act of 1948, amended in 1950 and 1951, under which more than 340,000 refugees and displaced persons had been admitted from Europe to the United States. In Australia the development of unemployment and the reduction of government expenditures were accompanied in June by a cabinet decision to reduce the original quota of immigration for 1952 from 160,000 to 80,000. Canada likewise reduced its intake of immigrants for economic and political reasons.

In spite of these developments the Migration committee had succeeded by Sept. 1952 in moving 62,808 persons out of Europe. Included in this figure were 23,876 refugees. It was anticipated at the fourth session of the committee held in Geneva in October that more than 100,000 migrants and refugees would be moved out of Europe by the end of the year.

The committee was provisionally organized to conduct movement for one year in order to test the form of organization, its method of financing and the need for its services. At its fourth session the membership had grown to 21 governments—Australia, Austria, Belgium, Bolivia, Brazil, Canada, Chile, Denmark, France, Germany, Greece, Israel, Italy, Luxembourg, the Netherlands, Norway, Paraguay, Sweden, Switzerland, the United States and Venezuela. A unanimous decision was reached to continue the activities of the committee during 1953 and to expand its services closely related to the movement of migrants as provided in the resolution adopted at Brussels in 1951. The name of the committee was changed to the Intergovernmental Committee for European Migration.

Of the 62,808 migrants moved between Feb. 1 and Sept. 30, 1952, 34,578 came from Germany, 10,375 from Austria, 7,451 from the Netherlands, 6,011 from Italy, 753 from Trieste, 126 from Greece, 600 from the far east and 2,914 from other countries. The United States received 36,618 of the total, chiefly ethnic Germans from Germany and Austria; Australia, 10,702; Canada, 7,295; Brazil, 5,365; Venezuela, 627; Chile, 563; and Israel, 264. Hugh Gibson of the United States was elected director of the committee at its session in Washington in July 1952.

In Aug. 1952 Pres. Harry S. Truman appointed a six-man commission to study and review proposals for immigration legislation and to report its findings to him by Jan. 1, 1953. The McCarran-Walter act adopted by the congress in the spring of 1952, which codified existing United States immigration laws and retained the principle of national origins as a basis for establishing annual quotas of immigrants admissible to the United States, came under severe criticism during the presidential campaign in the fall of 1952 on the grounds that it discriminated against certain classes of immigrants and failed to give expression to United States interests in the problems of overpopulation and refugees in Europe because of its over-all restrictive features.

The office of the United Nations high commissioner for refugees was established at Geneva by the general assembly of the

United Nations on Dec. 14, 1950. G. J. van Heuven Goedhart, the Netherlands, was elected high commissioner for a three-year term. This office took over from the International Refugee organization the function of providing international legal protection for refugees until they acquire a new nationality. The office was also charged with the task of finding final solutions for the problems of refugees.

The general assembly of the United Nations at its sixth session in Paris in Jan. 1952 voted a budget for the office of \$718,000 for 1952 and adopted resolution 538B(VI) which authorized the high commissioner to appeal for \$3,000,000 in funds for the emergency relief of refugees under his mandate.

The high commissioner reported on Nov. 19, 1952, that he had received contributions and pledges totalling \$760,000 to the refugee emergency fund and had allocated all the funds received. The sum of \$650,000 had been spent or allocated for the needs of 4,500 refugees among the 7,500 European refugees still seeking opportunities for emigration from Shanghai. The balance had been allocated to meet the needs of refugees in Austria, Belgium, Germany, Greece, Italy and the near east.

Apart from the refugee emergency fund, the Ford foundation made a grant of \$2,900,000 in Aug. 1952 to be administered by the high commissioner to assist the integration and establishment of refugees in their countries of residence. Emphasis was to be placed in the use of the fund on efforts to assist the assimilation of refugees through youth educational and cultural activities. No restrictions were placed on the categories of refugees to be benefited by the fund.

The flow of German refugees from east Germany to west Germany through Berlin continued during 1952 at a rate of 15,000 monthly. A total of 250,000 had arrived in Berlin in 1951. This constant influx intensified the serious problems of unemployment and housing in western Germany. During the height of the movement in midyear, emergency efforts to absorb the refugees in western Germany failed to keep pace with the influx into Berlin.

The numbers of eastern European refugees entering Austria, Germany, Greece, Italy, Turkey and Trieste were smaller during 1952 than in previous years, because of tighter controls placed on the borders by the eastern European countries. On March 22, 1952, President Truman announced the initiation of a new effort of the United States government to assist these refugees under the provisions of the Mutual Security act of 1951. The stated objectives of the program, to be administered by the department of state, were to establish better facilities of reception for these refugees in the countries of first asylum, to supplement the care and maintenance already provided by those countries and by voluntary agencies, and to assist the new refugees either to emigrate abroad or to re-establish themselves in Europe.

United Nations efforts to resolve the problem of approximately 875,000 Arab refugees in Lebanon, Jordan, Syria, Gaza and Israel, resulting from the conflict in Palestine in 1948, continued during 1952. Emphasis continued to be given to the gradual reduction of direct relief expenditures in favour of the progressive development of projects which would result in the permanent integration of the refugees into the communities in which they might be settled. (See also IMMIGRATION AND EMIGRATION.)

Religion. World meetings of several confessions were held during 1952. The Disciples fourth world gathering met in Melbourne, Austr.; the Lutherans sent 5,000 delegates to their World Federation at Hanover, Ger.; the Mennonites met in Basle, Switz.; the Quakers in Oxford, Eng.; and the Roman Catholics held their first International Eucharistic congress since World War II in Barcelona, Sp.

In China, Communists confiscated Confucian, Buddhist and Taoist temples, ousting priests. Mohammedans and Christians suffered in lesser proportions. With the elimination of foreign missionaries, some of whom were killed and many of whom were imprisoned, the persons most persecuted were those closely identified with them. Chinese independent churches were not seriously molested. Some thought that this was an indication of political rather than religious motives for the antireligious movement. Although greatly reduced, the Christians, both Catholic and non-Catholic, continued to carry on worship.

Accelerated widespread persecution of the clergy and laity wherever communism prevailed showed a pattern suggesting eventual nationalization of the church in "iron curtain" lands. Within Roman Catholic areas behind the curtain, 11,000 priests and 50,000,000 members were listed with 89 out of 284 sees vacant through imprisonment, expulsion or death of former incumbents.

In India, popular attention shifted from religion to social and economic problems. Indian churches showed increased concern for missions in neighbouring lands, the North India United Church promoting work in East Africa and the South India United Church enlarging its work in Papua. The Mar Toma Church planned to work in Nepal. Native states formerly closed were opened to missionary effort; but the rush of missionaries disturbed the government and a temporary stay in the granting of visas resulted.

In Korea, church work continued and large numbers of Communists, both Korean and Chinese, accepted Christianity and held vast dawn prayer meetings in Koje and other prison camps. Thus appeared the most significant movement anywhere of Communists toward Christianity. It underscored the desires of converts not to be returned to Communist hands.

In the Philippines, Trinitarians won a court appeal. Their bishop was declared legitimate supreme head of the largest native church, formerly Roman Catholic and later Unitarian.

In Australia a six-month Christian mission led by Methodists but also open to others was begun in September.

The United Nations high commissioner for refugees received a large grant from the Ford foundation and allocated it to religious agencies—the Jewish Joint Distribution committee, the Friends Service committee, the National Catholic Welfare conference and the World Council of Churches. Most of these had long been resettling refugees and had cared for many hundreds of thousands through church and synagogue activity.

During the German Catholic congress in Berlin, attended by 200,000, the Evangelical bishop, Otto Dibelius, welcomed the Roman archbishop of Munich to his home and opened the largest Protestant churches when Communist officials refused use of public halls. The final Berlin gathering met in the Olympic stadium and applauded Pastor Kreysing, Evangelical leader, when he declared that it was not mere accident that Catholics and Protestants had met under the shadow of the same 80-ft. cross that had been erected for the 1951 Berlin *Kirchentag* which rallied more than 300,000 Protestants. In the Saxony Bautzen cathedral, Catholics and Protestants both worshipped regularly.

This was in pleasing contrast to the attacks upon Protestants

by Catholic leaders in Spain. An outburst in Italy against Evangelicals was quickly ended but the "Osservatore Romano" subsequently officially reiterated a repudiation of religious freedom in Italy and claimed benefit of the discriminatory clauses of the "Lateran treaty."

The Turkish government granted permission to the nation's Jews to elect a new chief rabbi, reversing an 18-year ban.

An important study featured the North American Assembly on African Affairs at Wittenberg college, Springfield, O., under the auspices of the National Council of Churches. Many government officials as well as church representatives attended and joined in recommendations for improving conditions of the African peoples.

A survey of the distribution of missionaries from North America showed that of the 15,000 in service, an all-time high, 25% were in Africa, 25% in Latin America, 21% in east Asia, 14% in India, Ceylon and Pakistan, 7% in southeast Asia, 5% in the near east and 3% in the Pacific Islands. There were 5,000 Roman Catholic missionaries from the U.S.

Church membership in the U.S. continued to climb to all-time highs, both in actual numbers and in percentage ratio, which reached 62% of the population.

In New York state the Board of Regents, convinced of "the fundamental American belief in and dependence upon God," argued for the use of prayer in its public schools, and specified the text of a prayer approved by Protestants, Roman Catholics and Jews, *i.e.*, "Almighty God, we acknowledge our dependence upon Thee, and we beg Thy blessings upon us, our parents, our teachers and our country."

The United Church of Canada launched a radio mission similar to one conducted by the Church of Scotland. It began in September and was to continue for eight months. The Scottish assembly approved as religiously right the principle that the mother's life is more important than that of an unborn child.

The Scandinavian diaconate staffed a civilian hospital in Korea. Wide use of the film "King of Kings" was reported from Korea, where the interest of people in Christianity was at an all-time high.

In September the mothers general of religious orders for women met at Rome for an unprecedented re-examination of their discipline, procedure, dress and function. The Vatican's international commission on immigration under James Norris, a U.S. layman, revealed the grave concern of Catholics over immigration as a solution to Europe's tensions.

Pope Pius XII urged a world-wide Catholic crusade for return to Christ, and set up an organizational structure to initiate the movement.

Religious Education. Protestant and Orthodox.—In Feb. 1952, the United Christian youth movement in the United States reached the climax of its plans for what it termed "the Call." One of the goals was the enrolment of 1,000,000 young people in deeper Christian consecration. Although the goals were not achieved, it was declared that the favourable influence for interdenominational youth work in hundreds of local communities would be felt for many years to come.

The board of managers of the World Council of Christian Education and Sunday School association met in London, Eng., in July. Among the numerous matters considered were the reports of the two administrative committees.

RALLY in Washington, D.C., celebrating completion of the Revised Standard Version of the Holy Bible (R.S.V.), a new translation authorized by 40 Protestant and Eastern Orthodox denominations and published in 1952

The secretary of the British administrative committee had spent three months in India studying the situation in respect to the India Sunday School union and seeking to enlist added interest and support from the churches for the union.

The North American administrative committee reported that it had adopted a program for the years 1952-56. The stated purposes were as follows: (1) To aid in deepening and widening the concern of the principal Christian leaders for effective Christian education for children, for young people and for adults; (2) to stimulate and aid in the establishment of such nation-wide denominational and interdenominational organizations as were needed; (3) to aid the denominational and interdenominational organizations and leaders serving each country in their major tasks of Christian education; (4) to unite these denominational and interdenominational leaders in Christian education in world-wide fellowship, to encourage and enable them to draw from and contribute to that fellowship the fullest measure of inspiration and help, and always to see their individual responsibilities as part of the world-wide enterprise of education in the Christian faith and life. Six aspects and emphases were listed: (1) The foundations of Christian education; (2) the Christian education of all age groups; (3) Christian education in all institutions, including the church, the Christian home and the Christian school; (4) the preparation of suitable curriculum materials; (5) the development of adequate programs to prepare persons for service in Christian education; (6) education in the ecumenical ideal. Six channels of service were named: Publications, regional and world meetings, field visitation, correspondence, financial grants, and other organizations.

One of the most tangible and popular services which this council had under way was known as "Pictures for Children Everywhere." Thousands of Sunday schools and other agencies of Christian education had no Bible pictures at all. Through the efforts of denominational leaders of children's work in the United States and Canada, money was collected from children for purchasing pictures to send abroad. The World Council of

Christian Education was thus enabled to distribute more than 527,000 coloured Old and New Testament pictures for classroom use and more than 3,700,000 small pictures for the children. These were sent to more than 81 countries. (F. L. KP.)

Roman Catholic.—In 1952 there were 8,358 elementary parochial schools instructing 2,692,706 children, and 531 private elementary schools taught 84,151. The enrolments in 1,623 parish and diocesan high schools numbered 353,465, while 818 private high schools taught 205,025 pupils. 8,962 seminarians attended 73 diocesan seminaries, and 5,159 diocesan students studied at other seminaries. 351 religious-order seminaries or scholasticates had a student body of 16,867. There were 204,937 students in Catholic colleges and universities.

Sixteen Catholic school systems and 47 Catholic colleges or universities filed letters of intent with the Federal Communications commission for use of one of the 242 television stations assigned for noncommercial purposes.

Archbishop Joseph E. Ritter of St. Louis was elected the new president general of the National Catholic Educational association at the annual convention held in Kansas City, Mo. The theme of the convention was "Catholic Education and the American Community." Resolutions adopted at the convention stressed the following points: (1) Recent events have sharpened the community's awareness that all its activities, social, economic and political, should be guided by moral principles, the knowledge and practices of which must be developed in youth. (2) A community which understands its democratic heritage must recognize in its traditions an educational diversity that has fostered in our culture a living unity and not a dead uniformity. (3) Catholic schools should strengthen their desire to know and to meet the concrete needs of the community and fully to prepare themselves for the rapidly expanding school population.

The National Council of Catholic Men inaugurated a film information service to review and catalogue all 16-mm. religious films suitable for Catholic use in parishes and schools or on television. (J. LAF.)

Jewish.—The annual reports of the Jewish educational institutions in the U.S. indicated increased registration. Whether this represented heightened interest in Jewish values or was merely

the result of the growth in population was an unanswered question. Improved textbooks and educational aids continued to be produced in quantity for elementary and intermediary schools. The establishment of a new department of audio-visual aids by the Union of American Hebrew Congregations was an instance of such progress. Similarly, the number of all-day schools had multiplied and enrolment had increased.

A venture of great promise was that which the liberal wing of Jewry initiated at their newly acquired camp on Lac La Belle, Oconomowoc, Wis. Groups of youngsters and, at different times, older persons were afforded the opportunity of a week or two weeks' visit to the camp. A program of physical recreation, Jewish education and periods of worship and silent meditation was available. The adult program was not confined to the summer only, but included week-end retreats throughout the year.

In Israel, the concern for proper education of the children of new and old settlers continued to be of importance, equal to the problems of providing an adequate food supply for the growing population and the plan to irrigate the Negev. The compulsory education law had been accepted by even the Arab minority: 27,000 Arab children were enrolled in government schools and about 4,500 in mission schools. The increased attendance in public schools had overtaken the availability of quarters and teachers. (See also EDUCATION; LAW.) (B. H.)

Remón, José Antonio (1908–), Panamanian political leader, was born on June 1. Entering politics at an early age, he became national chief of police and by 1949 was the "strong man" of Panamá. In that year he forced the resignation of Pres. Daniel Chánis, Jr., despite a decision by the nation's supreme court affirming Chánis' legal right to the office. Again on May 10, 1951, Remón overthrew the administration of Arnulfo Arias Madrid and installed Alcibiades Arosemena in the presidency. In 1951 Remón himself campaigned for the presidency as the candidate of a national five-party coalition. In elections held May 11, 1952, Remón was elected by a large majority, receiving the largest number of votes in the nation's history. He took office as president on Oct. 1, 1952, for a four-year term.

Rent Stabilization, Office of. Extension of federal rent ceilings and protections against unjust evictions to approximately 150 critical defense housing areas in 45 states and Alaska, in addition to normal housing areas already under control, proved the principal development in the war against inflation on the rental front in the United States during 1952.

In the critical areas, rent levels applied to every type of housing rented for shelter, while in the normal or limited areas, hotels, motels, trailer courts and housing constructed or converted for rental after Feb. 1, 1947, were exempt. Approximately 5,500,000 people were living in controlled units in the critical areas and 13,800,000 people in controlled units in the normal areas.

The federal program, administered by the Office of Rent Stabilization, was in effect in every state except New York (which had its own rent control program) and in Alaska and Puerto Rico.

The critical areas were jointly certified as such by the secretary of defense and the director of the Office of Defense Mobilization after the federal Critical Areas Advisory committee decided a substantial influx of servicemen or defense workers into each locality had caused acute housing shortages and sharp rent increases.

James McInness Henderson became director of the Office of Rent Stabilization on Sept. 1, 1952. Two months before Hender-

son took office, the 82nd congress amended the Housing and Rent act to require local governing bodies in the normal or limited rental areas to decide by Sept. 30 whether they wished the federal rent program continued until April 30, 1953. Federal rent levels and eviction protections were to end on Oct. 1 in all normal or limited localities failing to request continuance. The program was to continue until April 30 in all critical areas then in existence and all critical areas to be created in the future.

Of 116 cities in continental United States of more than 50,000 population already under federal rent stabilization, 71 asked continuance. The rent program remained in such major cities as Chicago, Philadelphia, Pittsburgh, Boston, St. Louis, Newark, Jersey City, Camden, Cincinnati, Cleveland, St. Paul, Minneapolis, Duluth, Memphis and San Francisco.

Congress also removed the power of local governing bodies to re-control themselves, and it provided for public hearings conducted by the Office of Rent Stabilization in newly certified critical areas which had previously been decontrolled by action of the local governing body.

The membership of rent advisory boards, made up of unpaid residents in each controlled area who had volunteered their services, rose to 2,790 during the year. The number of active rent advisory boards reached 433 with 143 being located in critical and 290 in normal areas. The rent advisory boards gave equal representation to landlords and to tenants but the balance of power numerically was always held by members who represented the general public. All were appointed by the Office of Rent Stabilization from nominees suggested by the governors of the various states.

Landlords or tenants dissatisfied with area rent office decisions on individual rentals could ask their rent advisory board for a review. In addition, the rent advisory boards had the power to recommend any changes needed in the rent program in their localities, as well as to recommend decontrol of all or part of the rental units included in the program. Respiratory Diseases. The machinery set up by the World Health organization to study and cope with influenza epidemics had worked quite effectively. Epidemics wherever they occurred and were studied during 1952 were caused by a strain of virus that was closely related to the type B influenza virus. The year saw the first widespread epidemic of influenza B infection since 1945-46. This epidemic was not a serious one by the usual standards of influenza epidemics, at least with respect to mortality, and the morbidity rates were relatively low as pandemics go.

In the treatment of pneumonia with antibiotics, a number of studies were designed primarily to evaluate the relative effectiveness of the antibiotics which were generally available. Some of the studies were carried out under the auspices of the Medical Research council of Great Britain and others were conducted in the United States. The British were interested primarily in determining whether the so-called broad-spectrum antibiotics, namely aureomycin and chloramphenicol (Chloromycetin), are really sufficiently advantageous compared with what they termed the "standard" treatment, that is, penicillin and the sulfa drugs, to warrant the general use of the former in preference to the latter.

The broad-spectrum antibiotics are probably more expensive to produce than penicillin, and the sulfa drugs relatively are much cheaper. The great difficulty for the British, however, was not out of the fact that, whereas the patent rights for the drugs are held by United States manufacturers and must, therefore, be paid for in dollars which the British do not have, the Americans have no such problem with penicillin and the sulfa drugs since they can produce competitively. The U.S. investigators were interested, in part, in determining the relative efficacy of the different drugs. However, they also set out to determine whether much smaller doses of the broad-spectrum antibiotics than those generally employed would prove equally effective and would thus be more economical and perhaps produce less of the undesirable toxic effects.

The consensus seemed to indicate that penicillin is as effective for the great majority of cases of pneumonia as aureomycin or chloramphenicol. The British workers, who used relatively larger doses of the more expensive agents, found the cost of the average case to be about ten times as high for aureomycin and nine times as high for chloramphenicol as when penicillin was used. The U.S. investigators used about one-fourth to one-fifth as much aureomycin and chloramphenicol as did the British and obtained comparable beneficial effects, so that the differences in cost were not so striking. Moreover, the British found that the large doses of aureomycin and chloramphenicol which they used produced toxic effects more frequently and of greater severity than did the penicillin. The U.S. physicians, on the other hand, found that the toxic effects from the small effective dose which they employed were infrequent and of little importance.

In the British studies the sulfa drugs could not be evaluated since the collaborating physicians chose to use them so infrequently that there were not enough cases for comparison; they obviously preferred penicillin for their "standard" or "control" therapy. Moreover, the British study was not sufficiently extensive to produce a complete answer; the great majority of their cases were pneumococcal pneumonias which could be expected to respond equally well to all of the drugs they were testing. The study did not include a sufficient number of pneumonias arising from organisms which had been found to respond only to the broad-spectrum antibiotics and on which penicillin and the sulfa drugs are generally conceded to produce no beneficial effect. Indeed, the data in all of the studies were insufficient to give as any indication of the relative value of the various drugs with respect to pneumonias other than the most common ones, namely, those caused by the pneumococcus.

There were no developments of major significance in the field of nonbacterial ("viral") pneumonias. The status of the antibiotic treatment of cases of primary atypical pneumonia, which constitutes the bulk of the nonbacterial pneumonias, was brought up to date in a critical review. While uniformly favourable results were reported from large general hospitals in which the experience was primarily with patients of moderate or greater severity, a few reports, some of them in so-called "controlled" series, suggested that antibiotics were not having any significant effect on the course of this disease. Careful scrutiny of these reports indicated that the difficulty arose from the fact that mild cases, which are difficult to differentiate from the common colds or similar common upper respiratory tract infections, were involved in those groups of cases where the results are difficult to interpret. In cases of moderate or greater severity, the best evidence indicated that aureomycin is highly effective in primary atypical pneumonia and that terramycin is equally effective.

No sulfonamide or antibiotic agent thus far used or tested had any influence of importance on influenza, the common cold

and other simple, acute respiratory diseases. The importance of this group of infections lies in the fact that they predispose to serious pneumonias.

More cases of Q fever were constantly being recognized, particularly throughout European countries, and the disease was also being recognized in many new areas where it had not previously been known. There were several reports of the treatment of small numbers of cases of Q fever with aureomycin and terramycin, all of which indicated favourable responses. The results of the largest group to be studied carefully, the one from California, indicated that there was a small residual of cases of Q fever in which continued treatment even with large doses failed to bring about termination of the acute disease, and fever and even the presence of the invading rickettsia in the blood could still be demonstrated in spite of this therapy.

During the year a new and promising antibiotic, called erythromycin, was introduced by the workers in the Lilly Research laboratories under the trade name "Ilotycin." This antibiotic was highly effective, in test tube experiments, against a variety of bacteria which may cause pneumonia, notably the pneumococcus, the hemolytic streptococcus and the staphylococcus; it was moderately effective against some other bacteria, like diphtheria bacillus and the influenza bacillus and the causative organism of whooping cough; but it was essentially without effect against a large variety of other bacteria, particularly those involved in infections of the gastrointestinal or urinary tract. On the whole, the activity of this drug was very similar to that of penicillin rather than that of aureomycin or terramycin. The discoverers also claimed that it was effective against rickettsias and against some viruslike organisms such as those which cause psittacosis; just how effective it would prove to be against these nonbacterial micro-organisms remained to be determined.

The effectiveness of erythromycin against the staphylococcus in the test tube was of particular interest, since strains of this organism which had been isolated in many hospitals had proved quite resistant to penicillin and often to all other available drugs. Resistant staphylococci were also being encountered with increasing frequency as the cause of complicating infections in patients who had been treated, apparently with success, for infections caused by other organisms, such as the pneumococcal and urinary tract infections.

The importance of the staphylococcus as a potentially serious complicating factor in pneumonia caused by other organisms was well illustrated in two series of cases reported from the Boston City hospital in which a broad-spectrum antibiotic, terramycin, was used. In a series of 91 patients with pneumonia treated at that hospital, the bacteriological results and the immediate clinical effects indicated that terramycin was highly effective against pneumococcal pneumonia. In most of the other pneumonias in which the etiology was proved or suspected and in some cases of primary atypical pneumonia, the immediate effects of terramycin therapy were also favourable. However, the replacement of the flora of the sputum by staphylococci and the slow clearing of the lungs and the recurrence and persistence of other evidences of infection indicated that the beneficial effects of terramycin were in part vitiated in many of these patients by superinfections with the staphylococcus. A similar experience was reported from that hospital in a second series of patients treated with terramycin for urinary tract infections in which staphylococci were not often originally involved, but might invade the lungs during terramycin therapy.

Diarrhoea resulting from the terramycin occurred frequently and in many patients was quite severe. In many of the patients with terramycin-induced diarrhoea, the bacteria in the bowels were replaced by pathogenic staphylococci, and these staphylococcal infections of the gastrointestinal tract added considerably

to the morbidity of the patients who recovered. In five of the seven pneumonia patients who died, the toxic effect of the terramycin on the gastrointestinal tract may have contributed in a large measure to the fatal outcome, and staphylococci played an important role in the lungs of four of these patients. Moreover, in an extensive survey of staphylococci at the Boston City hospital, it was shown that the incidence of staphylococci that are sensitive to the available agents had been steadily decreasing.

For these reasons the new antibiotic, erythromycin, seemed worthy of study. The results of some experiences with the use of erythromycin in the treatment of small numbers of patients with various infections had already been published. These reports indicated that in patients with pneumonia or hemolytic streptococcal sore throats, the effects were dramatic and comparable in every respect with those obtained with penicillin or aureomycin. The bacteria, however, persisted somewhat longer with erythromycin than with penicillin. In the treatment of staphylococcal infections, the results unfortunately were not uniformly favourable. The failures in two serious cases of infection of the heart valve with staphylococcus were shown to be due to the fact that the bacteria became resistant to the antibiotic during treatment. In infections of the heart valves with streptococcus, there were failures that were likewise shown to be due to the development of resistance by the streptococci to erythromycin during treatment with that agent.

Erythromycin was well tolerated by patients and serious side effects had not yet been observed. What the ultimate place of erythromycin would be in the treatment of pneumonia or other infectious diseases remained to be determined by the results of further experience.

Réunion. This island in the Indian ocean about 420 mi. E. of Madagascar is a French overseas *département*. Area: 970 sq.mi. Pop.: (1946 census) 242,067 (97% French subjects); (1951 est.) 258,000. The inhabitants are mainly coloured (French creoles, Negroes, mulattoes, Indians and Chinese). Language: creole French. Religion: mainly Roman Catholic. Chief towns (pop., 1950 est.): Saint-Denis (cap., 39,057); Saint-Paul (27,585); Saint-Pierre (24,652); Saint-Louis (23,925). Prefect in 1952: Pierre Philippe.

History.—After Réunion became a *département* in 1946, most of its affairs were dealt with in Paris. This gave rise to delays, against which the general council made a protest by refusing to sit for a time during 1952.

It was decided that planters and factory owners should henceforth meet in a consultative commission on agriculture, which would propose prices while the sugar-cane industry was being revived. The 13 sugar factories, each of which had its own distillery, were financed by the local banks. The price at which the island's sugar could be sold in France was still higher than that of beet sugar. Réunion consumed 20,000 hl. of rum and exported 60,000 hl.

A cold storage plant for fish was opened at the port by the Société de Pêche Malgache et Réunionnaise.

Education.—Nearly all children of school age go to school. There are two lycées.

Finance and Foreign Trade.—(1951) Imports 5,808,000,000 fr. C. F. A. (incl. 5,100,000,000 fr. C. F. A. from the French union); exports 4,500,000,000 fr. C. F. A. (incl. 4,300,000,000 fr. C. F. A. to the French union), mainly sugar (3,150,000,000 fr. C. F. A.), vegetable oils (77,000,000 fr. C. F. A.), rum (500,000,000 fr. C. F. A.). Monetary unit: franc C. F. A. (Colonies Françaises d'Afrique)=2 metropolitan francs. U.S. \$1=350 metropolitan francs. (Hu. De.)

Rhee, Syngman (1875–), Korean political leader. He was born on April 26 in Whanghai province, Korea. He received a classical Chinese education and then enrolled in a Methodist mission school in Seoul. Attracted to the ideals of democracy, he joined an independence club in 18

SYNGMAN RHEE delivering his inauguration address in Seoul, Aug. 15, 1948, after the first presidential election by popular vote in the Republic of South Korea. At left are Mrs. Mark Clark and Mrs. Rhee (holding umbrella). Gen. Mark Clark (foreground)

and founded the *Independent*, Korea's first daily newspaper. In 1897 he led a mass demonstration of students against the Japanese, was arrested and sentenced to life imprisonment, but was freed in a general amnesty in 1904. Meanwhile he had become a Christian convert and while in prison had written a book, *Spirit of Independence*. He went to the United States, studied at Harvard and Princeton, and returned to Korea in 1910 to organize resistance to the Japanese occupation. Discovered, he fled to Hawaii where he directed the Korean Christian institute until 1939. On March 1, 1919, a group of Korean patriots he signed a declaration of independence, set up an exile government in Shanghai, China, and elected Rhee president. He was regularly re-elected until 1941.

To win U.S. recognition of Korean independence claims, he went to Washington, D.C., during World War II. In 1945 he returned to Korea and was elected first president of the Republic of Korea July 20, 1948.

Rhee was the centre of a political storm with repercussions

the United States during 1952 when he clashed with his opinion in the national assembly over presidential election procedures. After he had declared martial law and arrested 12 of his opponents in the assembly late in May, President Truman sent him a message of protest. The dispute was settled on July 4 when Rhee agreed to hold a popular election and establish a unicameral legislature. He was re-elected Aug. 5 by an approximate 3-to-1 margin, and was inaugurated on Aug. 15 for a second four-year term.

Rheumatic Diseases. A significant decline in the incidence of infectious arthritis had occurred during the past decade. This was attributed to the generally effective use of antibiotics or chemotherapy to prevent and quickly suppress systemic infections, following which most instances of infectious arthritis occur as a complication. When encountered, supplemental appropriate antibiotic therapy usually promptly suppresses the arthritis caused by joint infection. Sometimes intra-articular installation of antibiotics aids markedly. During 1952, tuberculous infection of the joint, although benefited significantly by streptomycin, was more effectively suppressed by the combined use of one of the isonicotinic acid preparations. The latter alone was effective in some cases.

Among the forms of rheumatism, the greatest challenges to the patient, the physician and the investigator continued to be rheumatoid arthritis, osteoarthritis and rheumatic fever. Additional reports gave further support to the belief that cortisone and corticotropin (ACTH) as treatment for these illnesses were of limited usefulness. Prolonged use of these hormones in patients with rheumatoid arthritis failed to cure the disease, and little benefit resulted from the temporary suppression of activity of the disease and in palliation of symptoms. In properly selected instances, however, the use of cortisone for these purposes seemed wise. Routine use of cortisone for patients with rheumatoid arthritis was not considered wise because of therapeutic limitations and the potential complications arising from the nonantirheumatic effects of the hormone. Although improvements in prolonged-acting preparations of corticotropin were made during the year, the treatment of a chronic illness with this hormone was considered less practical than with an orally administered hormone.

Although often helpful in relieving pain in patients with osteoarthritis, cortisone or corticotropin used systemically were considered generally unsatisfactory.

An interesting development concerning treatment of rheumatic fever was the preliminary report of a co-operative study by a committee of investigators from Great Britain, Canada and the United States which indicated that, as the study was conducted (no individualization of treatment), results were essentially the same with salicylates, cortisone and corticotropin.

It was believed that a longer time for observation and some special studies would be needed before final evaluation of these forms of treatment for rheumatic fever could be made.

Patients with one of the diffuse collagen diseases, which include diffuse lupus erythematosus, polyarteritis such as pericarditis nodosa, scleroderma and angioneurodermatomyositis, had a much better prognosis since cortisone and corticotropin became available. As a group these illnesses could be well controlled and, although not cured, many patients were kept comfortable and their lives were prolonged by these hormones. Much progress was made in the diagnosis of diffuse lupus erythematosus by employment of the "L. E. phenomenon," by means of which recognition of the disease was made more certain by demonstration of a particular type of alteration of

cells in blood or bone marrow.

The use of hydrocortisone (the free alcohol, not the acetate salt) was studied in patients with rheumatoid arthritis, and preliminary reports suggested that this steroid had greater antirheumatic effects in proportion to other properties, so that smaller doses would suffice and fewer complications develop. Continued use of hydrocortisone acetate injected intra-articularly indicated that in well-selected cases this form of treatment was practical.

As a group, the patients with osteoarthritis were seldom helped sufficiently by intra-articular injections of hydrocortisone acetate to make this treatment practical.

A new drug, phenylbutazone (Butazolidin®) was found to possess excellent analgesic properties in patients with a variety of rheumatic disorders. It was particularly beneficial in aborting attacks of gouty arthritis and acute gouty and nongouty bursitis. In these conditions phenylbutazone had an anti-inflammatory effect; in other (usually chronic) rheumatic illnesses, such as rheumatoid arthritis or osteoarthritis, the only effect it was known to possess was that of analgesic. In many instances analgesia was greater from phenylbutazone than from other nonnarcotic, and nonhormone, drugs. Even though phenylbutazone might cause some undesired effects which would limit its general usefulness, it was believed that with careful supervision it might be a valuable additional treatment for various forms of rheumatism.

Rhode Island. A north Atlantic state of the United States, in New England, Rhode Island was one of the 13 original states; it is popularly known as "Little Rhody." Area: 1,214 sq.mi. (smallest of the United States), including 157 sq.mi. of water. Pop. (1950 census): 791,896, a gain of 11% since 1940. The principal cities, with 1950 populations, were: Providence (cap., 248,674); Pawtucket (81,436); Cranston (55,060); Woonsocket (50,211); Warwick (43,028); Newport (37,564); Central Falls (23,550).

History.—At its 1952 session the legislature enacted the following leading measures: an act appropriating \$48,842,002.68 for the support of the government for the fiscal year ending June 30, 1953; an act continuing for one year the temporarily increased tax rates of 2% on retail sales, 5% on corporate income, and 7% on pari-mutuel betting; an act centralizing the authority and responsibility for handling the nonjudicial business of the courts in an administrative judge assisted by an administrative clerk and staff; an act establishing a division of parks and recreation and a division of forests; an act changing the name of the state F.E.P.C. to the Rhode Island Commission Against Discrimination and strengthening the basic act to ensure all persons equal rights to all public accommodations; an addition to the motor vehicle code requiring the guilty to satisfy accident-caused damages and to present evidence of future financial responsibility; an act providing for the installation of a general records management program; an act providing statewide care for the instruction of the "exceptional child," i.e., any educable child, physically, mentally or emotionally handicapped to such an extent that normal educational facilities are insufficient for his needs; an act appropriating \$50,000 for a study productive of a master plan to guide the development of state institutions, particularly the hospital for mental diseases; an

act establishing a rigid program for the control of brucellosis (Bang's disease), the cause of undulant fever; an act increasing the state pension benefits of all retired teachers to a minimum of \$1,600 annually; a companion act increasing by 25% the annual pension of all state employees retired prior to June 30, 1947; and a series of acts requesting public authorization of bond issues totalling \$14,100,000, the largest of which was for self-liquidating bonds of \$7,500,000 for the extension of work to halt the pollution of Narragansett bay. The most interesting measure, an administration bill to create the Industrial Development corporation whose bonds would be backed both as to principal and interest by the state, passed the lower house but failed to pass in the senate. During the year, three cities and three towns took advantage of the 1951 constitutional home-rule amendment to formulate for the people's consent new charters, of which one provided for a city manager and council, two provided for a town manager and council, and the remainder provided for a strong mayor and council.

The chief executive officers of the state elected in November 1950 for 1951-52 were Dennis J. Roberts, governor; John S. McKiernan, lieutenant governor; Armand H. Coté, secretary of state; William E. Powers, attorney general; Raymond H. Hawksley, general treasurer. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1951-52 there were in the public elementary schools 68,421 pupils and 21,291 teachers; in junior high schools 16,294 pupils and 851 teachers; in senior high schools (three years) 11,746 pupils and 703 teachers; in senior high schools (four years and vocational) 4,965 pupils and 243 teachers. Pupils attending private schools numbered: elementary 28,815; junior high 4,328; senior high (three years) 1,189; senior high (four years) 5,814. The total number of teachers in private day schools was 1,408. Current expenditures for day schools were \$21,510,311.43 and for evening schools \$65,299.11. The commissioner of education in 1952 was Michael F. Walsh, working under the state board of education of seven members whose chairman was C. B. Collins.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number of persons receiving public assistance in all categories in Aug. 1952 was 27,918 or about 3.5% of the state's population. The total amounts paid out during the year Sept. 1, 1951, to Aug. 31, 1952, were as follows: old-age assistance \$5,379,186; aid to dependent children \$3,786,074; aid to the blind \$128,491; aid to the disabled \$159,827. As of June 30, 1952, there were 36,107 persons receiving old-age and survivors insurance at a monthly rate of benefits totalling \$1,374,890. During the calendar year ending June 30, 1952, 977,293 separate benefit payments totalling \$20,976,202 were made from the unemployment compensation fund, receipts amounted to \$16,512,865. In the same period, 267,684 payments totalling \$6,390,723 were made from the temporary disability fund, receipts amounted to \$6,754,445. There were 583 inmates in corrective institutions on Aug. 31, 1952, and 5,891 patients in charitable institutions and institutions for defectives, the number in the latter being 4,200.

Communications.—In Jan. 1952 the total highway mileage (excluding roads and streets under the control of the seven cities) was 1,812 mi. of which 848 mi. were state roads built and maintained by the state into and through the cities and towns. At the close of 1951, railroads were operating 185.29 mi. of track in the state.

Waterborne commerce of the state for 1950 was 8,379,590 tons, of which 827,800 tons were foreign commerce (imports 827,703 tons, exports 97 tons); 7,007,778 tons were coast-wise (receipts 6,396,421 tons, shipments 611,351 tons) and 138,648 tons were local.

On Dec. 31, 1951, there were four publicly owned (state) airports and seven privately owned airports or landing fields. There were also two naval air stations owned by the United States.

Banking and Finance.—There were 23 banking institutions in 1952. Resources of 17 banks under state supervision totalled \$959,667,088.56, and of 6 banks under federal supervision, \$212,237,156.14. Savings deposits (exclusive of club accounts) in savings banks and trust companies (the 17 state banks) amounted to \$512,215,351 on June 30, 1952. In addition, 6 loan and investment companies had resources of \$5,436,910.11; 7 building and loan associations \$103,471,370.69; 41 credit unions \$24,634,281.04. The state closed its fiscal year on June 30, 1952, with receipts totalling \$60,995,912.01 (including federal grants of \$9,101,580.18); expenditures and encumbrances \$56,728,537.42; surplus from operation \$4,267,374.59; free surplus \$4,095,461.56. The state gross debt was \$50,242,000; net debt \$44,605,995.14.

Agriculture.—The total acreage of principal crops harvested was 44,100 in 1952. Cash income from crops in 1951 was \$6,516,000; from livestock

and livestock products \$19,745,000; from government payments \$86,000; total gross farm income \$26,347,000. The estimated value of livestock on Jan. 1, 1952, was \$10,613,000.

On Jan. 1, 1952, the livestock population of the state included: 1,000 horses and colts; 20,000 milk cows; 7,000 other cattle; 7,000 hogs; 5,000 sheep and lambs; 651,000 chickens; 1,105,000 commercial broilers; 5,000 turkeys; and 2,000 colonies of bees. Livestock products in 1951 included 138,000,000 lb. of milk valued at \$9,248,000; 1,046,000 chickens valued at \$1,468,000; 3,511,000 lb. of commercial broilers, \$1,022,000; 51,000 turkeys, \$384,000; 9,000,000 doz. eggs, \$5,743,000.

Industry and Manufacturing.—The estimated number employed in the state in Aug. 1952 was 298,500, distributed as follows: manufacturing 140,466; trade (wholesale and retail) 51,500; government (federal, state and local) 34,500; service personnel, medical, legal, etc. 23,400; transportation and public utilities 16,500; construction 19,500; finance, insurance and real estate 11,800; miscellaneous 11,800. (Farmers, self-employed, domestics and armed services personnel are excluded.)

Employment in manufacturing in Aug. 1952 totalled 119,717 product wage earners and 20,749 nonproduction workers (salaried personnel). The weekly pay roll was \$6,910,877 for all manufacturing industries in Rhode Island according to the state department of labour. Wage earners were distributed among manufacturing industries as follows: textiles 5,498; jewellery-silverware 19,798; metals and machinery 36,359; rubber products 6,408; apparel 3,153; food 4,855; miscellaneous 19,395. The number of establishments employing four or more workers was 10,503 in Sept. 1952, and the estimated number of persons employed was 240,000 (Jo. C. M.).

Mineral Production.—Rhode Island's mineral production is limited mainly to building materials. In 1949 it included 398,487 short tons of sand and gravel (valued at \$378,896), 74,670 tons of stone (\$451,029), and other nonmetallics valued at \$98,760; total value \$928,685. In 1950 sand and gravel increased to 579,528 tons (\$580,322), and stone to 239,400 tons (\$798,186), while other nonmetallics dropped to \$47,000; total value \$1,425,508. Data for 1951 were not yet available.

Rhodesia, Northern. A British protectorate in central Africa. Area: 290,320 sq.mi. Pop. (1951 est.): 1,947,000 incl. (May census) 39,842 Europeans. Religion: pagan (about 80%) and Christian. Chief towns (European pop. 1950): Lusaka (cap. 4,615), Nkana-Kitwe (5,234), Luanshya (4,685), Mufulira (3,322), Ndola (2,962). Government in 1952, Sir Gilbert Rennie.

History.—The protectorate's favourable balance of trade for 1951 of about £31,600,000—a new record—was the result of an increase in world prices for base metals, which formed more than 95% of the territory's exports. The increase in copper prices doubled Northern Rhodesian revenue in the period 1951-52. During 1952 the development plan was again reviewed and its cost was now estimated to be £36,000,000 (previous estimate £19,000,000); £3,140,000 was earmarked for urban African housing. The number of houses built was almost up to schedule but still far short of needs. Plans for hydroelectric schemes at the Kafue and Kariba gorges were under consideration during the year, but no decision was reached.

On April 8 the government issued a draft statement on partnership containing proposals for more representatives of African interests in the next legislative council: Europeans and Africans must recognize each other's rights to a permanent home in Northern Rhodesia. It was intended that Africans should have equal representation with Europeans in the legislative and executive councils. The repeal of all differential legislation would not be in the Africans' best interests, but the government would propose amendments from time to time.

Henry Hopkinson, the British minister of state for colonial affairs, visited Northern Rhodesia in August in the course of an inquiry about the proposed central African federation. Also in connection with federation the Northern Rhodesian African congress announced that a small delegation would go to London at the end of the year. A strike of all African copper mine workers began on Oct. 20. The demand was for another 25% a shift, but many more complex issues were involved.

Education.—Schools (1951): government primary 55, pupils 25,600; government secondary 2, pupils 468; independent secondary, pupils 55.

Finance and Trade.—Monetary unit: Southern Rhodesian pound (£SR) £1 sterling). Budget (1952 est.): revenue £23,661,863; expenditure £23,746. Foreign trade (1951): imports £35,400,000; exports £67,000,000. Principal exports (1951 values): copper (blister and electrolytic) £3,036,423; lead £1,926,210; zinc £5,699,444; tobacco £1,638,523.

Rhodesia, Southern. A self-governing British colony in central Africa, Southern Rhodesia is separated from Northern Rhodesia by the Zambezi river and bounded northeast and east by Portuguese East Africa, south by Transvaal and southwest and west by Bechuanaland protectorate. Area: 150,333 sq.mi. Pop. (1951 census): 2,146,324 including 136,017 Europeans (as compared with 75,000 at the 1946 census), 4,343 Asians and 5,964 mixed. Chief towns (1951; European pop. only): Salisbury (cap., 40,510); Bulawayo (32,269); Umtali (5,762); Gwelo (5,115). Languages: English (official), Afrikaans and tribal dialects. Religion: Africans mainly pagan, Christian minority. Governor in 1952: Maj. Gen. Sir John Kennedy; prime minister: Sir Godfrey Huggins.

History.—A loan of \$28,000,000 for the Southern Rhodesian four-year plan, from the International Bank for Reconstruction and Development, emphasized the importance of industrial development during 1952. The Hunyani Poort dam, designed to enclose 55,000,000,000 gal. of water, was completed. Work started on the £4,500,000 southeast rail link to Lourenço Marques. The railway from Sinoia to Kafue (Northern Rhodesia), the next priority, was due to be started in 1956. Both lines would carry heavy mineral export traffic. A 30-mi. pipe line from the Zambezi to the Wankie coal fields, opened by the prime minister, Sir Godfrey Huggins, on Aug. 2, was the first tapping of the Zambezi for domestic and industrial water.

Coal output was expected to set a record. Monthly production of asbestos sometimes exceeded gold in value. Import controls on goods from nonsterling sources were rigidly imposed. In the budget of April 18 the income tax was raised by 6d. in the pound, but purchase tax proposals were dropped because of strong public opposition. In July it was announced that the net national income for 1951—£99,200,000—was more than double the 1946 figure.

Immigration quotas to ease the strain on accommodation and on the rail transport "bottleneck" cut the inflow (January-July) to 9,644 (1951: 17,561). The cost-of-living index rose to 127 in July, as compared with 100 in Oct. 1949. A £5,000,000 housing project for Africans near Salisbury and the creation of a commission on African higher education (chairman, Sir Alexander Carr-Saunders) were two important features in African development.

A contingent of the Rhodesian African rifles served in the Suez canal zone; in Malaya, the far east volunteer unit continued jungle operations. A new register of voters was closed in August when 46,682 names were on the common rolls as compared with 54,401 in Nov. 1951. (See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; RHODESIA, NORTHERN.) (C. L. BK.)

Education.—European (1951): government primary schools 85, teachers 567, pupils 16,242; high schools 17, teachers 354, pupils 5,822; aided and recognized European schools 20, teachers 214, pupils 3,927; aided farm schools 9, teachers 9, pupils 143. Asian and mixed: government schools 12, teachers 69, pupils 1,974; other schools 6, teachers 36, pupils 984. African: government primary schools 11, teachers 8 European and 184 African, pupils 6,226; aided primary schools 2,142, teachers 274 European and 6,110 African, pupils 225,325; government postprimary schools 3, teachers 29 European and 31 African, pupils 889; aided postprimary schools 15, teachers 23 European and 16 African, pupils 686; aided teacher training schools 22, teachers 68 European and 14 African, students 961. There are also 3 aided schools for deaf and dumb and blind with 4 European and 9 African teachers, 151 pupils.

Finance and Banking.—Monetary unit: Southern Rhodesian pound (£SR=£1 sterling); circulation including Northern Rhodesia and Nyasaland less bank holdings (Aug. 1952) £12,945,000. Budget (1951-52): revenue £21,246,022, expenditure £23,219,025; (1952-53 est.) revenue £28,789,000, expenditure £28,125,685. National debt (March 1951) £105,810,235. National income (1951 est.) £98,900,000.

Transport and Communications.—Main roads (1951): 2,500 mi. plus 13,100 mi. hard surfaced. Railways (including Northern Rhodesia): 2,496½ mi.; (1951) passenger traffic 2,964,082; freight 6,689,264 tons.

Agriculture.—Tobacco (Virginia 1951-52): 97,205,254 lb. (farm weight).

Industry.—Fuel and power: coal (1951) 2,299,000 metric tons; electricity (year ended March 31, 1952) 354,799,124 units sold. Raw materials (1951): gold 486,907 oz.; asbestos 77,663 tons; chrome 330,989 tons.

Rice. The indicated 1952 U.S. rice crop of 47,730,000 bags (100 lb. each) again set a new record, 9% larger than the previous record of 43,805,000 bags (1951) and 45% larger than the 1941-50 average. The 1,956,000 ac. harvested approximated those of 1951 and the official rice acreage goal, but greatly exceeded the 1941-50 average of 1,569,000 ac. The indicated yield of 2,440 lb. per acre much exceeded the 2,250 lb. of 1951 and the 1941-50 average of 2,084 lb. As in 1951, Texas was the leading producer (13,402,000 bags), Louisiana second (12,320,000 bags), and California third (11,550,000 bags).

It was anticipated that about 26,000,000 cwt. of the crop would be required domestically, including 18,500,000 cwt. for food, thus allowing for much above normal rice exports. U.S. exports from the 1951 crop rose to an unprecedented 17,179,000 cwt. of milled rice, eight times larger than the prewar average. Prices during the harvest season of \$5.30 per hundredweight were favourable compared with \$4.00 per hundredweight a year earlier. The national minimum average support rate was \$5.04 per hundredweight. Export allocations of 7,280,000 cwt. of milled rice were announced for the period Aug. through Dec. 1952, about one-third of it to Cuba.

World-wide, a moderately favourable situation regarding the new rice crop was indicated for most areas, with acreage expanded about 10% compared with pre-World War II. A record crop of 176,000,000 tons was forecast, 8,000,000 tons more than during the previous year and 5% more than before World War II. The demand continued to be in excess of available export supplies.

Exports (1951) were 11,030,000 cwt., the largest in six years,

Rice Production of the Principal Producing Countries
(In millions of pounds; rough)

Country	1952-53*	1951-52	1950-51	Average, 1935-36 1939-40
China		98,000	103,500	110,372
India		75,000	70,000	74,740
Pakistan		26,046	27,560	24,340
Japan	26,300	24,800	26,443	26,791
Thailand		16,000	14,951	9,589

Burma		13,000	11,505	15,683

*Preliminary.

but only 55% of the prewar average. Prices in the autumn of 1952 were up by nearly 50% in some exporting countries. Two-thirds of the Burma exports were on a government to government basis, at a price of about 10 cents per pound. (J. K. R.)

Ridgway, Matthew Bunker (1895—), U.S. general, was born on March 3 at Fort Monroe, Va. He graduated from the U.S. Military academy at West Point in 1917, and was assigned as an instructor at West Point during World War I. He later saw service in China, Nicaragua and the Philippines, and at the outbreak of World War II was serving in the war plans division of the war department in Washington, D.C. He was given command of the 82nd infantry division, which was later converted into an airborne division, and which he led in invasions of Sicily in 1943 and Normandy in 1944. He was Gen. Dwight D. Eisenhower's representative on the United Nations Military Staff committee in 1946, U.S. Caribbean commander in 1948, and was serving as deputy chief of staff for administration when he was called to replace Lt. Gen. Walton H. Walker when the latter was killed in Korea, Dec. 1950. As commander of the U.S. 8th army, he engineered the U.N. forces' comeback against the North Koreans. When Pres. Harry S. Truman dismissed Gen. Douglas MacArthur, April 11, 1951, he named General Ridgway to succeed to MacArthur's commands in the far east. It was under General Ridgway that the prolonged truce talks began in July 1951.

On April 28, 1952, Ridgway was appointed supreme commander of Allied powers in Europe by President Truman to suc-

ceed Eisenhower. He formally took over his command at Rocquencourt, Fr., on May 30 and spent much of the rest of the year visiting NATO countries. On July 8 he was given command of all U.S. military, air and naval forces in Europe.

Rio Muni: see SPANISH COLONIAL EMPIRE.

Rivers and Harbours. In 1952 construction was executed on 170 regular river and harbour projects by the U.S. corps of engineers; of this number 15 were completed. Maintenance was performed on a total of 351 projects, including the extensive intercoastal waterways and Mississippi river system, the connecting channels on the Great Lakes, the 531 navigation locks and dams and 417 harbours, and also the channels and canals of the Ohio river system, the upper Mississippi river, the Illinois waterway, the hydroelectric generating plants on the Missouri river at Fort Peck, Mont., and the Columbia river at Bonneville, Ore. During the fiscal year ended June 30, 1952, \$192,657,613 of federal funds was expended for new work and maintenance of river and navigation projects and inland and coastal harbours.

The Rivers and Harbors act passed July 11, 1952, provided \$236,888,800 for maintenance and improvement of U.S. rivers and harbours. Of this total, \$158,435,800 was allotted to new construction work on 26 projects in 23 states, the District of Columbia and Alaska. Maintenance, operation and care were allotted \$73,458,900; advance planning \$405,000; examination, survey and other study programs \$825,000; and transfer to

MODEL of a section of the Niagara river built by Canadian engineers. It was used in 1952 to determine the most favourable place, on the Canadian side, for building a water intake to lead to a projected generating station

other federal and state agencies \$3,664,100. A special \$100,000 was allotted Niagara river investigations in New York state.

The river and harbour projects completed in fiscal year 1952 included Columbia river at Bonneville, Ore.; Depoe Bay, Ore.; Mianus river, Connecticut; Josias river, Maine; deepening of channel in Newark bay, Hackensack and Passaic rivers, New Jersey; deepening Ambrose channel, New York, harbour; Hudson river channel, New York; York Spit channel, New York; Harrison county shore protection, Mississippi; Georgetown harbour, South Carolina; Missouri river channel (excluding St. Anthony falls and Keokuk lock) at Clinton, Ia.; Calcasieu lock, Louisiana; Lorain harbour, Ohio; Morgantown lock and dam, Pennsylvania.

The important river and harbour projects allotted \$1,500,000 or more for construction work were: Arkansas river and tributaries, Arkansas and Oklahoma, \$4,000,000; Demopolis lock and dam, Tombigbee-Warrior rivers, Alabama, \$4,500,000; Jim Woodruff lock and dam, Apalachicola river, Florida, \$10,330,000; Intracoastal waterway, Jacksonville to Miami, Fla., \$2,000,000; Buford dam, Chattahoochee river, Georgia, \$3,000,000; Missouri river between Kansas City, Mo., and Sioux City, Ia., Kansas, Missouri and Nebraska, \$4,250,000; Missouri river, Kansas City to mouth, Missouri, \$2,300,000; McNary lock and dam, Columbia river, Washington and Oregon, \$63,000,000; the Dalles lock and dam, Columbia river, Washington and Oregon, \$20,000,000; Lock 2, Monongahela river, Pennsylvania, \$2,700,000; Cheatham lock and dam, Cumberland river, Tennessee, \$5,000,000; Old Hickory lock and dam, Cumberland river, Tennessee, \$10,000,000; Chief Joseph dam, Columbia river, Washington, \$15,000,000.

At the end of fiscal year 1952, congress had made an over-all total of 2,279 authorizations for river and harbour improvements since the program was adopted by the federal government in 1824. Of these, 1,721 projects had been completed; 189 had been placed under current construction; and 369 were not yet started. Total funds appropriated for construction and maintenance were \$4,144,000,000. Funds required to complete the authorized improvements totalled \$4,432,600,000. Total mileage of rivers and canals improved for modern navigation was 28,600, with 417 improved harbours.

At the Bonneville dam and reservoir, Oregon and Washington, the ten electric-power generating units were operated at their 518,400-kw. capacity throughout the year. At the Fort Peck dam on the Missouri river in Montana, the reservoir was operated throughout the year for maintenance of navigation on the Missouri river and for the secondary purposes of flood control and hydroelectric production. Operation of the generating units was continued during a major portion of the year at an 85,000-kw. capacity. (G. HB.)

Canada.—A contract was let for an 875-ft. extension to the Saint John dock terminal to increase handling capacity and speed shipping. The federal department of transport announced improvements to Quebec harbour to be started as early as feasible in 1953, including new harbour sheds and dredging of the estuary of the St. Charles river. Improvements to cost \$7,300,000 were also announced for Montreal harbour, to handle the enlarged traffic flow expected from the projected deepening of the St. Lawrence seaway. As a long-range plan, Toronto harbour commissioners took initial steps toward the creation of berths for a minimum of 12 ocean liners, for traffic expected when the seaway would be completed. (See also CANALS AND INLAND WATERWAYS.) (C. Cy.)

Roads and Highways. Despite adverse political and economic conditions throughout much of the world in 1952, there was general progress in high-

way improvement, and in some countries the progress was notable. Every country recognized the importance of highway transport in the development of a sound economy. The greatest obstacle to improvement was lack of funds, particularly in those countries that had to import highway construction equipment and materials.

United States.—The United States, with the largest system of improved highways and the greatest number of motor vehicles, continued to lead in the size of its annual highway program. It was estimated that expenditures amounted to \$2,900,000,000 for construction, \$1,600,000,000 for maintenance, and that 110,000 mi. were completed during the year. In greater part, this work consisted of modernization and resurfacing of old highways but in many instances the process of modernization required some relocation. Of the 2,990,000 mi. of rural road, approximately 1,755,000 mi. had a surface of some kind by the end of 1952.

Highway usage continued the phenomenal growth that began at the end of World War II and during the year reached a rate of 500,000,000,000 vehicle-miles annually. Congestion continued to grow on the principal arteries of all cities and on main inter-city routes. Public demand that highway improvement be accelerated became even more intense than in previous years but, in general, did not produce conspicuous results.

Many notable projects were completed or under construction during the year. New Jersey completed a 118-mi. north-south toll highway across the state, terminating at the George Washington bridge entrance to New York city.

Maryland completed a four-mile bridge across Chesapeake bay, described as the largest continuous, entirely over-water steel structure in the world. The bridge ties together two sections of the state separated by a wide body of water. An impressive feature of the year's work was the number of express highways being built in and near both large and medium-size cities. Most often the projects were sections of much more extensive improvements which, because of the cost, would have to be spread over a period of years. The Hollywood freeway in Los Angeles, Calif., is an example. The first section of this ten-mile artery was completed in 1940. The last section was nearing completion in 1952. Near the centre of the city, the highway was serving from 90,000 to 100,000 vehicles daily.

Federal-aid highway improvement was carried on with federal funds authorized at a rate of \$500,000,000 for each of the fiscal years 1952 and 1953. Federal and federal-aid projects completed during the fiscal year ending June 30, 1952, including work in national forests, national parks, other federal areas and miscellaneous federal projects, totalled 18,110 mi.

Canada.—The construction of the Trans-Canada highway, financed co-operatively by the federal government and the provinces, continued to attract wide interest. This 5,000-mi. \$300,000,000 highway scheduled for completion in 1956, was the largest east-to-west construction project since the Canadian Pacific and Canadian National railways were built. Eight provinces were spending about \$30,000,000 (including the federal government's contribution) on this route during the year. While this highway was the most spectacular activity, it was only a small part of the year's over-all program of \$240,000,000 for new construction. This program was well-balanced with work continuing on main provincial routes, secondary roads and urban extensions, despite material shortages. Work was begun on the Canso Strait causeway, a combination railroad and highway link between Cape Breton Island and the Nova Scotia mainland. This causeway crosses the strait at a point 4,000 ft. wide with the water reaching a maximum depth of 185 ft. The work was scheduled for completion in three years at an estimated cost of \$22,000,000.

AUTOMOBILES PLOWING through water on Chicago's outer drive, parallel to Lake Michigan, as high winds forced waves onto the roadway. Parts of the drive were being relocated on higher ground in 1952 to avoid recurrent flooding

Mexico.—The year's budget (an all-time high) amounted to \$63,000,000 for the completion of highways already under construction, including the Guadalajara-Nogales and the Veracruz-Coatzacoalcos roads. A unique method of financing secondary road construction was in use. Various industrial and commercial organizations, such as equipment dealers, tire manufacturers, oil companies, hotel associations and others, realizing the benefits to be gained through the expansion of highway transport, made substantial contributions to the financing of local roads.

Central and South America.—Work on the Inter-American highway continued in Costa Rica, El Salvador and northern Panamá. Considerable work remained to be done in completing the highway in Guatemala, Costa Rica and northern Panamá.

Guatemala began extensive work looking toward the completion of the highway extending northeasterly from the capital to Puerto Barrios, which is the Caribbean outlet for both Guatemala and El Salvador. This road would supplement the existing narrow-gauge railroad which had been the only means of land communication with the Caribbean coast.

Honduras was carrying out a program of pioneer road development to make truck travel possible to areas that had been accessible only over pack trails or by air. This program was complicated by the rugged mountainous terrain which made even pioneer road construction difficult and expensive. Transportation by truck, even over a low-type pioneer road, was so much less expensive than by pack mule that a rapid increase in agriculture was noticed in areas reached by new roads.

Colombia started work on a \$40,000,000 program aimed at connecting all of the major cities and the Pacific and Caribbean ports. Work on several sections was begun.

In Brazil the opening of the paved President Dutra highway linking the cities of Rio de Janeiro and São Paulo reduced the travel time by road between those cities from 11 to about 6 hr. Trucking rates were reduced by almost 50% and for the first time regular passenger bus service between the two cities was established.

Asia and the Far East.—In the Philippines, with the end of the large-scale road, street and bridge rehabilitation program, begun in 1946 with the assistance of the United States, the emphasis was shifted to development roads as an aid in the settlement of unpopulated but potentially rich areas in Mindanao. The road system in the Philippines, over-all, was the best in the far east but it fell far short of meeting the needs developed by the phenomenal increase in motor vehicle usage since World War II. The Philippine legislature considered basic changes in highway legislation to alleviate the situation.

Road construction in India was complicated by the lack of adequate supplies of asphalt, cement and, in some areas, even of stone. It was made more difficult, too, by the need for highways to accommodate both motor vehicles and bullock carts. The steel-tired carts were particularly destructive to asphalt road surfaces.

Pakistan proposed a six-year program to improve 13,167 km. of existing road (88% unsurfaced) and to construct 3,562 km. of new road costing (U.S.) \$12,000,000.

Ceylon's ambitious 20-year development plan was estimated to cost (U.S.) \$93,000,000, with \$28,000,000 for main trunk roads, \$50,000,000 for minor trunk routes, \$9,000,000 for local roads and \$6,000,000 for bridges.

Iraq was financing a four-year development plan from oil revenues. Included in the plan was the improvement of 3,400 km. of main road and the construction of about 8,000 km. of feeder roads. This work, to be carried on concurrently with irrigation development, was intended to increase the agricultural resources of the country.

Turkey's 1952 highway budget of approximately (U.S.) \$30,000,000 represented an increase of about 15% over the preceding year. Work was continued on the national highway system by a modern highway department established with technical assistance from the U.S. bureau of public roads.

Africa.—A series of international conferences had done much to co-ordinate highway construction activities in the various countries and to establish interconnecting road systems. The various countries were vigorously prosecuting their programs.

The Belgian Congo embarked on a ten-year plan for transportation improvements, in which highways played an important part. First priority was given to the construction of five main roads linking the major cities of the Congo with areas inadequately served by rail and waterways.

Great Britain allocated about \$4,000,000 in U.S. aid funds for highway construction in Tanganyika, Northern Rhodesia and Nigeria to supplement local revenues and normal home government allotments. (See also MOTOR TRANSPORTATION.)

Roller Derby. The New York Chiefs won the championship for the third time in the four-year history of roller derby's world series competition by sweeping aside three rival teams in the season's climactic round-robin meeting at the Chicago coliseum. The defending champions, who previously had won in 1949 and 1951, went undefeated in the series, defeating the Jersey Jolters, 30-28; the Brooklyn Red Devils, 29-27; and the Chicago Westerners, 31-15 and 30-13. Sam Skobel paced the New Yorkers in the final-game rout of the Westerners with 11 points as Hank Goldberg tallied 5 and Charley Saunders accounted for 4. Bert Wall, who registered 5 points, was high man for the Chicagoans, who had edged out the Chiefs for the title during the regular league campaign. Wall

also won honours as the series high scorer with 39 markers in five games.

Saunders, who counted 27 points for the Chiefs in four contests, won the men's trophy as the most valuable player in the series; while Barbara Mateer, a Woodbridge, N.J., girl, who starred in a losing cause for the Westerners, annexed the most valuable player award for women. (T. V. H.)

Roman Catholic Church. In 1952 the College of Cardinals was reduced to 46 members by the deaths of Giovanni-Battista Cardinal Nasalli-Rocca di Corneliano, Alessio Cardinal Ascalesi and Michael Cardinal von Faulhaber.

Addressing the people by radio in February, Pope Pius XII appealed for a "return to Jesus Christ, the Church and the Christian way of life" as the only means of avoiding dangers that are threatening a world started on the road to ruin. To set an example of the sort of co-operation which he said is necessary, his holiness urged all well-intentioned persons in Rome, including municipal officials and private citizens, to join forces under the leadership of the acting bishop of Rome, Clemente Cardinal Micara. He said he hoped the Rome program would be imitated by dioceses near and far.

Speaking to the National Council of the Christian Union of Entrepreneurs and Managers, the pope urged management and labour to be guided by human sentiments in their mutual relations and to work together in harmony for the common welfare of mankind. The trouble with the present social order, said the pope, is that it is "not profoundly Christian nor truly human but purely technical and economic and that it does not rest at all on that which should be the base and solid foundation of its unity, namely the common character of men by nature and of sons of God by divine adoption."

Warning against the "new conception of Christian morality" based not on universal moral laws, such as the Ten Commandments, but on the real and concrete conditions or circumstances in which men must act, and according to which the conscience of the individual must judge and choose, Pope Pius gave three considerations or maxims to the international congress of the World Federation of Catholic Young Women: "The first: we grant that God wants first and always a right intention. But this is not enough. He also wants the good work. A second principle is that it is not permitted to do evil that good may result. But this new ethic, without perhaps being aware of it, acts according to the principle that the end justifies the means. A third maxim is that there may be situations in which a man and especially a Christian cannot be unaware of the fact that he must sacrifice everything, even his life, in order to save his soul."

A moral code for doctors was laid down by Pope Pius in addressing surgeons attending the first International Congress of Histopathology. He declared that three factors must be taken into account "to morally justify new proceedings, new attempts and new methods of medical research and treatment": the interests of medical science, the individual interest of the patient to be treated and the interest of the community. "It is an evident law that before applying new methods on living men, research on bodies should be performed or the method of experimenting on animals used," he said, adding that when this is impossible experiments on living men may be conducted on the basis of his code.

The church in Communist-controlled countries continued to suffer persecution. In China Bishop Francis X. Ford died in a prison hospital after having been under arrest for more than a year. Of the 1,435 Catholic missionaries still in China, 145 were in prison, including 17 bishops, 107 priests, 17 sisters

and 4 brothers. Pope Pius sent a letter to the clergy and people of China in January urging them not to lose heart in the face of persecutions and hardships and assured them that the church can be opposed and combatted but not conquered." Bulgaria passed a law nationalizing churches and forbidding them to have any contact with the outside world and sentenced a bishop and 3 priests to death; 24 other priests were imprisoned. The Vatican radio reported in March that at least six Rumanian bishops had died of Communist maltreatment leaving only four alive, all held in the U.S.S.R. An apostolic letter addressed to the Russian people called upon them to join his holiness in prayer for the bolstering and expansion of Christian faith in their nation and for that "just liberty which is the right of the human person." He asked them to resist, "if necessary unto death," the atheistic and materialistic features of communism. The pope's wishes for the U.S.S.R. and for all other countries, the message said, were that each people enjoy civil liberty inside its own frontiers, that each achieve a "just and reasonable material prosperity" and that each person be in a position to protect his own human dignity, enjoying the right to worship God openly.

In 1952 the Roman Catholic population of the United States, Alaska and the Hawaiian Islands was 29,407,520. This figure represented an increase of 772,642 since the year before. There were 29,241,580 Catholics in the continental United States. There were 24 archdioceses, 105 dioceses, and 1 vicariate apostolic, Alaska. There were 3 cardinals, 27 archbishops, 158 bishops, 38 abbots, 44,459 priests, 7,975 brothers and 156,696 sisters.

War relief services of the National Catholic Welfare conference reported 29,139,438 lb. of relief materials valued at \$12,40,638.75 were dispersed in the six-month period ending in May.

The National Council of Catholic Youth initiated *Vision*, a new monthly magazine in the field of Catholic youth. The new publication would concern itself with all matter directly or indirectly affecting young people, their problems and aspirations.

Among the awards given during the year was the Laetare medal, presented by Notre Dame university, Notre Dame, Ind., to a distinguished Catholic layman, Thomas E. Murray of New York city, a member of the Atomic Energy commission. Archbishop Karl J. Alter of Cincinnati, O., was honoured with the 1952 Rerum Novarum award "for outstanding contributions to the establishment of management-labor relations in accordance with the Papal Encyclical." Charles F. Vatterott, Jr., of St. Louis, Mo., past president of the Catholic Interracial Council of St. Louis, and Joseph J. Yancey, Negro founder and director of the Pioneer Athletic Club of New York city, received the James J. Hoey awards for "outstanding contributions to the cause of interracial justice." (See also CHURCH MEMBERSHIP; MISSIONS, FOREIGN [RELIGIOUS]; PIUS XII; RELIGIOUS EDUCATION; SOCIETIES AND ASSOCIATIONS, U.S.; VATICAN CITY STATE.) (J. LAF.)

On Nov. 29, 1952, Pope Pius XII named 24 prelates to become cardinals at a consistory to be held Jan. 12, 1953. The cardinals-designate were as follows:

Carlo Agostini, patriarch of Venice, It.
 Eusebio Costantini, titular archbishop of Theodosiopolis, secretary of the Sacred Congregation for the Propagation of the Faith.
 Augusto Elviro Da Silva, archbishop of San Salvatore della Baía, Braz.
 Gaetano Cicognani, titular archbishop of Ancyra, apostolic nuncio to Spain.
 Angelo Giuseppe Roncalli, titular archbishop of Mesembria, apostolic nuncio to France.
 Gaetano Valeri, titular archbishop of Ephesus, assessor of the Sacred Congregation for the Oriental Church.
 Pietro Ciriaci, titular archbishop of Tarsus, apostolic nuncio to Portugal.
 Francesco Borgongini Duca, titular archbishop of Heraclea in Europa, apostolic nuncio to Italy.
 Maurice Feltin, archbishop of Paris, Fr.
 Marcello Mimmi, archbishop of Naples, It.

BISHOP FULTON J. SHEEN, national leader of the Society for the Propagation of the Faith, during one of his TV broadcasts which began in 1952. The programs were largely monologues, aimed at relating faith to daily living

Carlo Maria de la Torre, archbishop of Quito, Ecua.
 Aloysius Stepinac, archbishop of Zagreb, Yugos.
 Georges François Xavier Marie Grente, archbishop-bishop of Le Mans, Fr.
 Giuseppe Siri, archbishop of Genoa, It.
 John d'Alton, archbishop of Armagh, Ire.
 James Francis McIntyre, archbishop of Los Angeles, Calif.
 Giacomo Lercaro, archbishop of Bologna, It.
 Stephen Wyszyński, archbishop of Gniezno and Warsaw, Pol.
 Beniamino de Arriba y Castro, archbishop of Tarragona, Sp.
 Fernando Quiroga y Palacios, archbishop of Santiago di Compostela, Sp.
 Paul Emile Léger, archbishop of Montreal, Que.
 Crisanto Luque, archbishop of Bogotá, Col.
 Josef Wendel, archbishop of Munich and Freising, Ger.
 Alfredo Ottaviani, assessor of the Sacred Congregation of the Holy Office.

Rotary International: see SOCIETIES AND ASSOCIATIONS, U.S.

Rowing. The XVth Olympiad on Meilahti gulf at Helsinki, Fin., was the most important event in rowing in 1952. Thirty-three nations with 107 entries competed in July over a 2,000-m. course. Seventeen of these reached the finals. The United States entered all seven events and won two: the eights and the pairs without coxswain. (See also OLYMPIC GAMES.)

Six nations shared in winning seven events. Great Britain, Germany, Poland, Belgium, Australia and Denmark went without firsts, but gained the finals one or more times. The Olympic rowing surprises were the U.S.S.R. and Argentina.

YALE VARSITY (left) finishing ahead of Harvard by a length during the 4-mi. upstream classic on the Thames river, Conn., in 1952. The occasion also marked the centenary of intercollegiate rowing in the U.S.

The United States entries were selected from 61 competitors in a three-day regatta on Lake Quinsigamond, Worcester, Mass. They were: singles—John B. Kelly, Jr., Navy, and Charles J. McIlvane, Jr., Vesper Boat club of Philadelphia, Pa., alternate; doubles—Bernard "Pat" Costello and Walter Hoover, Jr., Detroit (Mich.) Boat club; pairs without coxswain—Charles P. Logg, Jr., and Tom Price, Rutgers university; pairs with coxswain—Duvall Hecht, Jim Fifer and Jim Beggs (coxswain), Stanford university, Stanford, Calif.; fours with coxswain—University of Washington, Seattle; fours without coxswain—U.S. Naval academy, Annapolis, Md.; eights—U.S. Naval academy.

The U.S. Olympic tryouts were part of the National Association of Amateur Oarsmen's 78th championships. The ten non-Olympic events were contested on the Schuylkill river at Philadelphia, Pa. From these combined regattas the New York Athletic club emerged with the Barnes trophy for the greatest number of points. Actually the club was tied with Navy but had more firsts to its credit.

In the intercollegiate regattas Navy dominated the field, being undefeated in each of the 14 races it entered, including a sweep of the Intercollegiate Rowing association's regatta held for the first time on Lake Onondaga at Syracuse, N.Y., and the winning of the varsity, junior varsity and freshman races in the Eastern Association of Rowing Colleges' sprint championships on Lake Carnegie at Princeton, N.J. Princeton was second in the Intercollegiate Rowing association competition at three miles, and the University of Wisconsin, Madison, was runner-up in the sprint championship.

The 150-lb. varsity crew of the University of Pennsylvania, Philadelphia, led its field, retaining the Wright trophy and successfully defending the Thames Challenge cup at the English Henley.

Twenty-seven crews faced the starter in the Intercollegiate Rowing regatta (varsity and junior varsity at three miles and freshmen at two miles). The varsities finished as follows: Navy 15 min. 8.1 sec.; Princeton 15 min. 20.4 sec.; Cornell 15 min. 23.7 sec.; Wisconsin 15 min. 31.1 sec.; followed by California, Columbia, Washington, Stanford, Pennsylvania, Massachusetts

Institute of Technology and Syracuse.

Twenty colleges competed in the sprint championships 2,000 m. at Princeton, N.J. The results in the varsity were follows: Navy 6 min. 3.7 sec.; Wisconsin 6 min. 9.9 sec.; Harvard 6 min. 11.1 sec.; Cornell 6 min. 15.8 sec. Junior varsity: Navy 6 min. 11.8 sec.; Pennsylvania 6 min. 17.8 sec.; Harvard 6 min. 22.2 sec.; Princeton 6 min. 25 sec. Freshman: Navy 6 min. 15.7 sec.; Harvard 6 min. 16.3 sec.; Cornell 6 min. 18.1 sec.; Pennsylvania 6 min. 31.6 sec. In this latter regatta the Rowe cup totals for points were: Navy 24; Harvard 9; Wisconsin 6; Pennsylvania 5; Cornell 1.

In other college regattas Penn beat Rutgers on the Raritan river; Navy won the Adams cup from Penn at Cambridge, Mass.; Princeton the Carnegie cup from Yale and Cornell. Penn captured the Blackwell cup from Yale and Columbia on the windswept Harlem river and took the Childs cup for the third successive year from Princeton and Columbia on the Schuylkill. Navy beat Yale on the Housatonic and Princeton on the Severn river.

La Salle college of Philadelphia retained the Dad Vail trophy in the tenth regatta at Boston, beating Rollins college of Winter Park, Fla., by a few feet, followed by Dartmouth, Florida Southern, Marietta, American International college of Springfield, Mass., Brown and Tampa university. Wisconsin triumphed over California on Lake Mendota, and Yale won the only four-mile classic in U.S. waters over Harvard by a length. This 87th regatta between the pioneer rowing colleges commemorated the 100th year of collegiate rowing in the United States. Yale won the junior varsity race by three feet, but was easily beaten by the Harvard yearlings. Harvard won both Compton and Goldthwaite cups from Princeton and Yale, respectively.

On the Pacific coast, California swept the regatta with Washington for the first time in 42 years, and then won the Pacific coast sprint championships from Stanford.

Cornell beat Harvard in a late-season contest.

The 18th national Schoolboy championships on the Potomac river produced a new champion in the featured eight-oared shell event. Belleville (N.J.) High school won this in record time of 5 min. 0.8 sec. Lafayette High school of Buffalo, N.Y., was second in 5 min. 3.2 sec. and George Washington High school of Alexandria, Va., third in 5 min. 4.4 sec. Preston Janes, Lincoln Prep School, Philadelphia, Pa., won the championships singles and Walter Hoover, Jr., the junior singles.

In England, Oxford upset Cambridge at $4\frac{1}{4}$ mi. during a blizzard. The time was 20 min. 23 sec., which was $2\frac{1}{2}$ min. off the record because of conditions in the 98th running of this class.

At the Royal English Henley, Leander won the Grand Challenge cup from Australia in 6 min. 38 sec. by half a length. Pennsylvania retained the Thames Challenge cup, and Mervyn Wood of Australia defeated defending diamonds champion Anthony Fox of England in 8 min. 12 sec. by $2\frac{1}{2}$ lengths.

United States crews dominated the Royal Canadian Henley at Port Dalhousie, Ont. The Buffalo (N.Y.) West Side Rowing club won the Maple Leaf point trophy and the Ned Hanlon trophy for eights. Joseph Angyal of the New York Athletic club captured the single sculls championship from Gabby Beaudry of Lachine, Que. In all, the West Sides won seven firsts in the four-day regatta.

In April the world's professional sculling championships changed hands when Jim Saul, a little-known Australian sculler, defeated Evans Paddon on the Richmond river at Lismo, Austr., by a deck length.

Natural Rubber.—The unrest and guerrilla warfare which had plagued some of the large rubber-producing areas continued during 1952. Over-all world production in the first half of 1952 as compared with the same 1951 period was down an estimated 122,500 long tons, in large part the result of a striking reduction in Indonesian small holders' output. The situation was dominated by a falling price structure which began in Feb. 1951. The average price of crude rubber in Jan. 1952 stood at about 48 U.S. cents per pound for dry rubber based on the Singapore market and rapidly settled to about 30 U.S. cents per pound at the end of May. There it stabilized and at the end of August the price stood at about 29 U.S. cents per pound. Despite this decline in price, the Rubber Industry Replanting board in Malaya recommended that the 4½ Straits cents tax per pound on rubber produced in and exported from the federation for the special purpose of facilitating the replanting of small holdings should continue to be levied.

In the U.S. the General Services administration announced an end to exclusive government importing and supplying of natural rubber to U.S. manufacturers, and trading in futures was resumed on the New York commodities exchange on March 3. All government restrictions on the purchase and use of natural rubber were lifted and free trading in the U.S. was officially restored on July 1. Latex production in 1951 in long tons was: Malaya 60,386, Indonesia 9,750 (estimated), Ceylon 1,426, Vietnam and Cambodia 856, Liberia 13,505, for a total production of 87,500 long tons (dry weight). Consumption of latex in 1951 totalled 83,500 long tons (dry weight) three-fourths of which was used in the United States and in the United Kingdom. Incomplete statistics indicated that the 1952 latex production would be about 60% of the previous year's, but with consumption standing near 90% of that of 1951 a tight supply was expected before the year's end. In the U.S. the General Services administration declared a free market on latex June 10, after disposing of the stocks it held. The price of latex at the end of August was about 40 U.S. cents per pound dry weight.

Synthetic Rubber.—World production of all types of synthetic rubber for the first six months of 1952 (excluding the U.S.S.R. and satellite countries) was 467,944 long tons, of which the U.S. produced 427,425 long tons. In the U.S. the General

Table III.—U.S. Imports of Natural Rubber, Including Latex

Year	Quantity in long tons	Value
1947	711,513	\$318,232,361
1948	735,340	309,208,730
1949	660,551	240,312,274
1950	802,203	458,241,415
1951	734,456	808,780,598

Services administration removed the limitations on the use of new GR-S rubber on Jan. 1 but retained those on butyl rubber; and on March 8 the Reconstruction Finance corporation announced a 3 cents per pound reduction in the price of GR-S rubber, which thereafter remained at 23 cents per pound (to Oct. 1). Congress passed on June 16 a 21-mo. extension of the Rubber act of 1948. This act continued government ownership of the U.S. synthetic rubber industry until March 31, 1954, but required the Reconstruction Finance corporation to report by March 1, 1953, to the president and to the congress on a program to dispose of the \$750,000,000 synthetic rubber industry. The president was required to put this program into the form of a legislative recommendation by April 1, 1953. The problem of an adequate rubber supply was considered at length in the report to the president by the President's Materials Policy commission (q.v.).

During 1952 announcement was made that polymerizations run at 122° F. using a class of diazotized aromatic amines, such as the sodium salt of *p*-nitrophenyl diazonium hydroxide (Nitrazole CF), produced rubbers which were the equal of standard production "cold" (41° F.) rubber, thereby eliminating the need for expensive refrigeration equipment. A new type of rubber appeared during the year under the name Hypalon. This was made by treating polyethylene, itself not a rubber, with chlorine and sulfur chloride. This treatment results in a rubbery polymer which can be milled, compounded and vulcanized. The resulting cured rubber shows excellent resistance to ozone and light. Another new rubbery material under the name Hydropol, still in the experimental stage, was made by hydrogenation of polybutadiene. In a typical example, emulsion type polybutadiene with a Mooney viscosity of 25 is hydrogenated in 5% solution in cyclohexane at about 225° C., 500 lb. per square inch pressure, to a residual unsaturation of 20% using a high catalyst (probably nickel) concentration amounting to 25% weight on

the rubber. Hydropol, which can be milled, compounded and vulcanized, hardens at low temperatures, as in liquid nitrogen, but unlike polyethylene at that temperature it is not brittle. Investigation of the polyester urethane rubbers and the polyester amide rubbers continued. These are made by reacting a diisocyanate with a hydroxyl terminated polyester prepared from a dibasic acid (such as adipic) and a glycol (such as ethylene glycol) resulting in the Vulkollan type rubbers of Germany; or by reacting a diisocyanate with a polyester amide prepared from a dibasic acid (such as adipic) and a hydroxylamine (such as monoethanolamine) resulting in the Vulcaprene type rubbers of England. The vulcanized Vulcaprene rubbers had been used primarily as bases for flexible lacquers for coating ordinary rubber articles and as impregnating agents. The vulcanized Vulkollan rubbers show unusually high tensile strength, modulus and resistance to abrasion and tear, all without the necessity of added reinforcing pigment. The resistance of both types to ozone and swelling in hydrocarbon oils is of a high order.

Reclaimed Rubber.—World production of reclaimed rubber in 1951 was 447,564 long tons. U.S. consumption through June 1952 was 143,884 long tons, compared with 191,500 long tons for the same 1951 period.

Rubber Manufacturing.—In 1951 the total new rubber consumed in all countries reporting was divided into 35% synthetic and 65% natural, whereas in the U.S. rubber consumption was 63% synthetic and 37% natural. In the U.S., manufacturers continued development work using some of the newer synthetic fibres in an effort to improve the strength and serviceability of their products. An all-nylon cord tire appeared, although the use of nylon as shock shield material was introduced a few years before. Consumption of nylon by the rubber industry in 1952 was running at an annual rate of about 12,000,000 lb. compared with more than 400,000,000 lb. for rayon. Dacron was finding uses in industrial products where high strength and low bulk were desirable, as in high-speed belts. Its high temperature properties were being explored. Most U.S. tire companies were doing experimental work with steel tire cord.

In the U.S., tire production held up well during 1952. Total shipments of pneumatic casings in 1951 were 85,154,000 units (61,678,000 passenger and motorcycle; 16,764,000 truck and bus; 5,018,000 farm tractor and implement; 1,340,000 industrial pneumatics; 354,000 aeroplane). Shipments for the first seven months of 1952 totalled 53,246,990 units (41,108,167 passenger and motorcycle; 8,349,854 truck and bus; 2,787,511 farm tractor and implement; 700,615 industrial pneumatics; 300,843 aeroplane) as compared with shipments during the same 1951 period of 51,143,287 units (37,530,849 passenger and motorcycle; 9,539,001 truck and bus; 3,069,900 farm tractor and implement; 771,575 industrial pneumatics; 231,962 aeroplane). Tire inventories at the end of July 1952 stood at a total of 12,630,327 units as compared with those of the same 1951 period of 4,078,693 units. (See also PLASTICS INDUSTRY; RECONSTRUCTION FINANCE CORPORATION.)

Ruiz Cortines, Adolfo (1891–), Mexican president, was born on Dec. 30 in the state of Veracruz. He first rose to national political prominence when he became governor of Veracruz in 1944. When Alemán was elected president of Mexico in 1946, Ruiz Cortines became one of his most influential political aides and was later named minister of the interior. On Oct. 13, 1951, he was nominated

by the Partido Revolucionario Institucional (P.R.I.) to succeed Alemán as president. After his nomination he declared that he would continue Alemán's domestic policy of increased industrialization and his foreign policy of close Mexican-U.S. amity. He startled the nation, however, by denouncing one-party government (actually the P.R.I.) and official curtailment of the opposition's political liberties. On July 6, 1952, he was elected president by a huge majority, receiving an estimated 70%–80% of the approximately 5,000,000 votes cast. He took office on Dec. 1 for a six-year term.

Rulers: see PRESIDENTS, SOVEREIGNS AND RULERS.

Rumania. A people's republic of southeastern Europe, Rumania is bounded north and northeast by the U.S.S.R., east by the Black sea, south by Bulgaria and west by Yugoslavia and Hungary. Area: 91,654 sq.mi. Pop.: (1948 census) 15,872,624; (1951 est.) 16,200,000. Language (1948 census): Rumanian 85.7%; Hungarian 9.4%; German 2.2%; Yiddish 0.9%; other 1.8%. Religion (1947 est.): Greek Orthodox 81%; Greek Catholic 9%; Roman Catholic 7%; other 3%. Chief towns (pop., 1945 est.): Bucharest or Bucuresti (capital, 1948 census, 1,401,807); Cluj (110,956); Jassy or Iasi (108,987); Timisoara (108,296); Ploesti (105,114); Braila (97,292); Galati (93,229). Chairmen of the presidium of the grand national assembly in 1952, Constantin Parhon and (from June 2) Petru Groza; premiers in 1952, Petru Groza and (from June 2) Gheorghe Gheorghiu-Dej.

History.—On Jan. 27, 1952, a currency reform was introduced. The new leu was to be tied to the Soviet rouble, "the most stable currency in the world." Funds of state enterprises, co-operatives and collective farms were to be exchanged at the rate of one new leu to 20 old. Sums in cash and in savings deposits were to be exchanged at rates graded according to the amount. Cash sums of more than 3,000 lei were to be exchanged at one new to 400 old, deposits of more than 3,000 at one new to 200 old. The effect of the currency reform was to take from the peasants most of their savings.

During the winter the food supplies of the cities had been barely adequate. The drive against kulaks and confiscation of stocks of food in the villages had not solved the problem. There were still very few collective farms in Rumania. At the time of the currency reform the "Socialist sector" in agriculture held nearly 13% of the arable land, and this was mostly accounted for not by collective but by state farms. The bad supply position was the result of defects of the administration in industry as well as in the countryside, as well as to mistakes taken in calculations by the political planners. The Rumanian failures were attributed to kulak sabotage, which could not have been so successful had it not received protection in high places. The problem was of such large dimensions that nothing less than a major purge would satisfy the taskmasters in Moscow.

The first step was the dismissal on March 6 of three assistant ministers of finance. Three days later the minister himself, Vasile Luca, one of the three most eminent Rumanian Communists, was removed from his post. On May 27 both Luca and the minister of interior, Teohari Georgescu, were removed from their positions as vice-premiers. Their places were taken by two veteran trade unionist members of the Politburo, Gheorghe Apostol and Chivu Stoica. A statement issued after a plenary session of the central committee, held on May 27–28, declared that Luca had surrounded himself in the ministry of finance with enemies of the people. Luca had kept farm prices high in order to enrich the kulaks. He had failed to provide working capital to industry punctually. He had failed to pay the wage bill in the first half of January, thus depriving the workers of their

Running: see TRACK AND FIELD SPORTS.

Rural Electrification. In 1935, when the Rural Electrification administration was established by congress, 10.9% of all U.S. farms had central station electric service. In 1940 the percentage was 30.4. REA estimated that nearly 90% of the farms were receiving service on June 30, 1952.

Total loans of \$2,592,629,925 had been made by REA at the close of the 1952 fiscal year on June 30, and 1,209,000 mi. of REA-financed lines were in operation. The borrowers were serving a total of 3,770,000 consumers. During the year the borrowers had added about 75,000 mi. of line and 223,000 consumers to their systems.

REA was authorized by congress in 1949 to undertake a similar loan program to provide for the expansion and improvement of rural telephone service. Loans in both programs bore 2% interest, and were to be repaid in 35 yr.

Telephone loan allocations approved by REA at the end of the 1952 fiscal year had reached \$82,000,000 to 110 commercial companies and 80 co-operatives. The loans enabled the borrowers to provide area coverage telephone service to 250,000 rural subscribers in 39 states.

During 1952 REA installed experimental radio-telephone equipment in two areas to provide tests of new developments under actual operating conditions. In each case radio beams link an isolated party line with a fully automatic exchange. Subscribers anywhere on the whole system can dial any other subscriber without the services of an operator, in spite of the fact that no wires connect one part of the system to the rest. In one of the installations the equipment provides full selective ringing. Although there are eight parties on the line served over the radio beam, the only telephone that rings is the particular party called. This, too, is fully automatic; no human attendant

TV ANTENNA above a farmhouse in the Ozark hills in Missouri, an example of the spread of central station electric supply which was serving almost 90% of all U.S. farms in 1952

last instalment of their wages before the currency reform. Georgescu had failed to take measures against Luca's gang of "speculators exploiting the workers and the working peasants." The statement also severely criticized Ana Pauker, until then perhaps the most eminent Communist in Rumania. She was accused of deviating from the party line in agricultural policy. She had apparently shown both too little and too much zeal. She was held responsible for the delays in the creation of peasant associations and collective farms. She had also infringed the principle of free consent on the part of working peasants, and allowed force to be used in creating collectives. The statement declared that Luca, Georgescu and Pauker had formed a clique of three within the party leadership, and had co-ordinated their resistance to the party line. Luca was sent before the party control commission, Georgescu was demoted and assigned to salutary work, while Pauker was for the time being allowed to remain in the central committee though no longer in the Politburo. On July 5, however, she was removed from her office of minister of foreign affairs and was replaced by Simion Bughici, till then ambassador in Moscow.

Gheorghiu-Dej's authority was increased on June 2, when he assumed the premiership. Groza, who for seven years had held the title but not the powers of premier, became president of the republic, while the former president, Parhon, retired.

On July 18 the press published the text of a new draft constitution. Its main significance was as a statement of the political and social principles of the regime. From this point of view it marked one more stage toward the Soviet model. The constitution of 1948 already introduced institutions closely copied from those of the Soviet Union. The new constitution made few changes of substance, but its language was more thoroughly Stalinian. The main specific innovation was the establishment of a Hungarian autonomous region, with its centre at Targu Mures, and comprising the Szekely counties in the southeast corner of Transylvania, whose population was almost exclusively Hungarian.

The most striking event in the industrial field was a trial for sabotage, held at the end of August, of engineers engaged in the construction of the Black sea-Danube canal. The accused persons confessed that they had been under the influence of the U.S. espionage service, though neither they nor the prosecution claimed that they had ever been in contact with U.S. agents.

From March onward large-scale deportations took place, first from Bucharest and then from other cities. The victims were mostly members of the former middle class. (H. S-W.)

Education.—Schools (1950–51): elementary c. 14,000, pupils 1,795,000; secondary and technical, pupils 323,000; institutions of higher education 11, students 57,000. Illiteracy (1951): 10.6%.

Finance.—Budget: (old lei, 1951 est.) revenue 433,900,000,000, expenditure 429,900,000,000; (new lei, 1952 est.) revenue 32,108,000,000, expenditure 30,608,000,000. Monetary unit: leu (pl. lei) revalued on Jan. 28, 1952, with official exchange rates of 2.80 lei=1 rouble (as compared with the previous exchange rate of 37.40 lei=1 rouble) £1=31.36 lei and \$1=11.20 lei.

Foreign Trade.—(1950) Imports U.S. \$213,000,000; exports U.S. \$239,000,000. Main sources of imports (1950): U.S.S.R. 49%; Czechoslovakia, Poland, Hungary and Bulgaria 33.3%. Main destinations of exports: U.S.S.R. 58.2%; four eastern European countries 30.4%.

Transport and Communications.—Roads (1945): 43,163 mi., including 1,150 mi. modernized in 1947. Licensed motor vehicles (Dec. 1950): cars 14,000; commercial 12,000. Railways (1949): 7,363 mi. Shipping (1948): merchant vessels 15, net registered tonnage 32,962. Telephones (1950): 135,000. Radio receiving sets (1949): 226,000.

Agriculture.—Main crops (metric tons): maize (1948) 5,279,000; wheat (1948) 2,600,000; barley (1947) 360,000; oats (1946) 280,000; rye (1947) 66,000; potatoes (1949) 1,090,000. Sugar, raw value (1951) 110,000. Wine production: (1951) 4,000,000 hl. Livestock: cattle (1950) 4,950,000; pigs (1950) 2,300,000; sheep (1948) 7,088,000; horses (1948) 939,000.

Industry.—Persons employed in industry (Oct. 1947): 462,300. Fuel and power (metric tons, 1950 est.): coal 264,000; lignite 3,150,000; crude oil 4,360,000; natural gas 3,300,000 cu.m.; electricity 1,033,000,000 kw.hr. Raw materials (metric tons, 1950 est.): pig iron 190,000; steel ingots and castings 270,000; lead 6,000; zinc 3,800; cement 740,000.

is required except for periodic checking and servicing.

REA's 1,014 electrification borrowers included 987 rural electric co-operatives, 42 public power districts, 26 other public bodies and 25 commercial power companies. Four new rural power systems went into operation in 1952.

Of the \$165,426,000 new electrification loans approved during the 1952 fiscal year, 37% was for generation and transmission purposes. The percentage in 1951 was 23. In 1952 loans for such purposes accounted for 19% of all REA loans.

Emphasizing the need for additional power sources was a 22% increase in kilowatt hour consumption. The 10,700,000,000 kw.hr. distributed by REA borrowers during 1952 was about twice that distributed in 1949, and about five times the 1946 figure. During the fiscal year, \$137,929,105 in loan funds was advanced to borrowers to pay for electric line construction. This brought loan funds advanced to a cumulative total of \$2,054,591,865.

Principal and interest payments on REA loans continued to run ahead of schedule. In 1952, advance payments totalled \$46,000,000. Since the start of the program, \$362,000,000 had been paid on principal and interest, nearly \$68,000,000 more than the total amount advanced by REA during its first six years.

The contribution of rural power lines to the nation's mobilization effort was increasing in importance. Although there was a growing shortage of farm labour, production goals for food and fibre were at their highest in history. (R. Sd.)

Canada.—In a report issued in 1952, and covering the 1941–51 period, the Ontario hydroelectric commission stated that the number of rural customers served by the commission had increased by 25,795 in the ten years, to reach a grand total of 318,606 by Dec. 31, 1951. Therefore nearly 73% of the total number of Ontario farms listed in the 1941 federal census had electrical service. Quebec increased its provincial aid to rural electrification from \$15,000,000 to \$20,000,000. Indicative of the spread of rural power on the prairies was the extension of electrical lines to 275 farms in Saskatchewan in 1952; lines were going up for the service of 137 additional farms. (C. Cy.)

Rural Rehabilitation Loans: see FARMERS HOME ADMINISTRATION.

Russell, Richard Brevard (1897–), U.S. senator from Georgia, was born on Nov. 2 in Winder, Ga. He studied at the Agricultural and Mechanical school at Powder Springs, at Gordon institute in Barnesville and at the University of Georgia, where he took his law degree in 1918. After serving in the U.S. naval reserve in World War I, he began practising law in Winder, was elected county attorney and in 1921 was elected to the Georgia assembly. He remained there for ten years, serving as speaker from 1927 until his inauguration as governor for the 1931–33 term. In 1932 he was elected to the U.S. senate to fill an unexpired term, and he was re-elected in 1936, 1942 and 1948. He was a leader of the senate states' rights group, chiefly southerners, and opposed such measures as the Fair Employment Practices bill, the anti-lynching bill and the anti-poll tax bill. He was well known as a proponent of economy in government, and as early as 1943 he was on record as saying that the U.S. post-World War II policy was ill defined and that a closer check should be kept on materials going to the Allies.

Russell was the southern bloc's choice to run for the Democratic presidential nomination in 1952. Prior to the convention at Chicago, Ill., in July he conducted a vigorous campaign in northern as well as southern states. At Chicago he received 268 votes on the first ballot, 294 on the second and 261 on the third before conceding the nomination to Adlai E. Stevenson,

whom he agreed to support.

Russia: see UNION OF SOVIET SOCIALIST REPUBLICS.

Russian Literature. Criticism and self-criticism were particularly severe in the field of literature in 1952. Soviet writers were put in the dock during the Communist congresses of the 16 federated republics in September and were further reprimanded from the rostrum at the 19th Congress of the Communist Party of the Soviet Union (Moscow, Oct. 5–14).

The party continued to level the same reproaches at these "engineers of the spirit": they were not deriving sufficient inspiration from "soviet reality" or from the great achievement of the era of Joseph Stalin; they were idealizing the past, committing all kinds of ideological errors and lapsing into "bourgeois nationalism"; too many publications were commonplace or badly written or failed to respect "the truth of life"; novels and plays gave a one-sided and stereotyped view of present soviet society; too much concerned with technique, authors were forgetting man and neglecting to portray the conflicts and contradictions of his soul, the struggle taking place between the old and the new and between routine and progress. *Pravda* (in an article of April 7 on "The Backwardness of Drama") declared for the first time in recent years that there was room for satire in the country of socialism and launched a slogan that received much attention from the soviet writers' unions: "We need Gogols and Shchedrins!"

The Stalin prize jury emphasized this absence of good work: in March it found no play that deserved a first prize; and it awarded only one first prize for poetry (to Nikolay Tikhonov) and two for novels (to S. Zlobin for his historical *Stepan Razin* and to the Latvian author V. T. Latsis for his *To the New Shore*). As soviet authors fell short, the jury had for the first time to reward foreign writers, including the French Communist André Stil, a Hungarian and a Chinese.

Meanwhile the novels that got most praise from the party were: *The White Birch Tree*, by Mikhail Bubennov (the second volume of a work on World War II, covering the period between the checking of the Germans before Moscow and the Red army's victorious counteroffensive); *The Ninth Wave*, by Ilya Ehrenburg (a sequel to *Storm*, a vast survey of European history, 1948–51); *Bells of the Evening*, by Nikolay Virta (on Russian workers and peasants, showing how their revolutionary feelings were aroused at the beginning of the century); *Our Summer*, by Elena Uspenskaya (on student life); *The Zhurbins*, by V. Kochetov (on workers' life in a naval shipyard); *Birth of a Sea*, by Konstantin Paustovsky (the first novel on the artificial lake of Tsymlyansk and the building of the Volga-Don canal); and *The Metalworkers*, by A. Bylinov (a novel which readers in a Moscow factory found too technical and boring, according to the *Literaturnaya Gazeta* of Sept. 13).

More than 300 writers from all parts of the U.S.S.R. attended a conference on children's books (April 14–18). It was shown that there were about 250 writers for children and that since 1918 more than 39,000 works had been published, with a world total of 16,000,000,000 copies printed. The most popular writer, Samuil Marshak, had had 23,000,000 copies of his books printed, and they had been translated into 62 languages.

Works of literary history included: *Gogol*, by V. Yermilov; *Nikolay Dobrolyubov*, by V. Zhdanov (a work on the 19th-century democratic writer); *A History of 18th-Century Russian Literature*, by D. Blagoy; and some new books on Maxim Gorky, including A. Volkov's *Maxim Gorky and the Literary Move-*

ment at the End of the 19th and the Beginning of the 20th Century.
(A. PR.)

Rye. The smallest rye crop since 1870 was harvested in the U.S. in 1952. The 15,759,000-bu. crop was 26% below the 21,410,000 bu. of 1951 and 44% less than the average for 1941-50. The official production goal was 22,500,000 bu. Rye seeded for all purposes in the fall of 1951 was 3,164,000 ac., much below the 4,607,000-ac. average for the previous decade. Moreover, the 1,350,000 ac. retained for harvest in 1952 was the smallest on record, 22% below the previous year and only 43% of the planted acreage, compared with 51% normally retained. Heat and drought damage in the main producing area reduced average yields to 11.7 bu. per acre, compared with 12.4 bu. in 1951 and a 1941-50 average of 12.1 bu. South Dakota was the leading producer with about 3,300,000 bu. (6,656,000 bu. in 1951), followed by Minnesota, Nebraska and North Dakota.

The seeding goal for the crop to be harvested in 1953 was announced as 1,700,000 ac. An average yield of 12.4 bu. per acre would give 21,000,000 bu., enough for domestic requirements. Prices, supported at \$1.42 per bushel at the farm, averaged above \$1.75 per bushel.

Rye Production of the Principal Producing Countries
(In thousands of bushels)

Country	1952	1951	1950	Average, 1935-39
U.S.S.R.	114,000	119,450	910,000	885,000
Western Germany	24,911	17,647	13,333	9,191
Czechoslovakia	24,000	23,500	17,440	14,301
Canada	22,000	22,500	21,500	19,205
Turkey	20,810	18,030	16,570	20,394
Spain	19,500	20,000	24,000	29,993
Netherlands	18,300	18,100	17,240	20,611
France	15,759	21,410	22,000	44,917
Austria				
United States				

World rye production was preliminarily indicated at 1,565,000,000 bu., 5% below the 1,655,000,000 bu. of 1951-52 and 10% below the pre-World War II average of 1,732,000,000 bu. Much of the decline was attributed to the U.S.S.R.

(J. K. R.)

Saar. A German state (*Land*) united with France by monetary (from Nov. 20, 1947) and customs (from April 1, 1948) union. Area: 991 sq.mi. Pop. (1951 est.): 954,000. Language: German. Religion: Roman Catholic 75%, Protestant 24%. Capital: Saarbrücken (pop., 1939 est.) 135,000, (June 1947 est.) 97,752. High commissioner of the French republic, Gilbert Grandval; prime minister in 1952, Johannes Hoffmann.

History.—During 1952 the Saar became the hinge of Franco-German relations. On Jan. 27 Grandval became French ambassador to Saarbrücken. Although following logically from the conventions of 1950 the change caused an uproar in Germany where it was regarded as a French attempt to make permanent the political autonomy of the Saar. This autonomy made possible the economic union of the Saar with France upon which the French insisted as a condition of their participation in the Schuman plan, for only with the Saar mines and foundries did they feel that their own heavy industry could sufficiently counterbalance that of western Germany.

Elections to the Saar *landtag* fell due not later than Dec. 1952, and the Germans and pro-German Saarlanders hoped to make them into a pro-German demonstration against the autonomous regime. To prevent this, the existing *landtag* passed a law on March 17 forbidding the existence of political parties, such as the Democratic party (D.P.S.) suppressed in 1951, which were disloyal to the autonomous constitution.

Although the Saar Socialist party (S.P.S.) had left the Saar government in 1951, it seemed less and less able to retain support. In April the Saar T.U.C. (Trade Union congress) elected as its president a miner named Paul Kutsch, a rebel against

Industrial Production in the Saar

(In thousand metric tons)

*Six months. †Four months. ‡Five months.

the S.P.S. In May and August important groups of Socialists seceded, forming themselves into a new German Socialist party (D.S.P.) closely associated with the Social Democrats in Germany. On Sept. 7, with the possibility of imminent elections which the Germans now wished to postpone, the S.P.S. published a fresh program attacking the Franco-Saar conventions and declaring against tariff and passport barriers between the Saar and Germany.

The D.S.P. and a new pro-German Christian Democratic union (C.D.U.), founded in the Saar in June, more than once applied unsuccessfully to the minister of the interior for registration as parties. The Germans therefore complained to the Council of Europe that human rights were not respected in the Saar, but the complaint was rejected on Sept. 15.

The best hope for an agreed solution of the Saar dispute seemed to be to Europeanize the Saar territory within the European Coal and Steel Community. After abortive discussions in March, Franco-German conversations on this project began on July 25 in Paris and continued at intervals through August and September. The French, and naturally the Saarlanders, wished Saarbrücken to become the headquarters of the European Coal and Steel Community. (See also EUROPEAN UNION.) (E. Wl.)

St. Croix: see VIRGIN ISLANDS.

St. Helena. British colony in the South Atlantic with dependencies of Ascension (34 sq.mi.; pop., 1946 census, 292; 1951 est., 170) and Tristan da Cunha (45 sq.mi. including islets; pop., 1951 est., 270). Colony: area, 47.3 sq.mi.; pop. (1951 est.), 4,700. Language: English. Religion: Christian (90% Anglican). Capital: Jamestown (pop. 1,547). Governor in 1952: Sir George Joy.

History.—The new British company which had taken over the hemp industry in 1951 adopted a policy of land conservation and agricultural reform. The price of hemp fell from £170 to £63 a ton and much of the season's crop could not be sold; some mills had to close and unemployment resulted. In Tristan da Cunha the new crayfish-canning industry had a difficult 1951 season but improvement took place early in 1952 and prospects were hopeful. The island had a doctor, a nurse and an agriculturalist as well as an administrator, and its own stamps (St. Helena overprinted). (K. G. B.)

Education.—Schools (1951): 11 primary and 1 secondary (total attendance 1,251); 1 domestic science centre.

Finance and Trade.—Currency: sterling. Budget (1952 est.): revenue £116,139; expenditure £116,139. Foreign trade (1951): imports £163,605, exports £241,537 (mostly flax, of which 1,130 tons were produced). Live-stock: 2,780 sheep, 2,216 goats, 996 cattle, 7,205 poultry.

St. John: see VIRGIN ISLANDS.

St. Kitts-Nevis: see LEEWARD ISLANDS.

St. Laurent, Louis Stephen (1882-). Canadian statesman, was born on Feb. 1 at Compton, Que. He was educated at St. Charles college, Sherbrooke, and Laval university, Quebec, Que., and practised law until Dec. 10, 1941, when he entered federal politics. He was minister of justice and attorney general, later secretary of state for external affairs, and on Nov. 15, 1948, became

the 17th prime minister of Canada. He was first elected to parliament as Liberal member for Quebec East on Feb. 9, 1942, and was returned in the 1945 and 1949 federal elections. In Dec. 1951, upon the tenth anniversary of his entry into federal politics, there were parliamentary and other expressions of appreciation transcending political lines, which was unique in Canadian affairs.

During 1952 St. Laurent led the government in one regular session of parliament commencing on Feb. 28 and a second session commencing Nov. 20. Important legislation passed during the first session included measures for the control and extirpation of foot-and-mouth disease, authorization of the establishment of a national library, and ratification of a peace treaty between Japan and Canada. At the end of the year he attended a commonwealth economic conference in London. (See CAN-ADA.) (C. Cy.)

St. Louis. St. Louis, Mo., had a population of 856,796 by the 1950 census, with an additional 824,485 in the adjacent metropolitan area. Mayor in 1952: Joseph M. Darst, Democrat.

The municipal government found itself in financial distress at the beginning of 1952. It ended the fiscal year April 7 with a \$2,707,723 net deficit, and faced a rapidly mounting debt because of increasing expenses and lack of substantial new revenue. A dire financial stringency which would have crippled services and cut deeply into government personnel (which had received pay raises totalling \$1,100,000 a year) was fortunately evaded by a city earnings tax which was belatedly enabled by the Missouri legislature and enacted hesitantly by the board of aldermen.

The tax, which would yield \$7,500,000 a year, went into effect Sept. 1, 1952. It levied one-half of 1% on gross earnings of individuals and net corporate profits. With this help the administration hoped to show a small operating surplus in the 1952-53 fiscal year, with estimated receipts totalling \$43,981,788 against appropriations of \$43,941,111.

An additional \$1,193,248 revenue came from real estate taxes. Mainly because of new construction, the assessed valuation increased \$25,804,100 to an all-time high of \$1,137,456,180. The tax rate was increased from \$2.85 to \$2.89 per \$100 valuation.

Fares of streetcars and buses, privately owned, were increased basically from 15 to 17 cents with optional 65-cent weekly permits plus 10 cents a ride. This, the sixth fare boost in five years, gave the company an estimated \$2,275,000 additional yield yearly and set the administration thinking about some form of publicly owned transit.

The school board voted a \$400 salary boost, plus a scheduled \$200 automatic raise, to 3,000 teachers and 1,200 nonteaching employees. Washington university opened its classes to Negroes for the first time. The board of aldermen extended rent control to April 30, 1953. Policemen surprisingly voted two-to-one against the establishment of a police merit system. The chamber of commerce of metropolitan St. Louis finished an industrial dispersion plan to counter possible enemy air attack, the first such plan brought to completion in the United States. A powerful Democratic political organization, known locally as the Callanan-Shenker-Hogan machine, was soundly thrashed in the 1952 primary election. (E. L. R.)

St. Lucia: see WINDWARD ISLANDS.

St. Pierre and Miquelon. This group of eight small islands off the south coast of Newfoundland constitutes a French overseas territory. Area: 93 sq.mi. Pop.: (1945 census) 4,354; (1951 est.) 5,000. Language:

French. Religion: Roman Catholic. Chief town, St. Pierre (pop. 1945, 3,636). Administrator in 1952: Irénée Davier.

History.—A new general council took office in 1952; the retiring senator was re-elected.

The Société de Pêche et de Congélation, which had been founded with state aid, was made responsible for the cold-storage plant. Some of the frozen fish were to be sold in North America. Progress was made on the fur farms. A seal-hunting company was founded. A specialist in lung surgery was put in charge of the campaign against tuberculosis. As a result of regular services by sea to and from Newfoundland, about 1,000 tourists were able to visit the islands.

Education.—Pupils (1952): primary 1,067; secondary and technical 118 Bursaries in France 11.

Finance.—Budget (1952 est.): balanced at 283,000,000 fr. C. F. A. Monetary unit: the franc (Colonies Françaises d'Afrique) is used; 1 franc C. F. A.=2 metropolitan francs. In 1952, U.S. \$1=350 metropolitan francs.

Foreign Trade.—(1951) Imports 410,000,000 fr. C. F. A. (incl. 108,000,000 fr. C. F. A. from France and 220,000,000 fr. C. F. A. from Canada); exports 128,000,000 fr. C. F. A. (incl. 75,000,000 fr. C. F. A. to the Antilles), mainly cod 98,000,000 fr. C. F. A. and silver fox skins 4,000,000 fr. C. F. A.

Communications.—(1951) Ships entered 163.

Salvador, El. A republic on the Pacific coast of Central America, the smallest but most densely populated country on the isthmus, El Salvador has an area of 13,176 sq.mi. and a population (1950 census of the Americas) of 1,858,656; (1951 est.) 1,920,000. The capital is San Salvador (pop., 1948, 124,266). Other principal cities are: Ahuachapán (14,666), Chalchuapa (10,300), Cojutepeque (16,210), Nueva San Salvador (25,684), San Miguel (19,339), San Vicente (14,623), Santa Ana (51,351), Sonsonate (18,898), Suchitoto (10,619), Usulután (9,590) and Zacatecoluca (11,684). Language: Spanish. Religion: predominantly Roman Catholic. President in 1952: Lieut. Col. Oscar Osorio.

History.—The government's economic and administrative reform program continued throughout 1952. In elections for a new national assembly in May, the government's Revolutionary party was unopposed. More than 700,970 votes were cast. A new income tax measure which entered into force at the beginning of the year established levies up to 44% on incomes higher than \$60,000 and provided for a 5% tax on profits of all locally domiciled businesses. The national budget for 1952 came to \$53,000,000, of which \$14,000,000 was set aside for education and social welfare and \$8,000,000 for public works projects. (G. I. B.)

Education.—In 1950 there were 1,832 primary schools with 4,840 teachers and 145,226 pupils and 99 secondary schools with 7,231 students. The national university had 1,120 students and 147 faculty members in 1949. About 16% of the 1952 budget was allocated to public education. In 1951 there were 30 motion-picture theatres with seating capacity of 40,782.

Finance.—The monetary unit is the colón, valued at 40 cents U.S. currency in 1952. The 1952 budget was placed at \$53,000,000 (1951: \$44,000,000). In 1950 ordinary governmental expenditure was \$35,395,579; revenue, \$35,347,019. The public debt as of Dec. 31, 1951, was \$9,538,585, all of which was external. On Sept. 30, 1952, currency in circulation totalled 80,260,000 colones; demand deposits 67,860,000 colones; gold reserves \$29,470,000; foreign exchange \$30,930,000; time deposits 1,660,000 colones; government deposits 17,570,000 colones.

Trade and Communications.—Exports in 1951 totalled \$85,529,736; imports (preliminary figures), \$66,583,514. Leading exports were coffee (89%), sugar, balsam, gold and silver. Principal customers were the U.S. (86%), Honduras (2%), Nicaragua (2%) and Italy (2%). The U.S. supplied about 62% of the imports; other important suppliers were Honduras, Nicaragua and the United Kingdom.

The two principal railroads have 385 mi. of main-line track, all narrow gauge. In 1950, 3,403,261 passengers and 458,760 short tons of freight were carried. National highway mileage (1950) was 1,693, of which 934 mi. were all-weather. The two international air lines made 3,535 flights into El Salvador.

Agriculture.—In the 1950-51 season coffee production totalled 1,111,855 bags of 132 lb. each; exports in 1951 were 1,086,214 bags, most of which went to the U.S. Centrifugal sugar production (plantation) was 29,000 short tons in 1950-51; sesame seed 4,600 tons; maize 156,000 tons; cotton (ginned) 6,500 tons; tobacco (1951-52) 1,900,000 lb. Exports of balsam, of which El Salvador is the chief source, were 152,000 lb. in 1951. There were an estimated 800,000 cattle, 350,000 pigs and 22,000 sheep and goats in 1950.

Mineral Production.—In 1951, 27,100 troy oz. of gold and 351,800 oz. of silver were produced. (J. W. Mw.)

Salvation Army. The Salvation Army, a religious and charitable organization, operated during 1952 in 87 countries and territories throughout the world. Its 26,747 officers and cadets, assisted by several hundreds of thousands of lay members, preached the Gospel of Christ in more than 80 languages and dialects. The international leader of the Salvation Army was Gen. Albert Orsborn, whose headquarters were in London, Eng.

The activities of the Salvation Army in the United States were directed by Commissioner Ernest I. Pugmire, national commander, and four territorial (area) commanders. Local leadership was given by more than 5,000 commissioned officers. There were 1,340 corps, or centres of evangelism and religious instruction for young people.

During the year, the Army's disaster service units were called into action in such catastrophes as the West Frankfort, Ill., mine explosion, the Arkansas tornado, and the Bakersfield, Calif., earthquake. Salvation Army canteens, manned by officers and volunteers, were usually on hand a short time after disaster struck, ready to supply the traditional hot coffee, sandwiches and donuts to victims and to rescue workers. Salvationists throughout the country also contributed money and supplies for the relief of hurricane, flood and war sufferers in other parts of the world.

As one of the member agencies of American Relief for Korea, Inc., the Salvation Army participated in numerous clothing campaigns and other drives for the collection of relief supplies to be sent to that country. Developments in Korea were also responsible for increased activity in the Salvation Army's Service to the Armed Forces program. As one of seven member

MEMBERS of the Seekers group, a self-help organization sponsored by the Salvation Army, operating much like Alcoholics Anonymous. A member is shown "testifying" on his former way of life and the means by which he was able to cure himself of alcoholism

agencies of the United Service Organizations, Inc., the Salvation Army responded to servicemen's spiritual and leisure-time needs by providing U.S.O. clubs and other facilities in more than 30 communities throughout the U.S. and Hawaii. In addition, the Salvation Army had extended its Red Shield program to include more than 50 drop-in centres and canteens for the use of the men and women of the armed forces.

In recognition of its religious and recreation program in more than 140 veterans hospitals throughout the country, the Salvation Army was presented in May 1952 with the award for meritorious service, by the VA administrator, Maj.-Gen. Carl Gray, Jr.

During the year, the Salvation Army in the U.S. held 97,732 street-corner meetings which attracted almost 1,000,000 persons. In its social service program, 19,609 persons were treated in seven clinics and dispensaries; 9,200 patients were admitted to the five general hospitals; 1,658 missing relatives and friends were located by the four missing persons bureaus; 34 maternity homes and hospitals cared for 16,300 women and infants; more than 50,000 mothers and children were sent to summer camps; and the four employment bureaus assisted 47,734 people in finding jobs in other than Salvation Army institutions. A total of 107 men's social service centres provided shelter and work for 30,155 men.

In the field of prison work, 7,842 prisoners were assisted on discharge and given employment; 2,092 prisoners were paroled in care of the Salvation Army, whose officers devoted 7,671 hr. to prison visitation. (See also CHURCH MEMBERSHIP.)

(E. I. P.)

Samoa, American. The Samoan Islands extend from lat. 13° 26' to 14° 22' S. and from long. 168° 10' to 172° 48' W. and are about 2,700 mi. E. of Australia and 2,200 mi. S. of the Hawaiian Islands. American Samoa consists of the inhabited islands of Tutuila, Tau, Olosega, Ofu and Aunuu, and the uninhabited coral atoll Rose Island. Swains Island, 210 mi. N.W. of Tutuila, was made a part of American Samoa in 1925. Total area of American Samoa is 76 sq.mi. and total population on Aug. 1, 1952, was estimated at 17,600, a reduction from the previous year's count resulting from the migration of about 1,000 natives to Hawaii. About four-fifths of the population lives on the main island of Tutuila. Pago Pago, on Tutuila, is the capital.

History.—American Samoa is an unorganized United States possession administered until July 1, 1951, by the U.S. navy. By order of Pres. Harry S. Truman, administration of American Samoa was transferred to the jurisdiction of the department of the interior on July 1, 1951. On Feb. 23, 1951, Phelps Phelps, former New York state legislator, was appointed governor. He resigned in 1952 and was succeeded by John C. Elliott, who had been secretary of American Samoa. Leland P. Draney was appointed secretary in 1952.

American Samoa has a bicameral legislature consisting of the house of representatives, with 54 members popularly elected for two-year terms, and the house of *Alii*, with 12 members. The legislature has advisory powers. The governor also has an advisory council consisting of from five to seven Samoans. Each of the three administrative districts has a native governor appointed by the governor of American Samoa. They in turn appoint village chiefs. The judiciary consists of a high court, district courts and village courts.

Education.—Education is compulsory for all children from 7 to 15 years of age, inclusive. It was estimated in 1950 that 93% of all persons 10 years of age or older were literate. As of June 30, 1952, there were 3,861 children enrolled in 53 public schools with 179 teachers, principals and other school personnel, and 1,255 children enrolled in 7 private schools with 35 teachers. Of the public schools, 46 were elementary, 5 junior high, 1 senior high and 1 vocational.

Production and Trade.—The economy of American Samoa is basically on a subsistence level. The main products of American Samoa are copra and

native handicraft, principally pandanus mats and rugs woven from grass. Principal crops, with estimated 1950 production, were copra (2,403 metric tons), breadfruit (7,700 metric tons), bananas (19,492 metric tons) and taro (2,900 metric tons). There were approximately 200-250 cattle and 200-250 horses in American Samoa in 1951. Imports in the fiscal year ending June 30, 1952, totalled \$1,110,563, of which the United States was the source for about 55% and Australia and New Zealand for about 40%. Exports totalled \$366,106, of which two-thirds were copra. Total revenues collected during the 1951-52 fiscal year amounted to \$648,173, in addition to a United States government appropriation of \$563,104; expenditures amounted to \$1,324,327. The Bank of American Samoa, which is a government institution, operated by the American Trust company, San Francisco, Calif., is American Samoa's only banking institution. As of June 30, 1952, it had a capital of \$50,000, a surplus of \$65,000, and undivided profits of \$33,665. Its gross earnings in the 1951-52 fiscal year totalled \$36,306.

Transportation.—Tutuila has 65 mi. of roads, 50 mi. of footpaths, and a 6,000-ft. coral-surfaced airstrip, no longer in use. (S. Nr.)

Samoa, Western: see NEW ZEALAND; TRUST TERRITORIES.

San Francisco. The population of the city and county of San Francisco on April 1, 1950, according to the 1950 U.S. census, was 775,357, compared with 634,536 in 1940. Estimates for the population of the city of San Francisco on Jan. 1, 1953, ranged between 795,000 and 800,000. The mayor in 1952 was Elmer E. Robinson, elected for a four-year term commencing Jan. 8.

San Francisco business activity appeared to be on the road to achieving a new annual high during 1952, based on industrial development, retail trade, financial transactions, consumption of electrical energy, water and industrial and commercial gas, air traffic and intercity vehicular traffic through the San Francisco gateways.

New industries and expansions were making rapid strides. The San Francisco bay region registered \$100,000,000 in outlays for industry during the first eight months of 1952. This amount exceeded any previous similar period and was well on the road to an estimated \$150,000,000 for the full year.

A whole series of service developments including public utilities, schools, churches, transit facilities, communications and street and highway improvements was under way during the year. The people of San Francisco had authorized \$189,000,000 in bond issues since Aug. 1945, and the municipal properties had expanded in value by \$120,000,000. The city planning department early in 1952 listed proposed projects of \$180,000,000 for the next six years. These municipal improvements were in addition to approximately \$400,000,000 which had been authorized in private construction in San Francisco since Aug. 1945. Of the private construction, about \$181,000,000 was new residential providing 21,000 dwelling units; nonresidential construction accounted for about \$120,000,000 and the balance came under additions, alterations and repairs, divided approximately one-third for residential and two-thirds for nonresidential.

The San Francisco tax rate for the fiscal year 1952-53 was \$5.67 per \$100 assessed valuation. The assessment roll amounted to \$1,825,291,170. Estimated fiscal year revenues amounted to \$169,085,667, of which \$69,452,475 came from city taxes. The San Francisco bonded debt limit as of June 30, 1952, based on the 1952-53 assessment, amounted to \$219,034,940. Bonds outstanding not matured on June 30, 1952, amounted to \$187,743,000. The margin for future bond sales amounted to \$109,729,940. Bonds authorized but unsold as of June 30, 1952, amounted to \$50,160,000.

(R. B. KR.)

San Marino. A small republic in central Italy, San Marino is entirely surrounded by the province of Emilia and is situated on the slopes of Monte Titano, 14 mi. S.W. of Rimini. Area: 38 sq.mi. Pop. (June 30, 1951, est.): 12,969. Language: Italian. Religion: Roman Catholic. San Marino is governed by two *capitani reggenti* appointed every

six months by a grand and general council of 60 members elected by universal suffrage every four years.

History.—On Feb. 5, 1952, the government asked the United Kingdom government to settle a claim for £420,000 in compensation for war damage caused in June 1944 by an air raid allegedly carried out by the royal air force. On June 3 the British foreign office, through its vice-consul at Florence, It., sent a reply denying any British responsibility, but offering an *ex gratia* payment of £26,000 to be accepted by July 3. On June 25 the regents Domenico Morganti and Mariano Ceccoli wrote directly to Queen Elizabeth, in Latin, protesting against the £26,000 offer as "mortifying and inadequate." On Aug. 21 the foreign office replied that although the *ex gratia* offer of £26,000 had lapsed, the San Marinese government could apply for it again if they wished.

Luigi Gozi, San Marino's treasurer, revealed on July 3 that the republic's deficit amounted to 500,000,000 lire (about £285,700). It was also reported that civil servants had not been paid for 15 weeks.

Finance.—Budget (1951-52 est.): provisionally balanced at 570,411,538 lire. San Marino uses Italian currency.

Santo Domingo: see DOMINICAN REPUBLIC.

São Tomé: see PORTUGUESE OVERSEAS TERRITORIES.

Sarawak: see BRITISH BORNEO.

Saskatchewan. Central of the three prairie provinces of Canada. Saskatchewan was created in 1905 by act of parliament. Area: 251,700 sq.mi. of which 13,725 are water. Pop.: (1951) 831,728. Capital: Regina (pop. 1951) 69,928.

History.—The 4th session of the 11th provincial legislature was used largely as a pre-election sounding board by both the Co-operative Commonwealth (Socialist) government and the Liberal opposition. The most significant legislation of 1952 included the approval of a new five-year federal-provincial tax agreement, abolition of the fiat previously required before a person could sue the crown and upward revision of the legal wage requirements. When the votes of the June 11 general election were counted, the C.C.F. had materially improved its legislative position: it had 42 seats compared with 31 upon dissolution; the Liberals had only 11 compared with 19; 2 independents failed to get returned.

The 12th legislature had 53 seats compared with 52 for the 11th, because the 1951 Redistribution act added a new northern constituency.

Education.—A federal survey revealed that Saskatchewan was spending 15.8% of its income on education. It was the smallest percentage of all the ten provinces.

Health and Welfare.—The same federal survey revealed that Saskatchewan was spending 32% of its total income on health, which was the largest provincial percentage. The Workmen's Compensation act was extended to include tuberculosis, brucellosis and Newcastle disease as occupational diseases.

Transportation.—The government reported that in the 1944-51 period it had built 735 mi. of hard-surface roads. Total expenditures on highways during the period were \$45,460,907. In 1952, 778 mi. were graded, 1,000 mi. were gravelled and 229 mi. were hard-surfaced, bringing the total hard-surface mileage to 1,044. There were 85,000 telephone subscribers, an expansion of nearly 50% since 1947.

Finance.—The budget for 1952-53 estimated \$65,922,580 in revenue and \$65,873,390 in expenditures. In the 1944-51 period the province had undertaken capital expenditures totalling \$78,071,794. On Dec. 31, 1951 the provincial debt stood at \$151,639,999.

Agriculture.—In 1951 Saskatchewan farms yielded an all-time high of \$622,000,000 of cash income. Intensive drying efforts, aided by a warm 1952 spring, saved about 285,000,000 bu. of grain which had been caught by early autumn snowfalls in 1951.

An outbreak of foot-and-mouth disease disrupted the Saskatchewan cattle industry.

Forestry.—An interim report of a forest survey committee indicated there were not less than 16,000,000 cords of readily available black and white spruce pulpwood in northern Saskatchewan, instead of the 2,500,000 cords previously estimated. The survey was only 60% complete in 1952 and the expectation was that when it was finished in 1954 about 30,000,000 cords of pulpwood would have been found.

Industry.—The government reported that its 15 crown companies made a

gross profit of \$4,405,000 in 1951. In 1952 about \$350,000,000 of new industrial capital was invested in Saskatchewan. With the employment index at 100 in 1939, and average weekly wages at \$24.18, industrial activity had increased until in July 1952 the index was 161.2 and wages were \$51.03.

Minerals.—The appointment of an oil and gas conservation board revealed the extent of the 1951–52 petroleum boom. In 1951, 85 companies spent \$20,000,000 on exploration and development; in 1952, 70 companies spent \$30,000,000. In 1951, 1,250,000 bbl. of crude oil were produced, compared with 1,000,000 bbl. in 1950. More than 700 claims were staked and recorded in the uranium rush at Beaverlodge and Black lakes in northern Saskatchewan. (C. Cy.)

Saudi Arabia. This is an independent Arab kingdom covering three-quarters of the Arabian peninsula. Area: c. 597,000 sq.mi. excluding the Rub' al-Khali desert covering c. 193,000 sq.mi. Pop. (no census ever taken; 1951 est.) 6,000,000. Chief towns: Riyadh (cap., 60,000); Mecca (150,000); Medina (45,000); Jedda (40,000); Hufuf (31,500). Ruler, King 'Abd-al-'Aziz ibn 'Abd-al-Rahman ibn Sa'ud; viceroy of Nejd and commander in chief, Amir Sa'ud, crown prince; viceroy of Hejaz and minister of foreign affairs, Amir Faisal, the king's second son.

History.—In Jan. 1952 King Ibn Sa'ud addressed Egyptian King Farouk and Mustafa el Nahas Pasha (then the Egyptian prime minister), suggesting means for the solution of Anglo-Egyptian differences; later Saudi Arabia, as a member of the Arab league, ratified the Arab security and economic pact.

In February the Arabian American Oil company announced that it was transferring its operating headquarters from New York city to Dhahran in Saudi Arabia. The output from the company's oil fields in the Hasa province of Saudi Arabia, which had been stepped up to offset the loss of supplies from the Anglo-Iranian oil fields, was maintained in 1952 and showed an increase over the 1951 production figures of approximately 25%.

In July the Saudi Arabian government set up an official monetary agency in Jedda. Its objects were to strengthen and stabilize Saudi Arabian currency and to fix its foreign exchange rates, and to help the finance ministry by centralizing government receipts and by controlling budget expenditure. Its authorized capital of 500,000 gold sovereigns was to be provided by the government and its board of control would be appointed by the king on the nomination of the minister of finance. It was announced in August that George A. Blowers, U.S. finance expert, had been nominated as its first governor.

In May it was announced that the king of Saudi Arabia had ordered that the existing railway from Dammam on the Persian gulf to Riyadh, the capital (556 km., which were covered in nine hours), should be extended westward from Riyadh to Medina and on to Jedda. The extension would be of 1,200 km. Construction, it was estimated, would take four years. This trans-Arabian service was expected to assist pilgrim traffic from the far east considerably.

Other projects announced during 1952 included an irrigation scheme using surface water in the district of the Hejaz province of Saudi Arabia and the exploitation of newly discovered wells in central Arabia to supplement the water supplies at Riyadh. A tannery was to be erected in Jedda under British management. (O. M. T.)

Savings Banks: see BANKING.

Sawyer, Charles (1887–), U.S. secretary of commerce, was born on Feb. 10 in Cincinnati, O. He studied at Oberlin college, Oberlin, O., and at the University of Cincinnati, and was admitted to the bar in Ohio in 1911. The same year he was elected to the Cincinnati city council. From 1921 on he was a member of the law firm of Dinsmore, Shohl, Sawyer and Dinsmore. He served as lieutenant governor of Ohio beginning in 1933, and won the Demo-

LOCUSTS SWARMING over the headquarters of the Arabian American Oil company in Dhahran, Saudi Arabia, as employees used homemade noisemakers to beat off the pests from lawns and shrubs. The 1952 locust plague in the middle east extended from Libya to Pakistan

cratic nomination for governor in 1938, but was defeated in the election by John W. Bricker. In 1944–45 he served as U.S. ambassador to Belgium and minister to Luxembourg. He became secretary of commerce on May 6, 1948.

In 1951 Secretary Sawyer was under the fire of Sen. Herbert R. O'Connor (Dem., Md.) on charges that Sawyer had not halted exports to red China until O'Connor's senate commerce subcommittee had virtually forced him to do so. He was also the centre of legal action to force him and other U.S. officials to return the American President lines to the R. Stanley Dollar interests, he having been instructed by Pres. Harry S. Truman not to do so. (The case was settled out of court June 10, 1952, by an agreement providing for public sale of the company's stock.)

Sawyer technically was operator of the \$7,000,000,000 U.S. steel industry from April 8, 1952, when it was seized by the government, until June 2, when the seizure was ruled unconstitutional by the U.S. supreme court.

Schuman, Robert (1886–), French statesman, was born in Luxembourg. June 29, of a Lorraine family. Called to the bar in Metz before World War I, he was elected deputy for the recovered *département* of Moselle in 1919 and was afterward continually re-elected. On March 21, 1940, he was appointed undersecretary of state in the Paul Reynaud cabinet (a post which he kept after the armistice) and was responsible for the refugees from Alsace-Lorraine. When the Germans in Sept. 1940 started the expulsion of Lorrainers from the Moselle, Schuman was arrested by the gestapo and sent to Germany in April 1941 for protesting, but he escaped in Aug. 1942 and went into hiding in France. Again elected deputy of the Moselle in Oct. 1945, and later re-elected, he joined the M.R.P. (Mouvement Républicain Populaire). He was minister of finance in the Georges Bidault (June–November 1946) and Paul Ramadier (Jan.–Nov. 1947) cabinets. On Nov. 22,

1947, he was nominated by the national assembly to form a new government. He resigned on July 19, 1948, and joined the André Marie cabinet as foreign minister. On Aug. 31 he was again the head of a government that lasted only seven days. On Sept. 11 he became foreign minister in the Henri Queuille cabinet and was reappointed to this post in seven following cabinets. In a statement published on May 9, 1950, he launched what was described as the Schuman plan, which was aimed at the formation of a European Coal and Steel Community; on April 18, 1951, the plan became a treaty and he signed it on behalf of France. On May 26, 1952, at Bonn, Ger., he signed the "convention on relations between the three powers and the Federal Republic of Germany" and the next day, in Paris, a treaty establishing the European Defense Community.

Sculpture. In view of its unexpected repercussions, the outstanding event of the year in sculpture was the exhibition "American Sculpture, 1951," presented by the Metropolitan museum, New York city, through Feb. 1952. This exhibition was the sequel to a similar large survey of current American painting held the previous year, which also generated controversy. It included 101 sculptures selected from about 5,000 photographs of work by approximately 1,100 sculptors. Awards totalled \$8,500. First prize went to Minna Harkavy for "Two Men," second prize to Rhys Caparn's "Animal Form I," third prize to Abbott Pattison's "Striding Man" and fourth prize to Joseph L. Greenberg, Jr., for "Eve."

Although the method of jurying and the personnel of the jury were carefully planned, the exhibition pleased few. It was condemned by the New York art press for its complement of dull or banal academic work, especially well illustrated by the inclusion of Paul Manship's gigantic study of two young soldiers, "Buddies," and also for the selection of numerous "modern" works which were superficial, derivative and incompetent in craftsmanship. (See also Lloyd Goodrich in *Art Digest*, March 1, 1952.)

The trend toward open-work sculpture continued in 1952, and also the use of metals and welding, as in "direct steel" sculpture. Such artists as Jacques Lipchitz, Alberto Giacometti, Alexander Calder, Henry Moore, Theodore Roszak and David Smith were among the most highly honoured and frequently exhibited and imitated.

At the Venice (It.) Biennale, the major sculpture exhibition of the year in Europe, the American section presented Calder alone, who won the President's prize for sculpture and proved a feature attraction. The French stressed Lipchitz and Émile-Antoine Bourdelle. The Italian sculptors Marino Marini, Alberto Viani and Luciano Minguzzi won prizes. At the U.N.E.S.C.O. (United Nations Educational, Scientific and Cultural organization) conference in Venice, accompanying the Biennale, which was dedicated to a study of measures to assure the freedom of the artist, Henry Moore led the section on sculpture.

One of the major American exhibitions of the year was "Sculpture of the Twentieth Century," organized by the Museum of Modern Art, New York city, with the collaboration of the Philadelphia (Pa.) Museum of Art and the Art Institute of Chicago (Ill.). Presenting more than 90 works from Auguste Rodin to the present, it opened in Philadelphia in October and was to continue in Chicago and New York city during most of 1953. In an earlier exhibition at the Museum of Modern Art, entitled "Fifteen Americans," the open-work metal sculpture

"GIRAFFE," a combined stabile (the sheet-metal body) and mobile (the light-as-air tail) by Alexander Calder, who was given first prize as the best foreign sculptor at the 1952 international art show in Venice, It.

of *avant-garde* artists Richard Lippold and Herbert Ferber was presented, and wood construction by Frederick J. Kiesler.

Among the many vigorous Italian sculptors, Marino Marini had been known and admired in America for several years. In 1952 Pericle Fazzini was given his first one-man show in New York city and made a hit with his small bronzes in a multitude of awkwardly graceful poses.

At the Pennsylvania Academy of the Fine Arts' 147th Annual Philadelphia, the first prize in sculpture went to Lipchitz, "Prometheus Strangling the Vulture." Like the Metropolitan exhibition, the other large annual surveys of American sculpture were not generally well received.

(See also ART EXHIBITIONS.)

(L. D. L.)

Great Britain.—Much interest was aroused by the position of Jacob Epstein, who received a retrospective exhibition during 1952 at the Tate gallery, London. His most recent work, the *maquette* for the large-scale "Madonna and Child" for the Convent of the Holy Child Jesus in Cavendish square, London, indicated that Epstein was continuing his attempt to convey general ideas in sculptural form. If this was not to be rated as one of his most successful works, the exhibition as a whole stressed that he remained one of the most powerful of modellers. In particular, his sculpture of Negroes demonstrated his solid appreciation for richly contrived figures, as well as his affection for firmly worked material. Henry Moore showed dissatisfaction with the plain statement of fact and a determination to reveal some of the inner meanings of existence, though he made no important contribution during the year. It was apparent in his art that he wished to enliven the ponderous forms of his human figures by an examination of some of the passions that direct existence. His sense of the evil within nature, which had appeared of late, related him to the painter, Francis Bacon. This trend lay less in the route of the now fashionable realism, and more toward symbolism.

Although men such as Lynn Chadwick, F. E. MacWilliam, R. Butler, Kenneth Armitage and William Turnbull proceeded along different paths, certain similarities of style and approach were noticeable. All these sculptors tended to avoid the treatment of the human form in the round and to fasten on its outline. Their favourite mediums proved to be iron, stone, wood and wire. With a few exceptions they avoided the monumental, concentrating on small figures or constructions, which rarely yielded pleasure to the touch. Their statements were linear rather than colouristic; cerebral rather than sensual. MacWilliam showed in certain of his works a return to naturalistic portraiture; in his dancing figures he attempted to convey the shock of the impact of two bodies. If the movement as a whole was still in reaction against Rodin, the investigation of movement, in terms of solid or nearly solid figures (as shown by MacWilliam's sculpture) no less than the symbolical content, suggested a feeling for the French master. Their sculpture proved well suited to the expression of states of mind: one critic called their figures and forms "waifs," and the sculptors' sense for desolation and poverty was translated in the material, which was often thin and gray. A similar lack of feeling for material (which may in part be attributed to the economic conditions of the time) was shown in France, where Germaine Richier proved successful with her gaunt, dramatic figures, which stemmed from Alberto Giacometti. Certain other sculptors—Alberto Viani in Italy, Emilio Greco in Greece and Marina Nuñez del Prado in Latin America—adhered to a more Mediterranean style and showed a warm affection for their material. A feeling for the surface play of objects, especially in wood, was displayed by Barbara Hepworth, and in her concern to give the silhouette form—memory of objects seen in nature—the touch of the hand was confirmed and retained.

This same sense for the properties of stone marked certain experiments in ornamentation undertaken by the painter Nicolas de Stael, who in his selection of material and in his work upon it showed the influence of Romanesque sculpture. (D. Sn.)

percentage of current consumption requirements and thus conserves the supply of primary metals. The latest production data available are shown in Table I, as reported by the U.S. bureau of mines.

Iron and Steel Scrap.—Since about half of the charge of the modern steel furnace is scrap, the scrap supply is usually short in periods of heavy demand for steel. In general, about half the supply is new metal, produced in the plant, and the other half is purchased scrap, recovered from broken, worn-out or obsolete equipment. Roughly, about one-fourth of each year's steel output represents scrap collected from the pool of metal in use.

(G. A. Ro.)

Secret Service, U.S. The major functions of the U.S. secret service, under direction of the secretary of the treasury, are protection of the person of the president of the United States, members of his immediate family, of the president-elect and of the vice-president at his request; the detection and arrest of persons committing any offenses against obligations and securities of the United States; the detection and arrest of persons violating certain laws relating to the Federal Deposit Insurance corporation, federal land banks, joint-stock land banks and national farm loan associations, as specified in 18 U.S.C. 3056; and the detection and arrest of any persons violating any laws of the United States directly concerning official matters administered by and under direct control of the treasury department.

The secret service also directs activities of the White House police force, which protects the executive mansion and grounds; and of the uniformed force, which protects the treasury building and other buildings housing treasury department activities, and the currency and other obligations and securities of the United States in production, storage and transit.

Although counterfeiting took a downward trend during the fiscal year ending June 30, 1952, as the result of several arrests of counterfeiters in Chicago, the public lost \$374,002 in counterfeit bills and \$5,860 in counterfeit coins passed on unsuspecting merchants and cashiers. In addition, the secret service captured \$393,802 in counterfeit bills and \$267 in counterfeit coins before they could be circulated, and arrested 279 persons for violating the counterfeiting laws. Agents seized nine plants responsible for the manufacture of 17 issues of counterfeit bills.

The forgery and fraudulent negotiation of government checks continued to be more than a \$2,000,000 racket. The secret

service received 28,586 forged checks for investigation and completed 30,091 forged check cases involving \$2,385,750.50. Special agents arrested 2,144 persons for check forgery.

Forgeries of stolen savings bonds added to the enforcement burden of the secret service, which received 4,227 forged bonds for investigation and closed 4,900 cases representing \$379,208.85. There were 105 persons arrested for bond forgery.

In addition to counterfeiters and forgers, the secret service arrested 159 persons for other crimes, making a total of 2,687 persons arrested. There were 2,422 convictions, representing 98% of convictions in cases that went to trial.

Prison sentences totalled 2,884 years and additional sentences of 2,538 years were suspended or probated. Fines in criminal cases prosecuted totalled \$23,734.02.

Cases of all types received for investigation, including counterfeiting and forgery cases, aggregated 39,884, and although 42,464 cases were completed during the year, there were 9,952 cases still awaiting investigation as of June 30. (U. E. B.)

Securities: *see* BANKING; STOCKS AND BONDS.

Securities and Exchange Commission.

A bipartisan, quasi-judicial agency of the U.S. government, the Securities and Exchange commission (SEC) administers several laws in the general field of securities and finance enacted for the protection of the investing public.

Securities Act of 1933.—This law prohibits fraud and deceit in the sale of securities generally, and requires disclosure of financial and other information concerning securities offered for public sale.

Prior to such public offering of securities, they must be registered with the commission through the filing of a statement containing prescribed data, and a prospectus summarizing the salient information must be delivered to investors. At the end of the fiscal year 1952, \$75,400,000,000 of securities had been so registered, a record of \$9,500,000,000 during that year.

Registration of securities does not guarantee against loss in their purchase. It merely seeks to provide investors with information upon which they may make an informed analysis of the securities and prudent investment decisions based thereon. Nor is registration a warranty of the accuracy of the facts disclosed, but investors who suffer losses in the purchase of registered securities have important recovery rights if material facts are misrepresented.

Securities Exchange Act of 1934.—Issuers of securities listed for public trading on national securities exchanges are required by this law to register and file annual and other periodic reports providing disclosure of data essential to investment analyses.

At the end of fiscal 1952, 3,588 security issues of 2,192 companies were so registered. The volume of trading therein during the fiscal year was \$19,500,000,000.

Holders of listed securities also must be provided with pertinent information when their proxies are solicited on corporate matters. In addition, management officials and large stockholders of listed companies must report their transactions in the equity securities of their companies and are accountable to the issuer for short-term trading profits therein—measures designed to curb misuse of "inside" information. During the fiscal year, 1,818 proxy statements and 21,026 insider trading reports were filed.

The law further provides a system for the regulation of securities markets designed to eliminate all impediments to free and open markets truly reflective of the law of supply and demand and the composite judgment of the investing public as

to the worth of securities. Exchanges as well as persons or firms engaged in an over-the-counter securities business must register and conform their business practices to standards designed for the protection of investors. Sixteen exchanges and 3,997 brokers and dealers were so registered at the end of fiscal 1952, as was one association of brokers and dealers organized for self-policing purposes in the over-the-counter markets.

Provisions of this law and the Securities act prohibiting fraud and deceit, manipulation and other abusive practices in the purchase and sale of securities are buttressed by SEC powers of investigation into securities violations and enforcement of strict sanctions which provide a means of punishing offenders and which also operate as a deterrent to defrauding of investors.

Public Utility Holding Company Act of 1935.—This law provides for the regulation of holding company systems of electric and gas utility companies in the interest of protecting investors and consumers against any recurrence of the evils which gave rise to its enactment, such as pyramiding of holding companies with complex corporate structures and multiple-security capital structures containing disproportionately large amounts of senior securities and resulting in a concentration of control in a few individuals and companies over large segments of the utility industry; issuance of securities against fictitious and unsound values; mismanagement and exploitation of operating companies by holding companies through excessive service charges, excessive common stock dividends, upstream loans and other extortionate intercompany transactions; and similar abuses. The law also calls for major overhauling of holding-company systems and their capital structures to the end that the operations of each system shall be confined to an integrated group of utility properties within a limited area and that pyramided corporate and complex capital structures shall be simplified and voting power redistributed among security holders on an equitable basis.

The readjustment process to June 30, 1952, resulted in a reduction in the number of registered utility holding company systems from 54 to 40; of holding companies from 77 to 57; of utility subsidiaries from 751 to 192; and of nonutility subsidiaries from 644 to 188. This was effected through the divestment by the various systems of companies and properties unrelated to their respective principal systems of integrated properties; by the liquidation and dissolution of useless and uneconomic companies; and by mergers, consolidations and reorganizations. The aggregate assets of the 40 remaining systems were only slightly less than the \$14,000,000,000 valuation of the original 54 systems, despite divestments aggregating \$10,500,000,000. But these figures do not present the full picture, for an additional 259 companies with assets aggregating \$6,200,000,000 had been divested by system companies but, because of their acquisition by or relationship to other holding companies, remained subject to the commission's jurisdiction under the law.

The existing size of the remaining 40 registered systems was attributable largely to the tremendous growth of the utility industry during recent years. In this connection, since 1947 the commission had passed upon the issuance and sale of \$5,500,000,000 of utility securities, the bulk of the proceeds of which were used for plant expansion. Before authorizing the sale of such securities, the commission must satisfy itself that they meet certain minimum statutory standards designed to protect the financial stability of the issuing company and to safeguard the rights and interests of investors and consumers. There was no doubt that the operation of this law was responsible in no small measure for the strong financial condition of the utility industry and its ability to carry out its vital role in the postwar industrial expansion and the defense program.

Upon completion of the integration and simplification pro-

gram, it was expected that about 20 holding company systems with assets of approximately \$7,000,000,000 would continue subject to the commission's jurisdiction under the law.

The commission also administers the Trust Indenture act of 1939, the Investment Company act of 1940 and the Investment Advisers act of 1940 and serves as adviser to federal courts in corporate reorganization proceedings under Chapter X of the Bankruptcy act. (D. C. Ck.)

Seeing Eye, Inc.: see SOCIETIES AND ASSOCIATIONS, U.S.

Seismology. Normal earthquake activity continued during 1952 with no great cataclysms and few shocks of unusual scientific interest. Popular excitement resulted, however, from the July 21 Arvin-Tehachapi shock, among the five strongest in California history. Twelve persons died, many were injured, and more than \$50,000,000 damage resulted in Kern county alone, Tehachapi sustaining almost complete destruction of its business district. In Bakersfield an oil refinery burned. State highways were blocked by landslides and several railroad tunnels were wrecked. Hundreds of aftershocks followed, mostly minor, although one on Aug. 22 near Bakersfield killed 2, injured 32, and damaged at least 100 buildings. This series of disturbances occurred over the little-known White Wolf fault system, south of Bakersfield and not related to the San Andreas fault.

The Chinese radio on Jan. 4 reported a hitherto undescribed quake of Dec. 21, 1951, as having killed 300 persons in western Yunnan, injured 1,537 and rendered 100,000 homeless. A quake struck the vicinity of Erzerum and Hasankale, Turk., on Jan. 3, collapsing 600 huts, killing 62 persons and injuring 250. Hokkaido, Japan, experienced a shock on March 4, among the strongest in Japanese history, which killed approximately 30 and made 2,800 homeless. Effects included derailed trains, inundation of 14 villages by tidal waves and the loss of 515 boats.

Quakes also occurred on March 19 near Mt. Etna, It., with 3 dead and 1,500 homeless; on June 10 at San Juan, Arg., where 2 died and 150 were injured; and on July 4 at Johannesburg, U. of S.Af., where 7 natives died in a mine rockburst. The scene of a devastating 1950 quake in the Toledo-Arboledas-Cucutilla area of Colombia was reshaken on April 19 with some damage. Numerous strong shocks spent themselves harmlessly in uninhabited areas of the world.

Under sponsorship of the United Nations Educational, Scientific and Cultural organization, two Pakistan seismograph stations were established at Quetta and Lahore, and a Jesuit station at Baguio, P.I., destroyed during World War II, was re-established.

Scientific interest was stimulated by publication of many technical papers. These dealt with such problems as earth-wave mechanics, the release and dissipation of earthquake energy, regional earthquake-wave travel speeds and the use of micro-seisms in hurricane detection. Engineering seismology held major interest. In this field of study, two symposium meetings were addressed by eminent seismologists and structural engineers. The larger of these, held at Los Angeles, Calif., was attended for three days by 350 engineers from all over the United States. Theoretical and practical papers indicated that solutions of some aspects of the complex problems of earthquake-resistant design were in sight.

The coast and geodetic survey, besides observing and analyzing strong earthquake motions for engineering purposes, continued to plot and report the locations and nature of observed quakes everywhere, and to map the seismicity of world areas for use by insurance companies in setting rates, for construction engineers in evaluating earthquake hazards and for scientists in

MAIN STREET of Tehachapi, Calif., on July 22, 1952, the morning after an earthquake, which centred on the town, destroyed about 150 houses and killed 12 persons. The tremor was felt over a 100,000 sq.mi area

attacking geophysical problems. (See also COAST AND GEODETIC SURVEY, U.S.; DISASTERS.) (E. B. R.)

Selective Service, U.S. The armed forces called on Selective Service for approximately 415,000 men during the calendar year of 1952, bringing the total of those called since passage of the draft legislation in June 1948 to approximately 1,150,000. Actual inductions were about 1,200,000.

Eighty thousand of the inductees were assigned by the department of defense to the marines, the others to the army, none to the navy or air force.

Calls are issued by the department of defense monthly in accordance with requirements of the armed forces. When the director of Selective Service receives a call, he apportions it among the states on the basis of the number of men available for service—that is, those in classification I-A, examined and found acceptable by the armed forces, with credit for those already in the armed forces. The states apportion their calls among their local boards on the same basis.

The end of the year 1952 saw a manpower pool which was draining rapidly; it became apparent that if the monthly calls continued at the rate to be reasonably expected—that is, somewhere in the neighbourhood of 50,000—it would be necessary to do one or both of two things: (1) tighten the deferments provided for in the basic law, which would require congressional action; (2) tighten the deferments provided for by regulation under authority of the law, which would require an executive order of the president.

In the autumn of 1952, Selective Service reports showed the classifications listed in the table on page 630.

Scrutinized especially were student and dependency deferments provided for by regulation. There were almost 200,000 of the former, not including about 320,000 R.O.T.C. deferments and about 1,000,000 dependency deferments. Congressional ac-

tion would be necessary to lower the number of R.O.T.C. deferments. Dependency and student deferments could be lowered by amending regulations through executive order of the president.

The first of the third nation-wide series of Selective Service college qualification tests was held Dec. 4, 1952, at 1,000 testing centres. The second was scheduled for April 23, 1953, and it was estimated that the total number of students taking the test would reach 500,000 on that date. Local boards use the test scores, or class standing of students, to determine eligibility for consideration for deferment.

To be eligible to apply for the college deferment test a student must (1) intend to request deferment as a student; (2) be satisfactorily pursuing a full-time course of instruction; and (3) must not previously have taken the test.

At the beginning of 1953, criteria for deferment as an undergraduate student were either a satisfactory score (70) on the Selective Service college qualification test or specified rank in class (upper half of the male freshman class, upper two-thirds of the male sophomore class or upper three-fourths of the male junior class).

Students accepted for admission or attending a graduate school prior to July 1, 1951, satisfied the criteria if their work was satisfactory. Graduate students admitted or attending after July 1, 1951, must have been in the upper half of their classes during their senior year or have a score of 75 or better on the test. It was not mandatory for local boards to follow the criteria in classifying students, but all registrants had the right to appeal their classifications under established procedure.

There were indications near the end of the year that the criteria would be made more strict. In the first series of tests 63% of the students achieved a score of 70 or better. In the second series 58% of the students made 70 or better. The tests in all three series were equivalent in difficulty.

At the end of the year Selective Service had been called on for a total of approximately 2,500 physicians and 1,200 dentists by the department of defense under provisions of the Doctors' and Dentists' Draft law.

This law provides for division of physicians, dentists, veterinarians and allied specialists into four priorities and was passed by congress because of urgent need of physicians and dentists by the armed forces and because of a widespread feeling that young men who had been deferred during World War II to continue their professional education, or were professionally educated after entering the armed forces at government expense, had an unfilled obligation.

In priorities I and II were those physicians, dentists and veterinarians under 51 years old who were deferred to continue their professional training or were trained professionally at government expense after entering the armed forces and who subsequently served less than 90 days (priority I) or 21 months (priority II). In priority III were physicians, dentists and veterinarians under 51 who saw no active service after Sept. 16, 1940, and in priority IV were those who had been in service since Sept. 16, 1940.

The law contained ample provisions to protect communities against being stripped of essential medical and dental services, and its purpose was to encourage acceptance of reserve commissions by men qualified, without resorting to induction by Selective Service.

How well the law was fulfilling that purpose is attested by the fact that near the end of the year only 6 physicians and 14 dentists had actually been inducted; whereas approximately 5,000 physicians and 2,500 dentists had voluntarily accepted reserve commissions and then been called to active duty as reservists.

One inducement for volunteering for a commission was a flat \$100 additional monthly pay; those who waited for induction did not receive this additional amount.

Inauguration of a project under which apprentices in approved training programs could be deferred was one of the high lights of the year. Another was the launching of a program to meet requirements of the law for placing registrants classified as conscientious objectors opposed to any kind of military service in jobs considered essential to the national health, safety or interest. Both were put into effect by executive order of the president on recommendation of the director of Selective Service. (See also LAW.) (I. W. H.)

Senanayake, Dudley Shelton (1911-), Ceylonese statesman, was born at Colombo June 19 and was educated at St. Thomas's college, Colombo, and at Corpus Christi college, Cambridge. When only 24 years old he was elected to the Ceylonese state council, becoming its youngest member. When his father became prime minister of Ceylon in Sept. 1947, Dudley succeeded him as minister of agriculture and lands. On March 22, 1952, his father died from a riding accident, and four days later Lord Soulbury, the governor general, called on him to succeed his father as prime minister, minister of defense and minister of external affairs. He announced his government on the same day. On March 31 he went to Kandy, where he knelt before the Sacred Tooth relic, dedicating himself to the cause of Ceylon. He was unanimously elected president of the United National party, and immediately asked the governor general for a dissolution of the house of representatives. He conducted a strenuous election campaign in which he made at least six speeches daily, and was re-elected in his own constituency of Dedigama. The elections (May 24-30) resulted in a majority for the United National party, and Senanayake reformed his cabinet on June 2. He attended the commonwealth prime ministers' conference in London Nov. 27-Dec. 11.

Seventh-day Adventists. The two most prominent events in the life of this church in 1952 were: (1) The centenary of the Sabbath school department. In 1852 in Rochester, N.Y., James White, one of

the founders of the church, prepared the first Sabbath school lessons for less than 1,000 members. The world Sabbath school membership at the end of 1951 was 1,034,060. (2) The Bible conference held in September at the international headquarters, Washington, D.C., to which delegates came from all over the world. This conference, first of its kind since 1919, restudied and reaffirmed the doctrines of the church. The world membership of the church—baptized members only—at the close of 1951 was 803,720. The membership in the United States and Canada on June 30, 1952, was 264,969. For the year 1951 this North American segment of the membership contributed \$41,000,000 to the church. The autumn council, the major annual assembly of the church leadership, voted a budget of \$18,562,822 for the year 1953, most of which was to go for the maintenance and expansion of overseas missions and none of which was to be used to meet the operating expenses of churches in North America. This budget was the largest in the history of the denomination, being \$1,500,000 higher than that for 1952. Important measures voted by the autumn council included the following: to create a Legion of Honor to rally the youth of the church against degrading literature, movies, sports, etc.; to endeavour, through education and legal action, to repeal city ordinances that prevent the free circulation of literature from home to home; to intensify the program, initiated a year earlier, to conduct an evangelistic mass meeting in every major city in North America; to place a certain piece of evangelistic literature in at least one-fourth of the homes in North America in 1953; to expand greatly the campaign against liquor; to hold a Pan-American youth congress in the summer of 1953 for the youth of North and South and Inter-America; to publish a weekly journal for Adventist juniors. (See also CHURCH MEMBERSHIP.) (F. D. N.)

Seychelles. British colony and dependencies, 92 islands (Mahé being the largest) in the Indian ocean. Area: 156 sq.mi. Pop.: (1947 census) 35,232, mainly Negro; (1951 est.) 37,000. Language: English, French creole patois. Religion: Christian (c. 66% Roman Catholic). Capital, Victoria (pop. 1947: 9,478). Governor in 1952: Frederick Crawford.

History.—In 1952 a fall in the price of copra from £95 to £48 a ton caused a setback to development and a revision of government expenditure, and gave added importance to the current policy of diversifying the colony's agricultural production. The Colonial Development corporation's fishing experiment had to be abandoned because there were not enough fish. A small outbreak of poliomyelitis occurred in April. (K. G. B.)

Education.—Schools (1951): 23 primary (3,965 pupils); 2 modern (129 pupils); 2 secondary (188 pupils); 1 technical training centre.

Finance and Trade.—Monetary unit: Seychelles rupee, valued in 1952 at 21 cents U.S. Budget (1952 est.): revenue Rs. 4,802,154; expenditure Rs. 4,997,241. Foreign trade (1951): imports £407,000; exports £838,000. Production (1951): copra 6,571 tons, cinnamon oil 99,332 kg.; cinnamon bark 207 tons; vanilla 484 kg. Livestock (1950 census): 2,112 cattle; 2,328 pigs; 1,200 goats; 40,000 chickens.

See F. D. Ommanney, *The Shoals of Capricorn* (London, 1952).

Shamun (Chamoun), Camille (1899–), Lebanese statesman, was born at Deir el-Kamar, Lebanon. He was a member of an ancient family of Christian (Maronite) Arabs, was sent to a French Roman Catholic secondary school at Beirut, and later obtained a law degree at the French university there. After World War I he joined the Beirut bar and took an active part in political life. He was elected deputy in 1934, was constantly re-elected and from 1938 served as minister of finance of the regional Lebanese government under the French mandate. In 1943 he sided with those who supported Lebanese independence and was appointed minister of the interior in the first Riad Solh cabinet (1943–45). From 1945–47 he served as minister to

Great Britain. Returning to his country he became minister of finance in the third Solh cabinet. He resigned in 1948, opposing the re-election of Sheikh Bishari al-Khuri as president of the republic for a second six-year term. He was instrumental in forcing al-Khuri's resignation three years before his term of office was to expire. His election as president of the republic on Sept. 23, by 74 votes to 2, in a chamber in which al-Khuri's supporters were in great majority was a personal triumph for Shamun, who was universally respected for his character and integrity.

Sheep: see LIVESTOCK.

Shipbuilding. The world tonnage of merchant vessels (each of 1,000 gross tons or more) registered as of June 30, 1952, was distributed as follows among the principal maritime nations:

Country	Number of vessels	Gross tonnage (in thousands)	Country	Number of vessels	Gross tonnage (in thousands)
United States*	3,441	25,627	Greece	211	1,176
British Commonwealth	3,006	18,795	Finland	193	526
Norway	961	5,532	Brazil	182	684
Sweden	594	2,157	China	143	414
France	559	3,276	Argentina	141	902
Panamá	550	3,730	Turkey	109	387
Netherlands	496	2,866	Portugal	93	419
U.S.S.R.	477	1,456	Belgium	75	428
Italy	517	3,048	Honduras	79	425
Japan	497	2,378	Liberia	99	942
Denmark	312	1,259	Yugoslavia	53	225
Spain	268	982	Other Countries	413	1,581
Germany	319	1,001			
Total				13,788	80,216

*Excludes vessels operating on the Great Lakes.

The total of 80,216,000 gross tons of vessels in the world fleet represented an increase of 2,792,000 gross tons since June 30, 1951. However, the United States fleet during the same period decreased by 36 vessels, aggregating 142,000 gross tons. The remainder of the world gained approximately 2,934,000 gross tons of shipping.

The Shipbuilders Council of America reported as of July 1952 that 1,829 vessels (each of 1,000 gross tons or more), aggregating 15,858,472 gross tons, were under construction in the various maritime countries of the world, excluding the U.S.S.R.

The gross tonnage total of 15,858,472 was an increase of 4,119,209 since July 1951. With the exception of Trieste, which showed a slight reduction in gross tonnage from that of July 1951, all countries showed an increase shared in fairly equal proportion.

United States.—On Jan. 1, 1952, 80 seagoing commercial vessels (each of 1,000 gross tons or more), aggregating 1,074,320 gross tons, were under construction or under contract for construction in the private seaboard shipyards of the United States. These consisted of 1 passenger vessel, 35 cargo vessels, 3 navy transports, 37 tankers, 3 lake ore carriers and 1 river ore carrier.

At the same time there were contracted for or under construction in the Great Lakes shipyards 16 vessels (each 1,000 gross

Merchant Ships under Construction in the World, July 1952

Country of Building	Number of vessels	Gross tonnage (1,000 gross tons or more)
Great Britain	721	6,372,144
Sweden	193	1,778,265
Germany	245	1,722,726
United States	102	1,364,370
Netherlands	135	1,106,600
Japan	64	700,750
Norway	83	578,259
France	92	859,688
Denmark	63	408,434
Italy	33	294,620
Belgium	23	233,671
Canada	14	125,000

Trieste	7	59,700
Australia	17	77,508
Ireland	2	2,300
Total		15,858,472

tons or over) aggregating 176,870 gross tons. These consisted of 2 large passenger railway ferries, 1 large passenger auto ferry and 13 bulk ore carriers (including 2 self-unloaders).

There were 21 new vessels delivered in the United States in 1952 up to Oct. 1 as follows: 1 passenger vessel, 6 tankers, 9 lake ore carriers, 1 river ore carrier, 2 navy transports, 1 passenger auto ferry and 1 passenger railway ferry.

Of special interest was the delivery of the passenger ship the S.S. "United States," the largest and fastest commercial vessel ever built in the United States, which was put in service by the United States lines in July 1952.

The first nine months of 1952 witnessed the launching of 11 cargo vessels of the Maritime administration's program of 35 "Mariner" class ships. These were the largest and fastest cargo ships afloat, each having a capacity of 12,900 dead-weight tons. Construction of these vessels, which were 560 ft. 10 in. long over-all and had a speed of 20 knots, was divided among seven of the United States shipyards.

During the year 1952 up to Oct. 1, contracts for 21 vessels were awarded, all tankers, with the exception of 1 lake ore carrier.

As of Oct. 1, 1952, there were 96 merchant vessels (of 1,000 gross tons or over), aggregating 1,314,780 gross tons, under contract for construction in the United States of which 9, aggregating 102,300 gross tons, were for construction in the shipyards on the Great Lakes, and the remainder in seaboard shipyards. In addition to the somewhat inadequate allocation of steel in the early part of the year, the steel strike further retarded construction, which in general was from four months to one year behind original schedules.

During the year 1952 the U.S. navy continued its program inaugurated in 1951 of reactivation, modernization and new construction, resulting in the award to private shipyards of contracts for a second nuclear-powered submarine and for mine sweepers, fleet oilers, tank landing ships and an icebreaker, as well as patrol and other service boats. This work, in addition to a number of contracts for small vessels including landing craft, harbour tugs and floating cranes awarded by the navy for the army, was widely distributed to shipyards throughout the United States.

The volume of repair work in the United States yards remained fairly steady throughout the year, with no appreciable change in employment. There was, however, a heavy return to preservation status of commercial vessels which had been pulled out of reserve for operation under the jurisdiction of the National Shipping authority. This reduced the possible number of maintenance and voyage repairs, but the situation was balanced by navy conversions and other work for which the navy awarded contracts, as well as by the continuation of the T2 (tanker) strengthening program. (H. G. S.)

Great Britain.—Outstanding features of shipbuilding in Great Britain during 1952 were the high proportion of the total volume of work represented by oil tankers and the insufficiency of steel. Besides not securing all the steel they needed, builders were troubled by the irregularities of supplies.

The ability of the shipyards to absorb larger quantities of raw materials was emphasized by the considerable volume of work proceeding and by the number of orders, which was the heaviest ever recorded. The volume of shipping under construction in the yards of the United Kingdom throughout the year according to returns of *Lloyd's Register*, ranged between 2,000,000 tons and 2,270,000 tons gross. At 2,062,482 tons gross the amount under construction on Sept. 30 represented a decline as compared with 12 months previously of more than 200,000 tons gross. This was a reflection of the insufficiency of steel.

In reply to urgent representations the allocation for the last quarter of the year was 8% more than for the third quarter, and on Oct. 22 the civil lord of the admiralty announced that the allocation for the first quarter of 1953 would be higher by 9% than that for the last quarter of 1952.

During the first nine months of 1952 orders were received by British builders for a little more than 1,000,000 tons gross of new British shipping. There were on Sept. 30 nearly 7,000,000 tons gross in the order books of the builders, which represented a current value of about £670,000,000. Work for owners abroad represented 34% of the total. Oil tankers constituted more than 56% of all orders on the books, cargo liners 22% and cargo tramps 12%. There were comparatively few passenger liners under construction. (Ct. M.)

Shipping, Merchant Marine. The U.S. merchant marine consisted of 3,347 ocean-going vessels of 1,000 gross tons and more on Sept. 30, 1952. A total of 45% of this fleet was in active service. The active vessels numbered 1,495, divided between 978 dry-cargo ships, 71 combination passenger and cargo vessels and 446 tankers; 85% of the active fleet was privately owned; the rest were government-owned vessels.

This was in sharp contrast with the situation existing on Jan. 1, 1952, when the active fleet numbered 2,009, of which 36% were government-owned ships. The drop in active government-owned ships was caused by a partial reversal of the conditions which had brought about the withdrawal of large numbers of government ships from the reserve fleets shortly after the outbreak of war in Korea.

At that time there were not enough privately owned vessels available to carry the troops and military supplies needed to support the United Nations in Korea, and the best and fastest ships, mostly of the Victory type, were withdrawn by the Maritime administration from its reserve fleets for use by the military sea transportation service. In addition, severe shortages of coal and grain in Europe and Asia made it necessary to obtain emergency supplies from the United States. The Maritime administration therefore withdrew many of the slow but capacious Liberty ships from reserve to supplement the privately owned vessels carrying these supplies abroad.

The National Shipping authority had been set up within the Maritime administration of the U.S. department of commerce in March 1951 as part of the mobilization effort to direct government-controlled shipping in programs of national interest. Government ships were operated under the direction of this agency by private companies serving as its general agents. In the year following its establishment, the NSA appointed 48 companies as general agents, withdrew about 460 vessels from reserve and directed the shipment of 13,500,000 tons of non-military cargo overseas, in addition to making tonnage available to transport military supplies.

By the early part of 1952, however, there was a falling off in demand for foreign-aid cargoes. A mild winter in Europe and increased production capacity abroad lowered the requirements for imports of coal and grain from the United States, and a rapid addition of new vessels to foreign fleets increased the number of ships available to carry the cargoes. Consequently, on the first anniversary of its establishment, the NSA announced that 120 ships were being withdrawn from service to avoid competition of government-owned with privately owned ships. By Oct. 1, 1952, 543 government ships had been returned to reserve by general agents, and only 93 were still in operation, all engaged in carrying military supplies.

In addition to the vessels under general agency, there were a few government-owned vessels under charter to private com-

panies to help provide service in trades considered important to the national interest, for which privately owned vessels were not available or were not available at reasonable rates and conditions. These charters had also been steadily declining, however, from 217 on Jan. 1 to 65 on Oct. 1, 1952. The need for these few was being challenged by tramp ship owners, who were finding it difficult to keep their own ships in operation in a steadily falling freight market. At the end of September the Federal Maritime board was reviewing the necessity for these charters.

There were about 100 large vessels under construction or on order in United States shipyards throughout the first nine months of 1952. Thirty-five of these vessels were of the "Mariner" type, ordered by the Maritime administration in 1951 to provide a group of 20-knot cargo vessels of 12,900 tons cargo capacity, especially designed to meet the competition of improved foreign vessels built since the end of World War II and to provide the armed services with auxiliaries suited to modern high-speed warfare. By Oct. 1, 1952, 11 of these vessels had been launched. The first two were delivered early in October, and were assigned under general agents to carry military supplies.

A total of 85% of the other large vessels under construction in United States yards on Oct. 1, 1952, were tankers ordered by private operators. In June 1952 the largest and fastest passenger liner ever built in a United States shipyard, the S.S. "United States," was delivered into service. On her maiden voyage across the North Atlantic, this 53,000-gross ton vessel broke all speed records for merchant ships, at times exceeding 34 knots. (A. W. Gv.)

Great Britain.—Conditions affecting the employment of both ordinary cargo ships or tramps and passenger and cargo liners underwent great changes in Great Britain in 1952. An early intimation that the British government did not propose to import further large quantities of coal from the United States was a considerable influence in the freight markets, for the purchases of more than 1,000,000 tons of coal during 1951 had been an important factor in the rise in freight rates generally. There was also not the same urgency about the arranging for the importation of timber and grain as had stimulated the freight markets in 1951.

Freight rates began to decline early in 1952 and, with the exception of one small upward movement during May, they continued to fall till autumn was well advanced.

In March the Australian government announced a drastic cutting down of imports. Australia had been importing throughout 1951 on an unprecedented scale, and the liner companies had been unable to carry the immense volume of merchandise which Australian importers wanted. The lines had therefore been chartering tonnage freely, and the declaration of the Australian government that imports were excessive and must be curtailed found the regular lines with more tramp tonnage chartered than they could employ.

Imports of all kinds of manufactures to New Zealand had also been rising and the regular lines had found it necessary to charter additional ships to supplement their own sailings. Imports were restricted in the spring of 1952 by limitation of credit and other means and the chartering of additional ships was no longer required. This cessation of chartering for the Australian and New Zealand trades withdrew one of the main supports of tramp shipping.

The marked changes in the freight situation which began with the outbreak of war in Korea were indicated in the freight index numbers of the Chamber of Shipping of the United Kingdom. These figures were based on 100 as the average of the monthly numbers for 1948. In May 1950 the figure was 71.4. This rose sharply with only one check until 203.8 was reached in May

1951. Then with certain interruptions a downward movement began and in Jan. 1952 the figure was 163.9. Following a slight recovery during May 1952, the number declined until in August 79.2 was reached, which was below the figure for Aug. 1950 of 86.6. Meanwhile expenses had risen sharply, particularly of oil fuel. The wages of British seafarers had been increased, and freight rates which would have left a profit before the Korean war began became unremunerative. Some owners, both in Great Britain and in other European countries, decided to lay up their ships and many others kept ships in port, with skeleton crews on board, in the hope that freight rates would before long take a turn for the better.

Those owners were fortunate who had modern oil-burning steamers or motor ships in their service, for it was found that only efficient, economical ships could cover their expenses or earn small margins of profit at the ruling rates. The newest ships, however, were at a disadvantage because although economical to operate they had cost so much to build that allowance for depreciation at the traditional rate of 5% and interest on the large capital invested imposed a heavy charge on earnings.

The decline in tramp rates emphasized the claim of British owners that high taxation absorbed too much of their earnings and, one after another, spokesmen for shipping companies urged the need for some provision that earnings set aside for replacement should not be taxed. Failing such treatment, owners foretold the gradual diminution of fleets of dry-cargo ships. Although in total volume the tonnage of the British mercantile marine before World War II had been regained, this recovery was partly the result of a great increase in oil-tanker tonnage. Some of the best-known British cargo fleets were only a fraction of their prewar size.

In the autumn there was some expansion of the demand for cargo shipping. Among the influences was a strong demand for ships to carry grain from North America to India and Pakistan. Generally the demand for shipping became widespread, and there was some competition between different markets for tonnage, a state of affairs which is always favourable to owners.

Subject to the falling off of shipments in the Australian route, cargo liners continued to be well employed. Demands on the passenger accommodation continued heavy. The passenger season in the North Atlantic opened unusually early in the spring and closed exceptionally late in the autumn. (Cr. M.)

THE "FLYING ENTERPRISE," storm-damaged merchant ship, being towed (from off left) toward a British port in Jan. 1952. Capt. Henrik Kurt Carlsen, who remained with the U.S. freighter until the tow line snapped and it sank, was knighted for his courage by King Frederick IX of Denmark

Shoe Industry.

During 1952, shoe manufacturers in the United States maintained steady production from 60% to 100% of plant capacity, and it was estimated that year-end totals would show about 500,000,000 pairs of shoes manufactured, as compared with 469,599,000 pairs in 1951. Military shoes accounted for 20,000,000 pairs in 1951 and approximately 5,000,000 or 6,000,000 pairs in 1952.

There were several factors that contributed to this position. Leather was in good supply. Prices had been readjusted downward and reflected the sharp declines that had taken place in the hide and skin market. Inventories were kept in line and manufacturers concentrated their efforts on quality, construction, materials and attractive new features.

Some of the highlights that were given prominence were: soft construction and more femininity in women's shoes; the bare minimum shoe, achieved with very narrow strippings; the Spanish and Italian influence in the banded shoe with one or two wide or narrow bands placed strategically to hold the shoe firm on the foot. Foam cushioning in the sole or throughout the entire bottom of the shoe was a new feature to give added comfort. Colourful casuals, with flat or wedge heels, accounted for a good proportion of shoe production. In children's shoes, colour was a dominant factor, and navy and red took precedence over the generally accepted black and brown. Children showed a preference for styling that approximated adult shoes. Nylon mesh and the casual slip-on types of men's shoes gained in favour and acceptance during 1952.

On Sept. 23 the Office of Price Stabilization suspended price controls on shoes at the manufacturing, wholesale and retail levels. All types of shoes and slippers were included, with the exception of all-rubber shoes (overshoes, galoshes and tennis footwear). In the all-rubber category, the manufacturers' ceiling was retained.

Shoe Production in the United States

	1951*	1952†
Men's shoes	105,949,000	67,659,000
Boys' shoes	14,497,000	12,040,000
Women's shoes	206,302,000	160,979,000
Misses' and children's shoes	54,817,000	42,126,000
Infants' and babies' shoes	33,911,000	24,272,000
All others	54,123,000	33,700,000
Total	469,599,000	340,776,000

*Includes 20,000,000 pair military shoes.

†Production for first eight months; includes 5,000,000 pair military shoes.

In retailing, clearance sales in January and early February weeded out odds and ends and brought inventories into a more reasonable ratio to consumer demand. Unit-wise, more shoes were sold during the first six months than in the same period of the previous year. Dollar-wise the return was less. This decrease was accounted for by a drop in shoe prices estimated at 15% at the retail level.

A drastic decline in hide and skin prices early in the year was attributed, to some extent, to unloading of heavy inventories by some packers. Recovery in the raw materials market began to be felt early in May and fluctuations up or down were in ratio to demand.

Leather was in a more competitive price bracket with substitute materials, and a broad educational program was launched by the Leather Industries of America, sponsored by the tanners and leather manufacturers of the United States, to inform the consuming public of the quality ingredient of leather. (E. G. AN.)

Shooting.

The 53rd Grand American tournament, major event of trapshooting, attracted a field of more than 1,800 crack marksmen to Vandalia, O., in Aug. 1952, and when the long competition had ended, the Grand American handicap prize for men was in possession of Orval E. Voorhees

of Grand Island, Neb., who broke 98 of 100 targets from 18 yd. to defeat Ned Lilly, Stanton, Mich., who scored 97 X 100 from 25 yd. Marjorie Miller, Newton, Ia., took home the Grand American handicap trophy for women with a tally of 91 X 100 from 18 yd. Myrtle Wiese, Seattle, Wash., with 90 X 100 from the same distance, was the runner-up.

Rudy Etchen, Sun Valley, Ida., won the North American clay target crown with 200 X 200 after a shoot-off with F. D. Daily and Kenneth S. Houck. Etchen also took the high-over-all laurels with 961 X 1,000 and was the all-around champion with 381 X 400. Mrs. Frances King, Atlanta, Ga., annexed three of the top prizes for women, winning the clay target event with 197 X 200, the all-around laurels with 361 X 400 and the high-over-all with 919 X 1,000.

A. M. Perkins, Shreveport, La., took the North American clay target money for professionals, scoring 200 X 200, the pro Grand American handicap being captured by Don Flewelling of Harvey, Ill., who had 90 X 100 from 25 yd. Vic Reinders, veteran from Waukesha, Wis., was crowned champion of champions, but only after a three-way shoot-off with Arnold Riegger, Seattle, and M. D. Clark, Woodbury, Conn. Mrs. Julius Petty, Stuttgart, Ark., won similar honours for women after an extra shoot with Mrs. Frances King and Iva Pembridge, Phillipsburg, Kan. Cliff Doughman, Morrow, O., was the professional all-around victor with 370 X 400. David Brooks, Kewanee, Ill., triumphed in the junior Grand American handicap although Bob Autry, Atlanta, was the North American clay target, national doubles, high-over-all and all-around champion in the junior division. Mercer Tennille, Shreveport, won the national doubles; Iva Pembridge annexed the women's and Doughman the pro doubles.

The invitation amateur championships of America were held at Pelham Manor, N.Y., in May and Walter Ostrom, Orangeburg, N.Y., with 199 in the 200-target test, was among the victors. Other major winners were Mrs. W. L. Battersby, Philadelphia, Pa., 100-target women; E. E. Gardner, Bernardsville, N.J., 100-target seniors; Dick Baldwin, Danbury, Conn., 200-target junior and invitation, and H. L. McKinley, Harrisburg, O., 100-target preliminary and doubles.

Lewis Gordon, Texarkana, Ark., scoring 540 X 550, took the high-over-all title in the championships of the National Skeet Shooting association at Dallas, Tex. Major Harry B. Trimble of Hickam air force base, Honolulu, T.H., annexed all-gauge honours with 250 X 250 and the service individual laurels. Grant Ilseng, Houston, Tex., was the champion of champions and D. W. Conway, Clint, Tex., triumphed in the 20-gauge group. Jimmy Clark, Bartlesville, Okla., made a near sweep of the junior prizes, being high-over-all, all-gauge, 20-gauge and sub-small-gauge victor. He also teamed with David White, Tulsa, Okla., for the open small-gauge two-man award. Joseph M. George, Sudlersville, Md., captured the high-over-all and J. H. Frost, Sr., San Antonio, Tex., the all-gauge titles for seniors. Nancy Burrus, Dallas, won two major prizes for women, the high-over-all and the all-gauge and Mrs. Alphonso Ragland, Jr., Dallas, was the 20-gauge victor.

A new world record long run of 614 straight targets with a 20-gauge gun was set by Tom Sanfilipo of San Francisco, Calif., in the San Joaquin, Calif., open skeet shoot, May 3-4. The mark bettered by 168 targets the former standard set by Dick Shaughnessy of Dedham, Mass.

National rifle champions for the year included Robert Perkins, Fresno, Calif., small bore; Major Robert A. Dawson, Barstow, Calif., high-power service rifle, and Lieut. Col. Walter Walsh, Arlington, Va., high-power match rifle. Betty Ingleright, Buchanan, Mich., won with the small-bore gun among the women and Alice Bull, Seattle, triumphed with the high-power match

weapon. William T. Toney, Jr., El Paso, Tex., captured national pistol laurels for men and Maria Hulseman, Towson, Md., was queen of the women. (See also OLYMPIC GAMES.) (T. V. H.)

Shows. This article covers horse and dog shows, livestock exhibitions and such travelling shows as circuses, carnivals, ice skating shows and rodeos. For musical and dramatic events of 1952, see the articles MOTION PICTURES, MUSIC, THEATRE and DANCE.

Horse Shows.—The two largest and most representative horse shows in the United States in 1952 were those of the International Live Stock exposition in Chicago, Ill., Nov. 29 through Dec. 6, and the American Royal Horse show in Kansas City, Mo., Oct. 18 to 25. Both were among the oldest established horse shows in the country and were outstanding in the quality, number and variety of pleasure horses that they featured. They included exhibitions of three- and five-gaited saddle horses, harness horses and ponies, roadsters and hunters and jumpers. The International also featured creditable competitive exhibitions of three draft horse breeds, which were fast disappearing from the show scene. The 1952 International included for the first time a national cutting horse contest in which 16 top western riders and their mounts, for the most part quarter horses, competed for substantial purses and the honour of taking part in the year's final contest, held annually at the Grand National show in November at San Francisco, Calif.

Two of the year's largest competitive showings of quarter horses, a breed increasingly popular in ranch and farm work, so named for its reputation as the fastest horse over a distance of a quarter of a mile, were seen at the National Western Stock show in Denver, Colo., Jan. 11 to 19, 1952, and at the Southwestern Exposition and Fat Stock show in Fort Worth, Tex., Jan. 28 to Feb. 3.

The Kentucky state fair, Sept. 5 to 13, at Louisville, was one of the year's leading competitive saddle horse shows; and the year's top exhibition of hunters was at the National Horse show, Nov. 4 to 11, in Madison Square Garden in New York city.

Other prominent horse shows of 1952 were the Harrisburg, Pa., show; the Devon Horse show, Devon, Pa.; and those held in conjunction with the Indiana, Kentucky, Illinois, Minnesota, Missouri, Ohio and Wisconsin state fairs.

Livestock Shows.—Denver, Colo., with its January National Western Stock show, opens the livestock show year in the United States. Chicago, in its December fixture, the International Live Stock exposition, is annually the final event. The Denver show is traditionally the country's largest exhibition of purebred Hereford cattle, the dominant breed of the range country.

Another important January event is the Southwestern Exposition and Fat Stock show in the Will Rogers Memorial auditorium in Fort Worth, Tex. This is the oldest livestock exhibition in the United States. It is one of the country's largest competitive exhibitions of purebred Brahman cattle, and is also noted for its exhibits of purebred Hereford cattle and, to a lesser extent, of Aberdeen-Angus and Shorthorns. Immediately following the Fort Worth event is the Houston, Tex., Fat Stock show in early February, a growing exhibition of the major beef breeds as well as of Brahmans. Both shows include rodeos as entertainment features.

After a lapse of several months during the spring and early summer, important showings of all breeds of farm animals resume again at the late summer state fairs. In most states, they are preceded by county fairs, which are held through July and August. State fairs continue in consecutive weeks in circuits through the eastern, midwestern and western states. Some of the largest livestock exhibitions of the 1952 show season were

seen at the Illinois, Indiana, Ohio, Iowa, Minnesota and Wisconsin state fairs. The largest in point of attendance was the state fair of Texas at Dallas, Oct. 4 to 11, which also included the national show of purebred Holstein cattle for 1952. The largest exhibition of this breed during the year was at the Wisconsin state fair, Milwaukee, Aug. 16 to 24. The National Dairy Cattle congress was held at Waterloo, Ia., Sept. 27 through Oct. 4, 1952.

The earliest of a series of sectional exhibitions, which follow after the state fairs, was the Eastern States exposition, held in Springfield, Mass., Sept. 14 to 20. There emphasis was on the exhibition of top dairy show herds from the eastern states. Another large show of this class, but with the beef breeds dominant, was the Ak-Sar-Ben Livestock and Horse show, which was held in Omaha, Neb., Oct. 3 to 12. The leading show of the northwest was the Pacific International Live Stock exposition in Portland, Ore., Oct. 4 to 11, followed later the same month by the Grand National Live Stock exposition in the San Francisco, Calif., Cow Palace Oct. 31 to Nov. 9. Among the relative newcomers in the sectional show field, but of growing national stature, was the Eastern National Live Stock show at Timonium, Md. It was held Nov. 15 to 20, and was distinguished by strong showings of purebred Aberdeen-Angus and Hereford cattle from prominent eastern herds.

One of the country's longest established major livestock shows was the American Royal Livestock show, which took place Nov. 14 to 22 at Kansas City, Mo., and which was marked by an outstanding exhibition of purebred Hereford cattle and one of the nation's top horse shows.

Chicago brought the 1952 show year to a close with the 53rd annual International Live Stock Exposition and Horse show, topping all shows of the year in number of livestock entries with 11,011 head of beef cattle, horses, sheep and swine from the leading stock farms of 37 states. It was held in the International amphitheatre and a large area of the adjacent stockyards, Nov. 29 through Dec. 6. Its sale of meat animals totalled \$1,419,176.34.

Canadian stockmen usually make important contributions to the cattle and sheep competitions at Chicago, but in 1952 there were no Canadian exhibits because of an embargo against Canadian livestock resulting from an outbreak of foot-and-mouth disease in northwestern Canada in the spring of 1952.

Chicago was also the setting of the country's largest exhibition and sale of feeder cattle in 1952, when 446 carloads were exhibited by producers in nine western states and sold at auction to corn belt and eastern cattle feeders for the record-breaking total of \$1,339,260.31. This event was the eighth Chicago Feeder Cattle show and sale and was held at the Chicago Union Stock Yards, Oct. 30 and 31.

The two principal livestock exhibitions of Canada were the Canadian National exhibition, Aug. 22 to Sept. 6, and the Royal Agricultural Winter fair; Nov. 14 to 22. Both were held in Toronto.

The world's largest showing of purebred shorthorn cattle in 1952 was brought out at the Palermo in Buenos Aires, Arg., in August. The oldest established stock show in the world, the Highland of Scotland, celebrated its 113th anniversary in June, followed by the British Royal show in early July, marking its 104th renewal under the sponsorship of the English Royal Agricultural society. (W. E. O.)

Dog Shows.—During 1952 an estimated total of \$320,000,000 was spent in the United States by dog owners and dog breeders for the ownership, breeding and showing of dogs, etc. Of this the food bill, principally for canned dog food or dry biscuit food, amounted to an estimated \$236,000,000.

The dog population of the country remained at about 15,000,-

ooo, of which approximately 3,500,000 were purebred.

Registrations for the year ending Oct. 31, 1952, in the leading stud book, that of the American Kennel club, totalled 249,896. Adding the numbers of several other minor stud books, approximately 280,000 dogs were registered. The first ten dog breeds in order of popularity, based on these registrations, were in order: (1) cocker spaniel; (2) beagle; (3) boxer; (4) collie; (5) dachshund; (6) Chihuahua; (7) Boston terrier; (8) German shepherd dog; (9) Pekingese; (10) Pomeranian.

The largest dog show of the year was that of the Morris and Essex Kennel club at Madison, N.J., a one-day outdoor show on May 24, with 2,519 dogs present and competing. The best-in-show winner was the wire fox terrier Champion Wyretex Wyn's Traveller of Trucote, imported from England.

In obedience trials, in which dogs are judged on performance entirely, there were 292 official point trials and 162 sanction trials, for a total of 454.

Dog shows continued to be popular. There were 637 championship point shows, of which 370 were for all breeds and 267 for one breed. Added to this were 652 informal or sanction shows, for a grand total of 1,289 conformation shows (based on type and physical perfection).

The winner of the 1952 national field trial for retrievers was John Olin's labrador, King Buck. Among springer spaniels, the champion of the year was W. T. Gibson's Stubblefield Ace High. J. W. Lipop's silver gray pointer, Bitsu von Basha, took the top title at the championship trial of the Weimaraner Club of America, and J. H. Williams' Brittany, Juchoir's Martin, was awarded top placing at the annual pointing spaniel championship event. The highest greyhound award, winner of the United States challenge cup at Abilene, Kan., was C. E. Evans' Red Flag.

(W. Jv.)

Circuses, Carnivals, Rodeos and Other Travelling Shows.

—The 1952 season was a difficult one for most outdoor shows. Small circuses were especially hard hit. Poor management, inclement weather, high taxes and licence fees, and the presidential election all were advanced as reasons. Of about 40 small truck circuses, two closed early in the season, six closed in September, and the others set unusually early closing dates. The Clyde Beatty circus, one of the two railroad shows on the road, had an unprofitable season and closed a month earlier than usual. The Ringling Brothers-Barnum & Bailey circus, after a tremendous opening stand of 39 days in Madison Square Garden, New York city, and favourable business in Boston, Mass., Washington, D.C., and Philadelphia, Pa., encountered nearly a month of poor business in the industrial towns of New England, New York and Ohio, but throughout the middle west and south drew large crowds. Cole Bros. circus, a railroad show which had disbanded a year before, was purchased by Arthur Wirtz and associates, of the Chicago stadium, but was discontinued as a railroad show. Two small units were formed, one playing fair dates, the other on a carnival midway. The results were poor.

European circuses had a better than average season, especially good in the Scandinavian countries. Circus Moreno, Circus Schumann, Circus Miede and others played long engagements in Copenhagen, Den., Circus Barlay, Belli Bros., Circus Baruk, Willi Holtzmueller circus, and Busch-Berlin circus did well in Berlin, as did Krone circus in Bavaria and the Franz Althoff-Buglione circus in southern Germany. Gock and his tent shows did well in northwestern Germany. In England, the Bertram Mills circus and Tom Arnold's Mammoth circus topped all others. Circuses playing England, France, the Netherlands and Belgium had a good season. Trolle Rhodin's Zoo circus had a profitable season in Iceland. Many circus acts played Helsinki, Fin., during the Olympic games. John Duffy & Sons

circus in Dublin, Ire., and Circus Jose Mullens, Circus Schmidt Bros., Circus Scott, Circus Louis and Circus Benneweis on the continent all reported good business.

Indoor circuses in the United States continued to increase in popularity. Among the established shows playing the principal cities were the Hamid-Morton circus, playing mainly in the east and Canada; Polack Bros. circus, eastern and western units, Shrine dates; Orrin Davenport's circus; and Tom Packs' circus.

Carnivals had one of the most unprofitable seasons in several years, because of unfavourable weather, industrial conditions and restrictions imposed on games. More and more towns were banning the chance games that are a part of most carnivals. Carl Sedlmayr's Royal American show again held top place. Its 1952 route included the five Class A fairs of western Canada and most of the large state fairs of the midwest and south, and the show chalked up a profitable season. Of the three other railroad carnivals, the World of Mirth, playing eastern towns, had a profitable season, but the Amusement Company of America and the Cavalcade of Amusements fell far below 1951. Of the truck shows, Craft's 20 Big on the west coast and the James E. Strates shows in the east were most successful. The 260 or more small truck shows had a poor season.

Interest of the public in rodeos continued to decline. The Madison Square Garden rodeo in New York city drew sizable crowds and showed a profit on its Sept. 24 to Oct. 19 engagement. But of the hundred or more small rodeos staged east of the Mississippi river, few made a profit. Western rodeos continued to hold public interest. High in prize money and attendance were the Calgary (Alta.) Stampede with \$22,260 prize money, and the Cheyenne (Wyo.) Roundup with \$19,200. Other leading rodeos were those at Edmonton, Alta.; Billings, Mont.; Pendleton, Ore.; Pueblo, Colo., and the Will Rogers Memorial rodeo at Vinita, Okla.

Half a dozen automobile thrill shows, units specializing in crashes, roll-overs and other spectacular stunts had a fair season.

Competition among ice skating shows was exceptionally keen during 1952. The leading shows, Shipstads & Johnson's *Ice Follies*, the Sonja Henie *Revue of 1953*, and Arthur Wirtz's *Hollywood Ice Revue* featuring Barbara Ann Scott, all were tremendous spectacles, beautifully costumed, and costing huge sums to produce. Business, on the whole, was good. John Harris' *Icecapades*, George Tyson's *Hollywood on Ice*, and Harris and Tyson's *Icecycles*, medium-sized shows, playing intermediate cities, had only a fair season. The one roller skating show on the road, *Skating Vanities*, never a paying venture, added a large part of the Olsen and Johnson revue late in 1952, and early attendance results indicated a decided upward swing. Sierra Leone: see BRITISH WEST AFRICA.

Sikkim. An Indian-protected state, Sikkim is bounded north by Tibet, east by Bhutan, south by India and west by Nepal. Area: 2,745 sq.mi. Pop. (1951 census): 135,646, mostly Nepalese; also Bhotias of Tibetan extraction (10,980) and Lepchas or Rongpa (13,060) of Indochinese origin. The state religion is lamaistic Buddhism, but most Nepalese are Hindu. Capital, Gangtok. Ruler (from 1914), Maharaja Tashi Namgyal; premier, J. S. Lal.

History.—In May 1952 Jawaharlal Nehru, prime minister of India, visited Sikkim, underlining the Indian government's close interest in the progress of this strategically important border state. At Gangtok Nehru met separately the leaders of the three political parties represented in the provisional government formed in Nov. 1951.

Sonam Chering, leader of the Nationalist party, asked for a

revision of the protectorate treaty signed on Dec. 5, 1950, and put forth a demand that the maharaja of Sikkim should be the supreme constitutional and administrative head of the state. Tashi Chering, leader of the Sikkim Congress party, wanted the maharaja to enjoy the same status as that of an Indian governor of a class A state. The spokesman of the Rajproja Sammelan party demanded that the state administration should be headed by a commissioner appointed by the Indian government.

Finance.—Budget (1951 est.): balanced at Rs. 2,100,000, including the subsidy of Rs. 300,000 from India. Monetary unit=Indian rupee, valued in 1952 at 21 cents U.S.

Silk. Japanese production of raw silk in the first eight months of 1952 was 156,705 bales (of 132 lb. each), compared with 125,044 bales produced in the corresponding period in 1951. For the entire year, world production of silk was expected to reach 55,000,000 lb., an increase of 11,000,000 lb. over 1951 production.

At the third International Silk congress in London in Sept. 1951, the Japanese agreed to a proposal by the important silk-consuming nations that the price of raw silk be stabilized, and in Feb. 1952 the Japanese government established a maximum price of 230,000 yen per bale (\$4.83 per pound) for grade 20/22 A silk, f.o.b. Japan. By June silk prices broke through the ceiling. In early July the Yokohama Raw Silk exchange decided to refrain voluntarily from transactions at prices higher than 240,000 yen per bale. Later in the month the government established 240,000 yen (approximately \$5.10 per pound) as the "prohibition price" (the price above which transactions were illegal) for all grades of silk.

Efforts to promote the use of silk on an international scale continued through the medium of the International Silk association with headquarters in France. In 1952 Japan provided a \$200,000 fund for the promotion of silk in the major consuming countries, while for 1953 the Japanese ministry of international trade and industry asked for an appropriation of \$300,000. The United States was spending \$1,500,000 annually, and Great Britain, Switzerland and France were together contributing another \$500,000 for the same purpose. (See also RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY.)

(I. L. BL.)

Silver. The silver outputs of the world's major producers are shown in Table I, as reported by the U.S. bureau of mines.

United States.—Mine production dropped 7% in 1951 as compared with 1950, to 39,463,661 oz., and continued at about the 1951 level in the first eight months of 1952, with a total of

26,050,181 oz.

Canada.—Silver production rose from 22,386,456 oz. in 1950 to 24,244,949 oz. in 1951.

Mexico.—The world's leading silver producer is Mexico, where the output was 49,141,445 oz. in 1950 and 43,797,734 oz. in 1951. (See also MINERAL AND METAL PRODUCTION AND PRICES.)

(G. A. Ro.)

Singapore. Singapore is a British island colony off the southern end of Malay peninsula with the dependency of Christmas Island in the Indian ocean. Area: Singapore and adjacent islets 220 sq.mi.; Christmas Island 62 sq.mi. Pop.: Singapore Island (1947 census) 938,144, (mid-1951 est.) 1,041,933; Christmas Island (1951 est.) 1,522. Capital, Singapore city (pop. 1947, 769,000). Governors (1952): Sir Franklin Gimson until April, and John Nicoll. U.K. commissioner-general in southeast Asia, Malcolm MacDonald.

History.—Singapore was virtually free of terrorist incidents in 1952, but the authorities suspected that the city was being used as an organizing and supply centre for the conduct of terrorist activities in the Malayan federation, and special steps were taken in August to screen persons passing to and from the federation. Sir Franklin Gimson, the governor, retired in April and was succeeded by John Fearn Nicoll.

Efforts were made in April and June to increase the number of citizens on the electoral register, and as a result 23,000 more persons registered, bringing the total number on the rolls to 75,000 or about 33% of those entitled to register; the proportion of registered men to women was about five to one.

On May 22 a raid by customs officers resulted in the seizure of 500 lb. of illegal opium in a house which was believed to be a transit centre for traffic in opium from Thailand. Later (July 27) the Singapore police authorities disclosed that there were estimated to be 2,000 illicit opium dens in the colony. In August preparations were made for the opening of a government agricultural estate of 2,566 ac. as part of a food production drive. In October it was announced that a surplus of revenue over expenditure for the year of Malayan \$37,000,000 was expected. The program of expenditure on social services had had to be severely cut because of the limited capacity of the public works department. The estimates had depended on a total public works department expenditure of Malayan \$33,000,000 whereas the department's capacity was only Malayan \$10,000,000. (See also MALAYA, FEDERATION OF.)

(D. A. SN.)

Education.—Registered schools (government maintained, aided and private, 1951): English 139 (55,024 pupils), Malay 43 (8,505 pupils), Chinese 288 (75,975 pupils), Tamil 20 (1,272 pupils). One teachers' training college. University of Malaya (Dec. 1951): students 837.

Finance.—Monetary unit: Malayan dollar, valued in 1952 at 32.67 U.S. cents. Budget: (1951 provisional) revenue Malayan \$165,895,917, expenditure Malayan \$113,320,317; (1952 est.) revenue Malayan \$174,836,658, expenditure Malayan \$169,071,159.

Foreign Trade.—Imports (1951) Malayan \$3,625,000,000; exports (1951) Malayan \$4,095,000,000. Main sources of imports (1951): Indonesia Malayan \$1,231,000,000, U.K. Malayan \$453,000,000, India and Pakistan Malayan \$169,000,000, U.S. Malayan \$189,000,000, Thailand Malayan \$195,000,000. Main destinations of exports (1951): Indonesia Malayan \$459,000,000, Australia Malayan \$259,000,000, Hong Kong Malayan \$159,000,000, China Malayan \$83,000,000.

Skating: see ICE SKATING.

Skiing. Andrea Mead Lawrence of Rutland, Vt., scored a sweep of the women's titles at stake in the United States and American international meet held at Stowe, Vt., March 22-23. Mrs. Lawrence regained the national downhill crown the first day when she showed the way in the 1½ mi. descent of Mt. Mansfield in 2 min. 12.9 sec. Mrs. Anne Jones, one of the victor's clubmates from the Pico Ski club, placed second in 2 min. 13.8 sec. The United States Olympian came back the second day to capture the slalom with an elapsed time

ANDREA MEAD LAWRENCE of the U.S. finishing the women's giant slalom in 2 min. 6.8 sec., to win the Olympic skiing event at Norefjell, Nor., in Feb. 1952

of 2 min. 0.6 sec. for the two runs. Lena Gale of Stowe, Vt., was the runner-up. The double victory gave Mrs. Lawrence a perfect score of zero in the competition for the alpine combined title. Miss Gale with 7.26 points placed second.

Ernie McCulloch, instructor at Mont Tremblant, Quebec, Que., retained the men's open downhill laurels, being timed in 2 min. 16.7 sec. Only United States, Canadian and Japanese skiers are eligible for United States titles. Stein Eriksen of Norway was second to McCulloch with Austria's Othmar Schneider third. The national open and amateur slalom honours went to Jack Reddish of Sun Valley, Ida., although he was fourth in the field's standings. Schneider won the international prize with an elapsed time of 2 min. 34.1 sec. Eriksen was second and Gottorm Berge of Norway third. Reddish also gained the United States alpine combined championships with 6.08 points.

Howard Jansen of the Norge Ski club of Chicago, Ill., won the national senior jumping meet at Salisbury, Conn., March 1-2. Jansen scored 186.3 points to defeat a clubmate, Marty Wingsneff, who tallied 180.3. The open event was annexed by Merrill Barber, Brattleboro, Vt., veteran with 236.1 markers. Clarence Hill of Ishpeming, Mich., was second with 233.9 and took the amateur or closed title. Silas Dunklee, Sun Valley star, won the open-closed laurels in the cross-country competition at Paul Smiths, N.Y., March 9. Dunklee triumphed in 1 hr. 30 min. 3 sec., only 34 sec. ahead of the Canadian champion, Claude Richer of Ottawa, Ont. Other national winners in 1952 included Dick Duek of Sun Valley, downhill closed; Corey Engen of Payette Lakes, Ida., combined jumping and cross-country; Gale Spence, Aspen, Colo., giant slalom; and Mrs. Rhona Wurtele Gillis of Palo Alto, Calif., women's giant slalom.

The North American championships were held at Banff, Alta., early in March and Otto von Allman of Sun Valley carried home the slalom and combined trophies, the downhill title being annexed by Bob Dawson of Banff. Jack Roocroft of Vancouver, B.C., was first in the jumping and Clarence Servold of Cambridge, Alta., took the 11-mi. cross-country race. Fritz Pedersen of Seattle, Wash., captured the combined prizes. The women's events were cancelled because of insufficient entries.

Marvin Crawford won the jump, cross-country and slalom to lead Denver university to its second straight team title in the national intercollegiate meet at Snow Basin, Utah, March 29-30. Crawford missed a sweep of the individual championships when he placed second to Utah's Dick Moench in the downhill test. (See also OLYMPIC GAMES.) (T. V. H.)

Skin Diseases: see DERMATOLOGY.

Sloan Foundation, Inc., Alfred P.: see SOCIETIES AND ASSOCIATIONS, U.S.

Smith, Margaret Chase (1897-), U.S. senator, was born on Dec. 14 at Skowhegan, Me. Graduated from the Skowhegan high school in 1916, she taught school in 1916-17 and later worked for a country newspaper. From 1928 to 1930 she was treasurer of a waste process company in Skowhegan and was connected with a textile company. After her marriage in 1930 to a former state senator, Clyde H. Smith, she became active in politics and was a member of the Republican state committee from 1930 to 1936. Her husband was elected to the U.S. house of representatives in 1936, and upon his death she was elected June 3, 1940, to fill his unexpired term. She was re-elected consecutively to the 77th-80th congresses (1941-49). In 1948 she was elected U.S. senator from Maine for the term 1949-55—the only woman member of the senate.

In the house and senate, Mrs. Smith maintained a prolabor record; she also consistently supported the administration's foreign policy and opposed Republican attacks on Secretary of State Dean Acheson. On June 1, 1950, she led six other "liberal Republican" senators in censuring Sen. Joseph R. McCarthy (*q.v.*) for his tactics in exposing alleged Communist sympathizers in the state department and other branches of the government.

After Dwight D. Eisenhower's nomination for president at the Republican convention in July 1952, a move was started to nominate Senator Smith for the vice-presidency but she refused to endorse the action.

Smithsonian Institution. This institution, located on the Mall in Washington, D.C., was established in 1846 through a bequest from James Smithson, an English scientist. Its purpose is "the increase and diffusion of knowledge among men"; this is carried out by means of scientific researches and explorations, publications and museum and art-gallery exhibits. The institution is governed by a board of regents, composed of the vice-president of the United States, the chief justice of the United States, three senators, three representatives and six citizens from various parts of the country. The executive officer is the secretary, who in 1952 was Alexander Wetmore. The institution has ten branches: United States National museum, National Gallery of Art, National Collection of Fine Arts, Freer Gallery of Art, Bureau of American Ethnology, International Exchange service, National Zoological park, Astrophysical observatory, National Air museum and Canal Zone biological area.

The National museum collections were increased by more than 607,000 objects during the year, twice as many as in the previous year, bringing the catalogue entries to a grand total of 33,184,494. Only a small fraction of these could be exhibited; the rest for the most part belonged to the study collections assigned to the museum's six departments: anthropology, zoology, botany, geology, arts and engineering, and history. Field expeditions took National museum staff members to many sections of the United States and to distant parts of the world—Honduras, Dominican Republic, Panamá, Colombia, Brazil.

British North Borneo, Ryukyu Islands, Mexico and Alaska.

The National Gallery of Art received 1,891 accessions by gift, loan or deposit. It held ten special exhibitions during the year. Construction of five new galleries begun in 1950 was completed. A Smithsonian travelling exhibition service was inaugurated. The Freer Gallery of Art acquired choice specimens of Chinese paintings, pottery and bronzes; and Egyptian, Japanese, Persian and Indian objects.

Members of the staff of the Bureau of American Ethnology continued their anthropological researches, particularly on Meso-American archaeology and ethnology, on the archaeology of Cornwallis Island, and on the Iroquois. The River Basin surveys, a unit of the bureau, continued its archaeological work at sites threatened by construction of dams and reservoirs in connection with various river-basin projects in various parts of the country. During 1952, excavation work covered 13 reservoir areas in 11 states, with 22 excavating parties in the field. Another unit of the bureau, the Institute of Social Anthropology, conducted co-operative field work and teaching programs in Brazil, Colombia, Mexico and Peru, and also participated in public-health programs in Latin America.

The Astrophysical observatory continued its studies of solar radiation at its two high-altitude stations on Mt. Montezuma, Chile, and Table mountain, California. The observatory's division of radiation and organisms continued its biochemical investigations pertaining to the photomorphogenesis in green plants.

The National Air museum was obliged to move its storage facility from Park Ridge, Ill., and erection of several prefabricated buildings to house the 4,000 aeronautical specimens in storage was begun at Suitland, Md., near Washington, D.C. During the year 110 specimens from 21 sources were received for the aeronautical collections.

The collection of animals in the National Zoological park numbered 2,675. The year's accessions brought some species never before shown in this zoo, including an Australian copperhead, an albino great gray kangaroo, a Bornean porcupine and a pair of MacQueen's bustards.

The International Exchange service handled 1,001,614 packages (weighing about 825,000 lb.) of scientific and governmental publications, serving as the United States agency for the interchange of such material with other countries.

A new laboratory building, begun in 1951 at the Canal Zone biological area on Barro Colorado Island, Pan., was completed.

The institution issued 76 publications during the year, especially noteworthy among them being Goldman's *Biological Investigations in Mexico*; Rasetti's *Middle Cambrian Stratigraphy and Faunas of the Canadian Rocky Mountains*; the Clarks' *Butterflies of Virginia*; Tattersall's *The Mysidacea of the United States National Museum*; Fenton's *Local Diversity in Iroquois Culture*; and two volumes in the institution's series of tables—the sixth revised edition of the *Smithsonian Meteorological Tables*, compiled by Robert J. List, and the *Smithsonian Logarithmic Tables, to Base e and Base 10*, by Spenceley, Spenceley and Epperson. The Smithsonian library, including its various branches, numbered about 939,000 volumes.

Recorded visitors to the Smithsonian group of buildings reached an all-time high total of 3,425,987 for the year; to the National Gallery of Art, 1,522,596; and to the National Zoological park, approximately 3,300,000. (A. Wt.)

Snyder, John Wesley (1896–), U.S. secretary of the treasury. was born on June 21 in Jonesboro, Ark. He attended Vanderbilt university, Nashville, Tenn. (1914–15), joined the army in 1917, and after World War I entered the banking business in Arkansas and Missouri. In 1931 he joined the field service of the comptroller

of the currency of the U.S. and served with this office until 1937, when he became head of the St. Louis, Mo., agency of the Reconstruction Finance corporation. During World War II he helped organize the Defense Plant corporation, an RFC subsidiary, and as its operational vice-president and director he administered the agency's commitments of more than \$10,000,000,000 to finance war plants. He was vice-president of the First National bank of St. Louis from Jan. 1943 to April 1945 when he became federal loan administrator. On July 17, 1945, he was appointed director of the Office of War Mobilization and Reconversion, and in June 1946, Pres. Harry S. Truman named him secretary of the treasury. It was Snyder's responsibility in the cabinet to steer through congress the bills to implement vast increases in government and defense expenditure after the outbreak of the Korean war in 1950. On May 29, 1951, Snyder was nominated for a second five-year term as U.S. governor of the International Monetary fund and the International Bank for Reconstruction and Development. He was a member of the U.S. staff attending the North Atlantic Treaty organization meeting at Lisbon, Port., in Feb. 1952.

Snyder declared on April 18, 1952, that there was no danger of an economic depression in the United States, even after curtailment of expenditures for national defense.

Soaring: see GLIDING.

Soccer. Play for the National Challenge cup in 1951–52 attracted 91 entries including the Los Angeles Scots, first team ever to represent the Pacific coast in the competition. The prized trophy was won by the Harmarville eleven of Pitts-

U.S. GOALKEEPER leaping to save the ball during the Olympic soccer match against the Italian team, played at Tampere, Fin., in July 1952. The U.S. team lost the match 8 to 0

burgh, Pa. The new champions had gained the last round by eliminating the St. Louis Simpkins, 0-0, 2-1, in the western play-offs, while the Philadelphia Nationals reached the grand final by halting the defending German-Hungarian Soccer club of Brooklyn, 2-1, 2-2, to advance on the total goal basis. Harmarville then annexed the cup, 7 goals to 5, by conquering the Nationals, 3-4, 4-1, in June. The National Amateur cup was won by the St. Louis Raiders when they set back the Lusitano eleven of Ludlow, Mass., 3-1, in a single play-off. The Philadelphia Americans took top honours in the American league race and the Philadelphia Nationals captured the Lewis cup by defeating the New York Americans, 2-1.

Visits by Manchester United, the English league champions, the Stuttgart Kickers of Germany and the Tottenham Hotspurs of England spiced the season in the United States. Manchester proved the big lure for soccer enthusiasts after defeating Stuttgart in New York city and twice halting the Atlas Football club of Mexico in Los Angeles, Calif. However, the high mark of the trip came at New York on June 15 when a crowd of 25,000 at the Yankee stadium saw Tottenham beat Manchester, 7-1. The day before at Toronto, Ont., Tottenham had blanked its English league rival, 5-0, as 26,000 looked on. (See also FOOTBALL.)

(T. V. H.)

Socialism. Socialists and Labourites furnished the leadership in 1952 in socialist and coalition governments of Burma, Israel, the Netherlands, Norway and Sweden and in the province of Saskatchewan, Can. They were represented in the coalition cabinets and councils of Austria, Finland, Switzerland and Indonesia, and constituted the chief opposition parties in Australia, Belgium, Denmark, France, Germany, Great Britain, India and New Zealand. In all of these countries, the parties were confronted with the difficult problem of how to maintain living standards for the masses, to continue and strengthen the social services and, at the same time, to provide the necessary funds for rearmament as a defense against possible Communist aggression.

Socialist International.—The reorganized Socialist International, under the chairmanship of Morgan Phillips, secretary of the British Labour party, held its second congress in Milan, It., in October. The international reported that 34 Socialist parties and exiled groups with a membership of 10,000,000 and a following at the polls of 55,000,000, were affiliated with it, and that it was in contact with 37 other socialist organizations.

At this congress, it appealed to the four powers in occupation of Germany "to redouble their efforts to convene a four-power conference with the object of reuniting the Western and Eastern zones of Germany under a single government, on the basis of completely free elections under international control in the whole of Germany."

The congress declared that countries adhering to the Atlantic pact should "hasten the establishment of a real Atlantic community which is not only military but economic and political as well." It urged the United Nations to abolish the veto power, and opposed Spain's admission into the United Nations Educational, Scientific and Cultural organization.

Great Britain.—The parliamentary Labour party in Great Britain spent much of its energy during the year in opposing the Conservative party's tax program, its attempt to restore the steel industry and road haulage to private hands, and its proposal to charge for prescriptions, dental care and some appliances obtained under the national health service.

At its annual conference at Morecambe, the party urged the expansion of the sphere of co-operative and municipally and federally owned industry; declared that Great Britain should do all within its means to defend itself; and advocated periodic review of the rearmament program with the Allies.

The annual conference was also the scene of a contest for party control between the moderates, led by Clement R. Attlee, and the left wing, led by Aneurin Bevan. In the voting for the 7 members of the executive committee elected by Labour party branches, the Bevanites won 6 of the 7 places and defeated for re-election Herbert Morrison and Hugh Dalton. The Attlee followers, however, backed by the trade union representatives, retained majority control of the executive. Following the conference, the Bevan group was ordered to disband as an organized group.

In the parliamentary by-elections in the fall, Labour's candidates in Labour constituencies were re-elected, but with a reduced majority.

Europe.—The Swedish Social Democratic party and the Norwegian Labour party remained as the leaders of their respective governments, and the Danish Social Democratic party continued as the chief opposition. In the Oct. 21 elections to the lower house of the Swedish *riksdag*, the Social Democrats again won the largest number of seats, 110 out of 230, as compared with 112 in the old parliament, and obtained 46% of the popular vote. Following the election, the Social Democrats continued their coalition cabinet with the Agrarians.

In the Netherlands, William Drees, head of the Labour party, continued throughout the year as prime minister, in a coalition government. In the quadrennial parliamentary elections in late June, the Labour party, for the first time, obtained a plurality of votes, 1,545,414, against 1,529,424 for the Catholic party, and won 30 out of 100 seats compared with 27 in 1948. The Catholics also elected 30, a reduction of 2.

In Belgium, the Socialists, the chief opposition party, in the municipal elections of October, improved their representation over the votes received by them in 1946 by from 10% to 15%.

In early 1952, the French Socialist party, with a parliamentary block of 107, remained out of the successive cabinets.

As a result of the May elections for the senate, Socialists were represented in that body by 56 members (formerly 61); Communists by 16 (formerly 18), out of a total of 320. Socialists came second to the R.G.R. (Rally of the Republican Left), represented by 71 members.

At the meeting of the French Socialist national council in November, party spokesmen vigorously condemned the "reactionary trend" in the Antoine Pinay cabinet. They denounced the war in Indochina and the admission of the Spanish government to U.N.E.S.C.O. and asked that peace negotiations be started with the Communist-led Viet Minh. They also urged the government to seek closer Allied control of Nazi elements in west Germany.

In Germany, the Social Democrats continued during the twelve months to gain strength. In the March elections in the southwest state, they increased their votes from 23.9% in 1949 to 28.1%. In the municipal election in Hesse, they obtained 38.5% as compared with 17.8% for the Christian Democrats, and in the fall communal elections in North Rhine-Westphalia, the most populous state of western Germany, and in Lower Saxony, the Social Democrats emerged as the strongest party.

The party throughout the year opposed rearmament without equality of status, and insisted that the unification of Germany come before the inclusion of Germany in a European Defense Community.

In Austria, where the Socialist party had been a member of the coalition government with the People's party since 1945, the party's representatives withdrew from the cabinet on Oct. 22 because of disagreement over the budget, but, at the request of Pres. Theodor Koerner, agreed to continue with the People's party as a provisional government until the next election.

The first convention of the Democratic Socialist party of

Italy, a merger of the Italian Workers' Socialist party led by Giuseppe Saragat and various Socialist Unity groups headed by Giuseppe Romita, met in Bologna in Jan. 1952. The delegates favoured continued nonparticipation in the government coalition for the time being, nonco-operation with the Pietro Nenni left-wing Socialist party, which collaborated with the Communists, and support for the Atlantic pact.

The September convention of the party voted for an electoral alliance with the Christian Democrats, Liberals and Republicans for the ensuing elections.

Near and Far East.—The parliamentary elections in Japan on Oct. 1 resulted in the election to the diet of 57 right-wing Socialists and 54 left-wing Socialists. The Liberals won 240 seats; the Progressives, 85; the Communists, 0; and the Independents, 30.

In the January elections in India, the Socialist party received more than 10,000,000 votes (11% of the total), although electing but 12 representatives out of 489. The Communists, with 4.9% of the total, elected 23 deputies. In the fall, the Socialist party voted to merge with the Kisan Mazdoor Praja party, which polled 6% of the total, forming the Socialist-Praja party. The merger was based on the Socialist party's condition of "no alliance with the Communists."

In Burma, the socialistic Anti-Fascist People's Freedom league received a large majority of votes in the spring elections. The prime minister reaffirmed the government's opposition to Communists, and its advocacy of welfare state plans. In Malaya, an all-Malayan Labour party was formed in late June.

The Australian and New Zealand Labour parties remained the chief opposition parties in their respective countries.

United States.—In the United States, the Socialist party ran Darlington Hoopes, a Reading, Pa., attorney, as candidate for president, and Samuel H. Friedman for vice-president. The platform called for greater measures of socialization and social security, the strengthening of the U.N. and the Socialist International, and the ending of the arms race. The Social Democratic Federation voted endorsement of the candidacy of Adlai E. Stevenson, at the same time urging the development of a new labour-progressive-democratic socialist alignment. A vigorous discussion continued within the Socialist party during the year regarding the extent to which the party should continue to nominate and run Socialist candidates for political office.

Latin America.—In Latin America, the Socialist movement continued weak during the year. In many countries, it came under the official ban of a dictatorial government. Only in Chile, Peru and Uruguay did it have parliamentary representation. (See also COMMUNISM; DEMOCRACY.) (H. W. L.; N. T.)

Socialist Soviet Republics: see UNION OF SOVIET SOCIALIST REPUBLICS.

Social Security. Steady and more or less gradual increases in social security benefits, with other liberalizations, were put into effect during 1952 in many countries, including the United States. Chile completely reorganized its health and pension program for wage earners, and Italy strengthened its retirement system. The United Nations developed further its program of advisory social welfare services.

United States.—The social security program was made more liberal by congressional action in July 1952. Old-age and survivors insurance benefits were increased and eligibility conditions liberalized, and additional federal funds were made available to the states to help provide care under their public assistance programs for needy persons. The railroad retirement program, liberalized by amendments made late in 1951, pro-

vided a degree of co-ordination between that program and old-age and survivors insurance.

Social Insurance and Related Programs.—The federal old-age and survivors insurance program, administered by the Social Security administration of the Federal Security agency, provides monthly benefits related to previous earnings for insured, retired workers at age 65 and supplementary benefits to their dependent, minor children; to their wives if aged or having such entitled children in their care; and to the dependent, aged husbands of women workers. The program also pays survivor benefits to the widows and children, dependent parents and dependent, aged widowers of deceased, insured workers, as well as lump-sum death payments. At the end of July 1952 monthly benefits totalling \$162,300,000 were being paid to 4,600,000 persons. As of Dec. 31, 1951, the average monthly benefit for a family consisting of a widowed mother and one child beneficiary was \$77.30; for an aged widow \$36; for a retired man \$43.20; and for a man and his aged wife \$70.20.

Effective Sept. 1952, under the Social Security act amendments of 1952, retired persons already on the rolls received, in general, increases in their benefit payments of \$5 or 12½%, whichever was larger; other beneficiaries received proportionate increases. The benefit formula for persons coming on the rolls in the future was also liberalized. Beneficiaries under age 75 may earn up to \$75 a month (\$50 before the amendments) in covered employment and continue to receive benefits.

The program is financed by contributions from employers and employees of 1½% each on wages up to \$3,600 a year; the self-employed (except farmers and members of specified professions) contribute 2½% of earnings up to \$3,600. In June 1952, 46,000,000 persons were in covered employment, exclusive of railroad employment.

Payments were also being made under other public programs. In July 1952 monthly retirement, disability and survivor benefits were being paid to beneficiaries under the railroad retirement program (507,200), veterans' programs (3,468,600) and the federal civil service (217,100). Programs for state and local government employees were paying retirement, disability and survivor benefits to a large group of beneficiaries. For temporary disability that was not work-connected, benefits were paid in four states and in the railroad industry. For work-connected disability, workmen's compensation programs were in effect for workers in all states and for federal employees.

The state-federal system of unemployment insurance pays benefits, financed by employer contributions, to qualified unemployed workers. The federal aspects of the program are administered by the department of labour. In July 1952 a weekly average of 870,900 unemployed workers drew benefits; total benefits in the month were \$88,612,000. Workers in 11 states had their weekly benefits supplemented by small allowances for their dependents. Under the Railroad Unemployment Insurance act about \$6,128,000 was paid in July 1952 to an average (in a 14-day period) of 68,600 railroad workers.

Assistance and Welfare.—The four special types of public assistance—old-age assistance, aid to dependent children, aid to the blind and aid to the permanently and totally disabled—are administered by the states or the local communities or both; the federal government shares in the costs within certain maximum amounts. Federal grants to the states for these programs in the fiscal year 1951-52 amounted to \$1,177,687,600; expenditures—federal, state and local—for assistance and administration of the four programs totalled about \$2,300,000,000. In July 1952, 2,648,641 needy persons aged 65 or over were receiving old-age assistance; the average payment was \$45.51; 2,004,154 persons (including 1,499,325 children in 577,780 families) were receiving aid to dependent children (average

payment per family, \$76.44); 97,635 were receiving aid to the blind (average payment, \$50.62); and 147,206 persons in 39 reporting states were receiving aid to the permanently and totally disabled (average payment, \$46.44). About 303,000 cases were receiving general assistance, financed by states and localities without federal funds; the average payment was \$48.35.

A change in the grant formula for the public assistance programs under the 1952 amendments made it possible for the states to pass on to assistance recipients additional federal funds amounting to \$5 a month for each aged, blind and disabled person and \$3 a month for each recipient of aid to dependent children. The provision, effective Oct. 1952, was scheduled to terminate in Sept. 1954.

The Social Security act also authorized federal grants to the states, administered by the children's bureau, to extend and improve their maternity services for mothers and their health and welfare services for children, including services for crippled children. During the year ended June 30, 1952, \$12,676,790 was paid to the states for maternal and child health services. Federal payments to the states for services for crippled children totalled about \$11,111,240; the programs provided diagnostic, medical and surgical services and hospital and convalescent care. Federal payments of about \$7,245,417 were made for child welfare services. (See also under article on each state.)

(A. J. A.)

Canada.—The national health and welfare minister, Paul Martin, estimated that in 1952 Canadian governments and voluntary agencies would spend \$1,330,000,000 on social security. Federal social security payments made during 1951 for health and hospital care, labour and unemployment insurance, unemployment relief, old-age and blind pensions, family allowances, veterans' pensions and benefits totalled \$670,503,000, compared with \$127,918,000 in 1944; provincial social security payments for health and hospital care, labour and unemployment relief, old-age and blind pensions totalled \$255,456,000, compared with \$75,462,000 in 1944. In 1952 federal family allowances went to the heads of 1,990,000 families and amounted to \$332,150,000; pensions, allowances and other payments went to 194,000 veterans and amounted to \$166,200,000.

The 1952 session of the federal parliament made extensive overhaul of the unemployment insurance act; amendments included an increase in rates of benefit, a reduction in the number of waiting days, an increase in the penalties for misrepresentation and provision for nondiscrimination by the employment service in referring workers for employment.

Ontario led the way in legislation to pay pensions to completely and permanently disabled persons; but only Alberta and Saskatchewan recommended immediate adoption of a national health insurance program.

(C. Cy.)

Other Countries.—The main alteration in the national insurance and ancillary schemes in Great Britain during 1952 was the increasing of family allowances, unemployment and sickness benefits, widows' and retirement pensions and national assistance rates necessitated by the increase in the cost of living. In Belgium supplementary and temporary allowances were made to the recipients of incapacity, invalidity and unemployment allowances. In France, the allowances to aged workers were increased. In Switzerland new legislation was enacted which increased minimum benefits and prolonged the benefit period. In Hungary legislation was passed under which a pension was granted to each wage-earning worker who reached the prescribed age limit. The International Labour conference adopted a convention to assure a certain minimum standard of social security protection to those living in different countries which was referred for ratification to the countries concerned. A model convention on social security was also drawn up under the

Brussels treaty permanent commission.

The report of the ministry of national insurance in Great Britain for 1951 was published and showed that at the end of 1951 207,000 persons were in receipt of unemployed benefits and about 33,000 in receipt of national assistance only, compared with 209,000 and 27,000 respectively at the end of 1950. There were about 400,000 men and women who had reached pensionable age and had not yet retired, so qualifying for increments to the pensions which would be payable on their ultimate retirement. About 3,100,000 families containing nearly 8,000,000 children were receiving family allowances. The annual report of the National Assistance board showed that 1,461,626 persons were receiving assistance at the end of 1951.

Most insured persons in Great Britain can continue contributing to the general national insurance scheme when they go abroad and thus maintain their benefit rights. In 1952 about 17,000 persons overseas were paying contributions direct to the ministry of national insurance and many others arranged for their friends to stamp cards for them while they were away. Approximately 18,000 retired pensioners were receiving their pensions overseas and about 5,000 persons abroad were receiving sickness and injury benefit for limited periods. New agreements on reciprocal benefits were made with Guernsey and Italy, and a further agreement with France. Negotiations with other European and commonwealth countries continued. An agreement previously negotiated between France and the Federal Republic of Germany came into operation. A new convention between Denmark and France provided for the rights of aged persons.

The only important alteration in the administration of the British national health service was the imposition of a charge of 1s. for each prescription dispensed by a chemist. This brought into operation a scheme for which legislative sanction had been obtained by the former Labour government. The average cost of each prescription was estimated at nearly 4s.

The National Council of Social Service continued, in association with its various affiliated bodies, to assist with voluntary efforts in the administration of the social services but experienced increasing difficulty in raising enough funds to meet its administrative expenses. Some government grants made to voluntary organizations were reduced or discontinued.

Social Service: see CHILD WELFARE; SOCIAL SECURITY.

Societies and Associations, U.S. The following is a selected list of U.S. societies and associations, with date of founding, membership, officers and chief activities during 1952. (See also the separate articles on RED CROSS; VETERANS' ORGANIZATIONS; etc.)

Alcoholic Foundation, Inc. (Alcoholics Anonymous).—Alcoholics Anonymous is a fellowship of men and women organized in 1935 to help the alcoholic recover. The only requirement for membership is stated to be "an honest desire to stop drinking." In 1952 there were 120,000 members in 4,500 groups throughout the world. The foundation, which was organized in 1938, is a nonprofit membership corporation serving as a general service board for the Alcoholics Anonymous movement. It publishes the book *Alcoholics Anonymous*, the monthly *The A.A. Grapevine* and various pamphlets. Officers' names are not given because of the organization's tradition of anonymity. It is supported solely through voluntary contributions. Headquarters: P.O. Box 459, Grand Central Annex, New York 17, N.Y.

American Academy of Arts and Letters.—The purpose of the academy, founded April 23, 1904, is "furthering the interests of literature and the fine arts in America." The academy consists of 50 members chosen from the 250 members of its parent organization, the National Institute of Arts and Letters. At the joint annual ceremonial held May 28, 1952, new members were inducted and honours and awards were conferred. An exhibition in honour of Sinclair Lewis was held in the museum of the academy, February-March 1952. Its publications include *Proceedings*, an annual, and *Yearbook of the National Institute and the American Academy*. Officers (1952): Paul Manship, president; Archibald MacLeish, chancellor; Mark Van Doren, secretary; Deems Taylor, treasurer. Headquarters: 633 W. 155th St., New York 32, N.Y.

American Academy of General Practice.—The academy was founded in

1947 to improve the professional abilities of physicians through postgraduate study, to gain for them wider opportunities for the practice of those abilities in U.S. hospitals and to assure the family doctor of a better understanding on the part of the public and the rest of the medical profession of his role in medical care. Membership, which is open to all physicians engaged in the general practice of medicine and surgery, numbered 15,773 in 1952. The Annual Scientific assembly was held in Atlantic City, N.J. The academy has no endowment, its activities being supported by membership fees. Publication: "GP" (monthly). Officers (1952) included: R. B. Robins, Camden, Ark., president; U. R. Bryner, Salt Lake City, Utah, president-elect; M. F. Cahal, Kansas City, Mo., executive secretary. Headquarters: 406 W. 34th St., Kansas City 2, Mo.

American Academy of Political and Social Science.—Founded in 1889 and incorporated in 1891, this organization acts as a forum for the discussion of social, political and economic questions through meetings and publications. Membership in 1952 was approximately 16,500. Publication: *The Annals*, a bimonthly journal. Officers (1952): Ernest M. Patterson, president; J. P. Lichtenberger, secretary. Headquarters: 3937 Chestnut St., Philadelphia 4, Pa.

American Association for the Advancement of Science.—Founded in 1848, this association seeks to further the work of scientists, facilitate co-operation among them and improve public understanding of the importance of science in human progress. Its membership in 1952 was 48,500. During 1952 the annual Exposition of Science and Industry was held in St. Louis, Mo., Dec. 27-30. Publications: *Science*, weekly; *Scientific Monthly*; and others. Officers (1952): Detlev W. Bronk, president; Howard A. Meyerhoff, administrative secretary. Headquarters: 1515 Massachusetts Ave. N.W., Washington 5, D.C.

American Association of Law Libraries.—Founded in 1906 to cultivate the science of law librarianship and increase the usefulness of law libraries, this association in 1952 numbered 600 members. During 1952, it assembled a classification plan for law libraries and continued a study of cataloguing rules adapted to law libraries. Publications: *Law Library Journal*; *Index to Legal Periodicals*; *Law Libraries of the U.S. and Canada*. Officers (1952): Forrest S. Drummond, president; Elizabeth Finley, treasurer; Frances Farmer, secretary. Headquarters: University of Virginia Law Library, Charlottesville, Va.

American Association of University Professors.—This organization of college and university teachers was founded in 1915 to promote discussion and action on problems affecting education in institutions of higher learning, and to provide means for expression of its membership. Its membership in Jan. 1952 was 42,263. Publication: the *Bulletin*, a quarterly journal. Officers (1952): Fred B. Millett, Wesleyan university, president; Ralph E. Himstead, general secretary. Headquarters: 1785 Massachusetts Ave. N.W., Washington 6, D.C.

American Association of University Women.—This organization was founded in 1882 as the Association of Collegiate Alumnae for "the uniting of the alumnae of different institutions for practical educational work." Membership in 1952 totalled 122,127. For 1952-53 the association offered 34 graduate fellowships, \$1,500 to \$3,000 each, to women scholars for advanced research; 57 women from 20 countries were awarded grants covering expenses of study in the U.S. The number of approved colleges and universities whose graduates were eligible for A.A.U.W. membership totalled 313 in 1952. Publications: *Journal*, quarterly, the *General Director's Letter*, handbooks, study guides and bibliographies. Endowed funds totalled \$1,101,269 in 1952. Officers (1952): Susan B. Riley, president; Mrs. Arthur J. White, treasurer; Mrs. Charles Sidney Bluemel, recording secretary. Headquarters: 1634 I St. N.W., Washington 6, D.C.

American Bankers Association.—Founded in 1875, the primary objective of this organization is to promote the general welfare and usefulness of banks and financial institutions. In 1952 it had a membership of 16,790 banks and banking offices. In its four divisions it operated through about 40 working groups. It is the parent organization of the American Institute of Banking for bank employees and the Graduate School of Banking for bank officers. In 1952, banks operated under government controls and credit restraints, and the association continued a nation-wide voluntary credit restraint program. This program was abandoned at midyear when credit restraints on consumer instalment buying and home mortgage loans were abolished by the Federal Reserve board. Officers elected in Oct. 1952 included: W. Harold Brenton, State Bank of Des Moines, Ia., president; Everett D. Reese, Park National bank, Newark, O., vice-president; William B. Gladney, Fidelity National bank, Baton Rouge, La., treasurer. Headquarters: 12 E. 36th St., New York, N.Y.

American Bar Association.—Founded in 1878 to advance the science of jurisprudence and promote the administration of justice in the U.S., the association had a membership of about 48,000 at the close of 1952. The annual medal for conspicuous service to U.S. jurisprudence was awarded in 1952 to Harrison Tweed of New York city; the Ross prize went to R. Dean Moorhead of Austin, Tex., for his essay "The Function of Concurring and Dissenting Opinions in Courts of Last Resort." Its publications include the *American Bar Association Journal*, an annual volume of reports and proceedings, and various pamphlets. Officers (1952) included: Robert G. Storey, Dallas, Tex., president; David F. Maxwell, Philadelphia, Pa., chairman of the house of delegates; Joseph D. Stecher, secretary; and Harold H. Bredell, treasurer. Headquarters: 1140 N. Dearborn St., Chicago 10, Ill.

American Bible Society.—Founded in 1816, the society encourages the wider circulation and use of the Holy Scriptures without note or comment and without purpose of profit. In 1952 manuscripts of the Scriptures in primitive languages were studied, and special committees were engaged in revising the Japanese Old Testament and the Spanish and Portuguese Bibles. In 1951, the Bible in three African languages and an illustrated edition in English of the *Acts of the Apostles* were published; 16,001,945 copies of the Scriptures were distributed throughout the world. Membership (1952): 300,000. Publication: *The Bible Society Record*. Officers (1952): Eric M. North, Frank H. Mann and Robert T. Taylor, general secretaries; Francis C. Stifter, recording secretary; Gilbert Darlington, treasurer. Headquarters: 450 Park Ave., New York 22, N.Y.

American College of Dentists.—The association was formed Aug. 20, 1920, to advance the standards and efficiency of dentistry, stimulate graduate study in dentistry, confer fellowships in recognition of meritori-

ous achievement especially in dental science, art and literature, and improve public understanding of oral health service. Membership in 1952 was 1,805. Activities throughout 1952 included the development of a motion picture, *Dentistry as a Career*; a preventive service program; and a medico-dental relations program. Publication: *Journal of the American College of Dentists* (quarterly). Officers (1952): W. C. Fleming, San Francisco, Calif., president; E. N. Bach, Toledo, O., vice-president; Otto W. Brandhorst, St. Louis, Mo., secretary. Headquarters: 4952 Maryland Ave., St. Louis, Mo.

American College of Life Underwriters.—Founded in 1927 to establish an educational standard for the profession of life underwriting and to encourage formal training for this field, the organization awards qualified candidates a professional certificate of recognition. By 1952, 4,470 had been awarded this certificate (C.L.U.) and 136 had been made C.L.U. Associates. In June 1952, 2,539 candidates took examinations for the certificate at 137 regional centres, and a total of 3,388 tests were taken during the year. A total of 4,786 persons had completed the five examinations necessary for the certificate, and 6,380 others had credit for one or more of the examinations. Publications: *Announcement*, *Annual Report* and brochures. An endowment of \$42,000 was raised in addition to about \$68,000 received annually from contributing life insurance companies. Officers (1952): Julian S. Myrick, chairman of the board; David McCahan, president; Joseph H. Reese, secretary. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American College of Physicians.—This society was founded May 11, 1915, to bring together physicians of high standing for the maintenance and advancement of medical education, practice and research. Activities in 1952 included the 33rd annual session in Cleveland, O., April 21-25, plus 23 regional or state meetings; 17 postgraduate courses were conducted in various parts of the U.S. The college also awarded six research fellowships and, in conjunction with the W. K. Kellogg foundation, 16 Latin-American fellowships for training Latin-American men for teaching and research in their homelands. Membership in 1952 totalled 7,350. Publications include a directory and *Annals of Internal Medicine* (monthly). Endowment funds totalled \$377,000. Officers (1952): T. Grier Miller, Philadelphia, Pa., president; Richard A. Kern, Philadelphia, secretary-general; Edward R. Loveland, Philadelphia, executive secretary. Headquarters: 4200 Pine St., Philadelphia 4, Pa.

American College of Surgeons.—Founded in 1913 to advance the science of surgery, the organization held its 38th clinical congress in New York city, Sept. 22-26, 1952. The Inter-American session was held Jan. 16-18 in Panamá city, Panamá. Membership of the college in 1952 was 17,414. Publications: *Surgery, Gynecology and Obstetrics* and the *Bulletin*. Officers (1952): Alton Ochsner, president; Paul R. Hawley, director; Michael L. Mason, secretary. Headquarters: 40 E. Erie St., Chicago 11, Ill.

American Dental Association.—Founded in 1859 "to encourage the improvement of the health of the public and to promote the art and science of dentistry," this professional association numbered 77,447 members as of Nov. 30, 1952. It continued support of measures to add fluoride salts to community water supplies to reduce incidence of tooth decay, and by Dec. 1952, more than 500 U.S. cities and towns were fluoridating their water supplies. The association in February sponsored its fourth annual national children's dental health day. Its council issued a report calling attention to the serious financial plight of the nation's 42 dental schools. Publication: *Journal of the American Dental Association*. Officers (1952-53): Otto W. Brandhorst, president; Harold Hillenbrand, secretary; H. B. Washburn, treasurer. Headquarters: 222 E. Superior St., Chicago 11, Ill.

American Dialect Society.—This organization was founded at Harvard university in 1889 to collect, study and publish material on the English language, especially dialect as found in North America, together with other languages influencing it or influenced by it. In 1952 meetings were held in Boston, Mass., and Miami, Fla. Membership in 1952 was 610. Publications: *Dialect Notes*, 1890-1939 (6 vol.); *Publication of the American Dialect Society* (1944-). Officers (1952): E. H. Criswell, president; Thomas Pyles, secretary-treasurer. Headquarters: University of Florida, Gainesville, Fla.

American Economic Association.—This association, which in 1952 had 7,400 members and 2,700 library, corporate and individual subscriptions, was founded in 1885 to encourage economic research and freedom of economic discussion, and to issue publications on economic subjects. The annual meeting, a joint session with the Allied Social Science associations, was held in Chicago, Ill., Dec. 27-29, 1952. Publications include the *American Economic Review* (quarterly); *Papers and Proceedings* of the annual meeting; and a directory. Officers (1952): Harold A. Innis, University of Toronto, president; James Washington Bell, Northwestern university, secretary-treasurer and editor of the annual proceedings; Bernard F. Haley, Stanford university, managing editor of the quarterly. Headquarters: Northwestern University, Evanston, Ill.

American Geographical Society.—This organization was founded in 1852 to promote geographical research and exploration and to disseminate geographical knowledge. During 1952, the centennial year of the society, a convocation day was celebrated on May 22 with the opening of an exhibit at the society's headquarters; an open house was held Aug. 4-6 for geographers from all over the world who attended the International Geographic congress. Publications include: *Geographical Review*, quarterly; *Current Geographical Publications*; *Focus*; and *Geography in the Making*, a history of the society. Membership (1952): about 4,500. Officers (1952): Richard Upjohn Light, president; George H. T. Kimble, director. Headquarters: Broadway at 156th St., New York 32, N.Y.

American Historical Association.—This association of professional and nonprofessional students of history, founded in 1884, was organized "for the promotion of historical studies, the collection and preservation of historical manuscripts, and for kindred purposes in the interests of American history. . . ." It was incorporated by act of congress in 1889. The association's membership in 1952 was about 6,000, and its endowment was about \$350,000. Publications include the *American Historical Review*, *Annual Report* and selected historical monographs. Officers (1952): James G. Randall, University of Illinois, president; Guy Stanton Ford, Washington, D.C., executive secretary. Headquarters: Study Room 274, Library of Congress Annex, Washington 25, D.C.

American Institute for Property and Liability Underwriters, Inc.—Founded in 1942, this organization was organized to establish an educational standard for the profession of property and casualty insurance underwriting. In June 1952, 1,498 persons took examinations which are held by the institution for certification of underwriters; 1,946 persons had credit for one or more of the five examinations which were held at 116 universities and colleges in 39 states, the District of Columbia and Germany. By 1952 a total of 878 examinees had received the C.P.C.U. designation. The institute receives \$25,000 annually from property and casualty insurance companies and additional funds from other insurance organizations. Publication: *Announcement*, annual, and *C.P.C.U.—Its Meaning and Purpose*. Officers (1952): S. S. Huebner, chairman, board of trustees; C. R. McCotter, president; A. C. Goerlich, secretary. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American Institute of Accountants.—A national professional society of certified public accountants, founded in 1887 to maintain high professional and ethical standards, to develop accountancy education and to provide for the examination of candidates for membership. In 1952 the institute had a membership of 19,593. The year's activities included the preparing of the uniform C.P.A. examinations given in 48 states, the conducting of local and regional meetings, the issuing of bulletins on accounting procedure and case studies in auditing procedure, and recommendations for improvement of federal income-tax laws. Publications: *Journal of Accountancy* and *Certified Public Accountant*, both monthly, and others. Officers (1953) included J. A. Phillips, president; John L. Carey, executive director. Headquarters: 270 Madison Ave., New York 16, N.Y.

American Institute of Architects.—The objects of this organization, founded in 1857, are "to promote the aesthetic, scientific and practical efficiency of the architectural profession; to advance the standards of architectural education, training and practice; and to coordinate the building industry and the profession of architecture." The organization's annual convention was held in New York City, June 23-27, 1952. Membership in 1952 was 9,100. Publications: *Journal*, monthly; *Bulletin*, bimonthly; and *Memo*, biweekly. Officers (1952) included: Glenn Stanton, Portland, Ore., president; and Clair W. Ditchy, Detroit, Mich., secretary. Headquarters: 1741 New York Ave. N.W., Washington 6, D.C.

American Institute of Chemical Engineers.—This organization was founded in 1908 for the advancement of chemical engineering in theory and practice and the maintenance of a high professional standard among its members. Activities in 1952 included the annual meeting at Cleveland, O., Dec. 7-10, and three regional meetings. As of April 30, 1952, the membership was 11,770. Publication: *Chemical Engineering Progress* (monthly). Officers (1952) included William I. Burt, president; Stephen L. Tyler, executive secretary. Headquarters: 120 E. 41st St., New York 17, N.Y.

American Institute of Electrical Engineers.—This association was founded in 1884 to advance the theory and practice of electrical engineering and of allied arts and sciences and to maintain a high professional standing among its members. Its 1952 activities included four general and three district meetings; participation in the Centennial of Engineering held in Chicago, Ill., in September; and 3,000 meetings of sections and student branches. There was also much activity in the 5 technical divisions and 39 technical committees in advancing developments in the field of electrical engineering. Membership in 1952 was 45,000. Publications: *Electrical Engineering*, monthly; *Transactions*, annually; *Standards* and special publications, published irregularly. Officers (1952): Donald A. Quarles, president; H. H. Henline, secretary. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Institute of Mining and Metallurgical Engineers.—This society was founded in 1871 to promote the arts and sciences connected with the economic production of minerals and metals and the welfare of the individuals employed in these industries. The regular annual meeting was held in New York, N.Y., Feb. 18-21, 1952. In 1952 there were 17,221 members and 2,341 student associates. Publications: *Mining Engineering*, *Journal of Metals* and *Journal of Petroleum Technology*, all monthly. The institute's endowments total \$935,000. Officers (1952) included Michael L. Haider, president, and Edward H. Robie, secretary. Headquarters: 29 W. 39th St., New York 18, N.Y.

American Iron and Steel Institute.—In 1908 this organization was founded to promote the interests of the iron and steel industry, distribute information and promote discussion of problems relating to the industry. During 1952 committees held about 300 meetings at which total attendance was more than 4,500. Its 1952 membership included 2,403 active, associate, honorary and emeritus members, and 94 company members. Publications: *Steelways*, bimonthly; *Steel Facts*, bimonthly; and numerous booklets and pamphlets. Officers (1952) included Max D. Howell, executive director and treasurer; George S. Rose, secretary. Headquarters: 350 Fifth Ave., New York 1, N.Y.

American Law Institute.—Founded Feb. 23, 1923, this organization is designed to promote the clarification and simplification of the law and its better adaptation to social needs. In 1952 the institute published the official draft of the Uniform Commercial Code and sponsored numerous courses and lectures and the distribution of literature on selected phases of the law. Work continued in 1952 on the drafting of a federal income tax statute and a five-year project to draft a code of substantive criminal law was begun. In 1952 there were 1,176 elected members. Officers (1952) included Harrison Tweed, president; Herbert F. Goodrich, director and secretary; Earl G. Harrison, treasurer. Headquarters: 133 S. 36th St., Philadelphia 4, Pa.

American Mathematical Society.—Established in 1888 to further the interests of mathematical scholarship and research, the society held 12 meetings during 1952. Publications: *Bulletin of the American Mathematical Society*; *Proceedings of the American Mathematical Society*; *Transactions of the American Mathematical Society*; and *Proceedings of the International Congress of Mathematicians*. Membership in 1952 was 4,453. Officers (1952): John von Neumann, president; E. G. Begle, secretary. Headquarters: 80 Waterman St., Providence 6, R.I.

American Medical Association.—This federation of constituent state and territorial medical associations was founded in 1847 to promote the science and art of medicine and the betterment of public health. Activities during 1952 included the evaluation of new drugs, foods, physical medi-

cine devices and techniques, cosmetics and pesticides. In 1952 members contributed more than \$500,000 to aid medical schools. Publications: *The Journal of the American Medical Association*; *American Medical Directory*; *Today's Health*, a monthly magazine; and several special publications. Membership in 1952 was approximately 140,000. Officers (1952): Louis H. Bauer, Hempstead, N.Y., president; Edward J. McCormick, Toledo, O., president-elect; George F. Lull, Chicago, Ill., secretary and general manager. Headquarters: 535 N. Dearborn St., Chicago 10, Ill.

American Optometric Association.—Founded in 1897, this organization's purpose is to promote the visual welfare of America and serve the professional interests of optometrists. During 1952 it presented a new visual recognition chart developed after five years of research. Seminars met in Cleveland, O., and Chicago, Ill.; the annual Congress of Optometry was held in Miami Beach, Fla., with the theme of children's vision. Membership in 1952 totalled 11,000. Publications: *Journal of the American Optometric Association*, published monthly, *Visual Digest* and booklets on highway vision and optometry as a vocation. Officers (1952): James F. Wahl, president; Leo G. Miller, treasurer; Ernest H. Kiekenapp, secretary. Headquarters: Jenkins building, Pittsburgh 22, Pa.

American Prison Association.—Founded in 1870 and incorporated in 1871, this association works for the improvement of laws governing public offenders, studies the causes of crime and the nature of offenders and their social surroundings, works for the improvement of penal institutions, and is concerned with the care of and provision of jobs for former prisoners. In 1952 the association sponsored the 82nd annual congress of correction. Membership in 1952 was about 2,000 consisting of court, crime-enforcement and penal officials and citizens interested in crime problems. Publications: *Prison World* (bimonthly); *Handbook on Classification*; *Manual of Suggested Standards for a State Correctional System*; and others. Officers (1952): James W. Curran, president; E. R. Cass, general secretary; John L. Schoenfeld, treasurer. Headquarters: 135 E. 15th St., New York 3, N.Y.

American Society of Civil Engineers.—Commemorating its founding in 1852 as the first national engineering group, the society sponsored its centennial in Chicago during Sept. 1952. This celebration featured more than 200 sessions arranged by 65 engineering organizations and attended by thousands of U.S. and foreign engineers. In 1952 the society membership was about 35,000. Organized for the purpose of advancing the sciences of engineering and architecture, the society directs professional activities from its headquarters in New York city, through 73 local sections and student chapters in 133 engineering colleges; also the 13 following technical divisions: air transport, city planning, construction, engineering mechanics, highways, hydraulics, irrigation and drainage, power, sanitary engineering, soil mechanics and foundations, structural, surveying and mapping, and waterways. Publications: *Proceedings-Separates* (several pamphlets each month); *Transactions*, yearly; *Civil Engineering*, monthly; a *Directory* (membership list), and a *Register* (organization details). Officers (1952): Carlton S. Proctor, president; (1953) Walter L. Huber, president; William N. Carey, executive secretary. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Society of Composers, Authors and Publishers (ASCAP).—Founded in 1914, the society, a voluntary nonprofit unincorporated association, collects performing right royalties for allocation to members whose copyrighted musical works are used in public performances for profit. Its membership in 1952 totalled 3,100. Officers (1952) included Otto A. Harbach, president; Frank H. Connor and Oscar Hammerstein II, vice-presidents; Paul Cunningham, secretary; Louis Bernstein, treasurer. Headquarters: 575 Madison Ave., New York 22, N.Y.

American Society of Mechanical Engineers.—This organization was founded in 1881 to promote the art and science of mechanical engineering, to encourage original research, to foster engineering education, to advance the standards of engineering and to promote interchange of ideas among engineers themselves. In 1952 the society held four national meetings and six professional division conferences. In addition, meetings were held by the 77 local sections, 6 subsections and the 134 student branches. Membership totalled 37,887 in 1952. Publications: *Mechanical Engineering* and *Applied Mechanics Reviews*, both monthly; *Journal of Applied Mechanics*, quarterly; *ASME Mechanical Catalog and Directory*, annual. Officers (1952): R. J. S. Pigott, president; Clarence E. Davies, secretary; J. L. Kopf, treasurer. Headquarters: 29 W. 39th St., New York 18, N.Y.

American Sunday-School Union.—The purpose of this organization, founded in 1817 as the Sunday and Adult School union, is "to organize and maintain Sunday schools in the rural areas of the United States and to publish and circulate Christian literature." During 1952, 1,576 vacation Bible schools were held with an enrolment of 46,418. More than 2,400 rural Sunday schools enrolled 93,404, and 99 Young People's Bible conferences were attended by more than 7,000 rural youths. A new group, Pioneers for Christ, was organized for rural boys and girls of high school age. Publications included a full line of Sunday-school periodicals. The work is supported largely by contributions and a small endowment. Officers (1952): Belding B. Slifer, president; Elliott D. Parkhill, secretary of missions; William J. Jones, editor of publications. Headquarters: 1816 Chestnut St., Philadelphia, Pa.

Boy Scouts of America.—This nation-wide youth organization with activities for boys of eight years and older was organized in 1910 and chartered by congress in 1916. Objectives are to teach patriotism and citizenship and the importance of religion in daily life. In 1952 Boy Scout week, celebrating the 42nd anniversary of the group, was observed nationally, Feb. 6-12. A three-year program was launched with the slogan, "Forward on Liberty's Team." Civic activities included a "Get Out the Vote" campaign in November. Membership, 1952, was 2,996,267. The world scout membership as of 1949 was 4,416,306 in 46 countries. Headquarters: 2 Park Ave., New York 16, N.Y.

Brookings Institution.—A nonprofit organization dedicated to public service through research and education in economics and government, the institution was founded in 1928 and is supported by income from its own endowment, grants from foundations and the sale of publications. During 1952 the following studies were published: *Share Ownership in the United States*, by Lewis H. Kimmel; *Health Resources of the United States*, by George W. Bachman and associates; and *Major Problems of*

United States Foreign Policy. Officers (1952): Robert D. Calkins, president; Elizabeth H. Wilson, secretary. Headquarters: 722 Jackson Place N.W., Washington 6, D.C.

Buhl Foundation.—Established in 1927, the Buhl foundation had by 1952 granted to existing (or especially established) agencies a total of \$7,545,230 for the promotion of nationally significant programs in the Pittsburgh, Pa., district. These programs were in regional economics, historical and social research, in higher education and in research in natural sciences. The foundation's \$1,700,000 Chatham Village, pioneering demonstration of large-scale planned residential community built for long-term investment, had received international recognition. The \$1,100,000 Buhl planetarium, built and maintained as a memorial to the founder, had conducted a program of popular science education from elementary school to adult level since 1939. Foundation assets in 1952 were \$13,351,679. Director: Charles F. Lewis. Headquarters: Farmers Bank building, Pittsburgh 22, Pa.

Camp Fire Girls, Inc.—This youth organization, founded in 1910, aims "to perpetuate the spiritual ideals of the home" and "to stimulate and aid in the formation of habits making for health and character." In 1952 Camp Fire Girls observed Birthday week (theme: "Design for Friendship"), March 16–22, and conducted a membership drive, Sept. 15 through Nov. 30. Activities also included participation in a project to send dolls to war orphans in Europe. In 1952 more than 370,000 girls were reported enrolled in its three groups: Blue Birds, 7 to 9 years old; Camp Fire Girls, 10 to 15 years old; and Horizon club members, of senior high school age. Publications: *Book of the Camp Fire Girls*; *The Camp Fire Girl* (monthly); and others. National officers (1952): Mrs. Richard W. Blalock, president; George W. Hearn, chairman of the board; Mrs. R. L. Heminger, secretary; Martha F. Allen, national director. Headquarters: 16 E. 48th St., New York 17, N.Y.

Carnegie Trusts.—Six autonomous and separately administered agencies in the U.S. were established by Andrew Carnegie for various philanthropic purposes; in addition, there are four Carnegie trusts in Great Britain, and Carnegie Hero funds operate in nine European countries.

Carnegie Corporation of New York (1911), with a basic endowment of \$135,000,000, had in 1952 assets of more than \$175,000,000; the income from \$12,000,000 of this is applicable in the British dominions and colonies. Its purpose is the advancement and diffusion of knowledge and understanding among the people of the U.S. and the British dominions and colonies. Grants are awarded to institutions of higher education and organizations engaged in research and public education. The primary interest is in the advancement of the social sciences and in the improvement of teaching. President (1952) Charles Dollard; secretary, Robert M. Lester. Headquarters: 522 Fifth Ave., New York 36, N.Y.

Carnegie Institute of Pittsburgh (1896) includes a department of fine arts, a music hall and a museum of natural history, and to it are closely related the Carnegie Library of Pittsburgh, the Carnegie Library school and the Carnegie Institute of Technology. President (1952), James M. Bovard; secretary, Augustus K. Oliver. Headquarters: 4400 Forbes St., Pittsburgh 13, Pa.

Carnegie Institution of Washington (1902), with assets exceeding \$48,000,000 in 1952, conducts fundamental scientific investigation, particularly in astronomy, terrestrial magnetism, geophysics, archaeology, plant biology, embryology, genetics and historical research. President (1952), Vannevar Bush; executive officer, Paul A. Scherer. Headquarters: 1530 P St. N.W., Washington 5, D.C.

Carnegie Hero Fund Commission (1904), with assets in 1952 of approximately \$10,000,000, was established to recognize by medals and monetary awards heroic acts performed in the peaceful walks of life. President (1952), Thomas S. Arbuthnot; manager, M. H. Floto. Headquarters: Oliver building, Pittsburgh 22, Pa.

Carnegie Foundation for the Advancement of Teaching (1905) was established to provide retiring pensions for teachers and to advance higher education. In addition to an original grant from Carnegie, by 1952 it had received sums amounting to more than \$32,000,000 from the Carnegie corporation. President (1952), Oliver C. Carmichael; secretary, Robert M. Lester. Headquarters: 522 Fifth Ave., New York 36, N.Y.

Carnegie Endowment for International Peace (1910) uses the income from its \$10,000,000 endowment to further friendly understanding among nations, its aim in 1952 being to study problems of international organization and contemporary world politics. President (1952), Joseph E. Johnson; secretary, Leslie Paffrath. Headquarters: 405 W. 117th St., New York 27, N.Y.

Catholic Community Service, National.—This service organization was founded on Nov. 13, 1940, as the agency designated by the Catholic bishops of the U.S. to mobilize and co-ordinate the Catholic resources of the country to assist in serving the spiritual, educational, recreational and welfare needs of the men and women in the armed forces, their families, patients in Veterans administration hospitals and individuals and their families in defense impacted communities. During 1952 the service conducted volunteer work in 158 hospitals and also conducted programs in 62 activities near major military establishments in the U.S. and overseas. Publications: *NCCS News*; several religious pamphlets; and *Greetings!*, a pamphlet for young men about to be inducted into the armed forces. Thomas D. Hinton was executive director in 1952. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Catholic Library Association.—Founded in 1921 as a section of the National Catholic Educational association, it became an independent organization in 1929. Its purpose is to initiate and encourage any movement that will promote Catholic literature and Catholic library work. In February 1952 Catholic Book week was celebrated in conjunction with the Catholic Press Month convention in New York city. Membership in 1952 was about 1,900. Publications: *Catholic Supplement to the Standard Catalog for High School Libraries*; *Catholic Periodical Index*; *Catholic Booklist*; and *Catholic Library World*. Officers (1952): John M. O'Loughlin, president; Helen L. Butler, president-elect; Mrs. Jeannette Murphy Lynn, executive secretary. National headquarters address: 209 Vine Ave., Park Ridge, Ill.

Catholic Organizations for Youth.—The central co-ordinating agency of this organization, organized on diocesan and national levels, is the youth department of the National Catholic Welfare conference. The purpose of

the Catholic youth organizations is the fostering of the spiritual welfare of young people through religious, cultural, social and athletic activities. Organizations connected with the diocesan section by affiliation are the Columbian Squires, the Junior Catholic Daughters of America, the Young Christian Workers, the Daughters of Isabella and the Sodality of Our Lady. In 1951 the diocesan section was raised to the national level by the formation of the National Federation of Diocesan Catholic Youth councils; this organization, the National Federation of Catholic College Students and the National Newman Club federation formed the National Council of Catholic Youth. The total number of young persons reached by the various programs was estimated in 1952 at about 7,000,000. In 1952 a new magazine called *Vision* was established, and National Catholic Youth week was celebrated Oct. 19–26. Diocesan groups and college federations have individual publications, and the youth department of the N.C.W.C. publishes *Newsnotes*, a monthly with material of interest to diocesan youth directors; *Program Service*, for parish youth directors; a *Catholic Youth Directory*; and pamphlets. Msgr. Joseph E. Schieder was N.C.W.C. youth department director in 1952. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Catholic Rural Life Conference, National.—This organization was founded in 1923 to care for underprivileged Catholics in farming areas and to encourage Catholics to settle and remain on the land. During 1952 it urged individual responsibility for flood control and reaffirmed its support of the family-farm principle. Publication: *The Christian Farmer*. Membership in 1952 was 10,000. Officers (1952): Albert R. Zuroweste, Bishop of Belleville, president; Msgr. L. G. Ligutti, executive director. Headquarters: 3801 Grand Ave., Des Moines 12, Ia.

Catholic Welfare Conference, National.—This organization was founded in 1919 to organize and co-ordinate the Catholic residents of the U.S. in works of education, social welfare, immigrant aid and other activities. During 6 months of 1952 War Relief Service distributed 29,139,438 lb. of relief material valued at \$12,740,639. The National Council of Catholic Men began a Film Information service and presented a television series on the sacraments. Publications: *Catholic Action* and *Vision*, a monthly magazine in the field of Catholic youth. Officers (1952): Archbishop Francis P. Keough, Baltimore, Md., chairman; Bishop John F. Noll, Fort Wayne, Ind., secretary. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Chamber of Commerce of the United States.—A federation of businessmen's organizations founded in 1912, the chamber was organized "to promote a better understanding of the functions of American business enterprise and of the contribution of business to public well-being and to serve as a clearinghouse of business opinion on economic issues."

In 1952 the national chamber's program emphasized six issues: building a better public understanding of basic economic issues and the American profit and loss system; creating a demand for government economy and efficiency; helping develop an equitable tax system; promoting voluntary welfare developments; establishing a fair basis for labour-management relations with a minimum of government intervention in collective bargaining; and supporting foreign policy which would protect national security and safeguard the citizen's home, individual rights and business.

In 1952 there were 3,315 organization members (state and local chambers of commerce and trade and industrial organizations) and 23,000 business members (firms, corporations and individual businessmen).

Publications: *Washington Report* (weekly); *Nation's Business* (monthly); *Legislative Daily*; *Bill Digest*; *American Economic Security*, published eight times a year; newsletters; and special reports, papers, studies, etc. Officers (1952): Laurence F. Lee, president; D. A. Hulcy, chairman of the board of directors; Otto A. Seyferth, chairman of the executive committee. Headquarters: 1615 H St. N.W., Washington 6, D.C.

Charles Hayden Foundation.—This organization was established in 1937 under the will of Charles Hayden to assist young men to "receive proper training in boyhood and youth . . . in the manner of right and proper living." Its activities are devoted mainly to aiding boys' clubs, boys' camps and similar projects for underprivileged boys, especially those of the New York, N.Y., and Boston, Mass., areas. By Sept. 30, 1952, the foundation had contributed \$22,092,636 for these purposes, and there was approximately \$52,292,865 in the fund. Officers: J. Willard Hayden, president; Edgar A. Doubleday, executive vice-president and treasurer; Erle V. Daveler, vice-president. Headquarters: 25 Broad St., New York 4, N.Y.

Commonwealth Fund.—Established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and increased by other bequests, the fund amounted to approximately \$85,000,000 at the end of the fiscal year 1951–52. Appropriations for that year were \$2,719,737. The major concern of the fund in 1952 was helping medical schools to reorient medical education to the student and medical care to the patient, by better integration and increased attention to the relation between the patient and his environment. Grants for medical education amounted to \$1,217,554; for experimental health services \$433,068; and for medical research \$413,569. In the academic year 1952–53, 37 men and 1 woman held Commonwealth fund British fellowships for students and civil servants from Great Britain and other parts of the British Commonwealth. Nine new fellowships were held by Europeans who attended the Salzburg Seminar in American Studies. The fund publishes an annual report. Malcolm P. Aldrich was president in 1952. Headquarters: 1 E. 75th St., New York 21, N.Y.

Daughters of the American Revolution.—The National Society of the Daughters of the American Revolution was founded in 1890 for historical, patriotic and educational purposes. The society in 1952 had 171,021 members in 2,699 chapters. During the year it operated two schools and provided financial assistance to others; conducted programs for good citizenship; operated 11,823 Junior American Citizens clubs with 356,589 members; maintained a genealogical library; and conducted various educational programs of a patriotic nature. Publications: *Daughters of the American Revolution Magazine*; *D.A.R. Manual for Citizenship*; and *Press Relations Digest*. Mrs. James B. Patton was president general in 1952. Headquarters: 1776 D St. N.W., Washington 6, D.C.

Duke Endowment.—By an indenture executed Dec. 11, 1924, by James B. Duke, the Duke endowment was established as a common-law trust "to make provision in some measure for the needs of mankind along physical,

mental and spiritual lines." The fund allocates payments to educational institutions, including Duke university, Durham, N.C., and also distributes funds to help support hospitals, orphanages and the Methodist Church in rural areas. The amount distributed from Dec. 11, 1924, to Dec. 31, 1951, was \$96,077,322.79. The fund is supervised by a self-perpetuating board of 15 trustees. Officers (1952) included George G. Allen, chairman; Alex H. Sands, Jr., secretary; Walter C. Parker, treasurer. Headquarters: Power building, Charlotte 1, N.C.

Elks, Benevolent and Protective Order of.—Founded in 1868, this service organization in 1952 had 1,080,000 members in 1,615 lodges. Its purpose is to practise charity, justice, brotherly love and fidelity; promote the welfare and enhance the happiness of its members; quicken the spirit of American patriotism and cultivate good fellowship. In 1952 charitable expenditures totalled almost \$6,000,000. The order supported the government's blood-bank program and also provided financial aid to people studying in cerebral palsy treatment centres, to crippled children and to tubercular patients. Publication: *The Elks Magazine*. Officers (1952): Sam Stern, Fargo, N.D., grand exalted ruler; J. E. Masters, grand secretary; 12750 Lakeview Ave., Chicago 14, Ill., the national headquarters.

Falk Foundation, Maurice and Laura.—This foundation was established in 1929 with the broad purpose of the advancement of human welfare. Activities of 1952 included grants to economic research organizations for studies of problems concerning the operation and development of the domestic economy of the U.S. and grants for studies and projects to promote the efforts of colleges and universities to prepare their students for the political responsibilities of U.S. citizenship. Publications: *Preparing College Men and Women for Politics and Health Resources in the United States*. Funds as of June 13, 1952, were \$10,408,113.13. Officers (1952): Leon Falk, Jr., chairman; Eugene B. Strassburger, secretary; J. Steele Gow, executive director. Headquarters: 1911 Farmers Bank building, Pittsburgh 22, Pa.

Ford Foundation.—Founded on June 15, 1936, the Ford foundation devotes its resources "to programs for the advancement of peace, education, the behavioral sciences, democratic institutions and economic stability." During the year ended Dec. 31, 1951, it approved grants totalling \$22,331,736, of which more than \$10,000,000 was allocated through the Fund for the Advancement of Education and the Fund for Adult Education, and \$6,550,000 was for work in India, Pakistan and the middle east. The total assets of the foundation as of Jan. 1, 1951, amounted to \$492,678,255. Officers (1952) included Henry Ford II, chairman; Paul G. Hoffman, president; Oliver May, secretary and treasurer. Offices: 914 East Green St., Pasadena, Calif.; 655 Madison Ave., New York, N.Y.; Buhl building, Detroit, Mich.

Franklin Institute of the State of Pennsylvania.—This nonprofit institution was founded in 1824 for promotion of the mechanic arts. It devotes itself to interpreting science for nontechnical persons and to research for the benefit of industry and government. Activities include maintenance of the Benjamin Franklin memorial, a museum of science and industry, including Fels planetarium; a technical library of more than 139,000 volumes, 50,000 pamphlets and 6,900 maps; lectures and exhibits on a wide variety of subjects; honour awards for distinguished achievements in science and technology; publication of the *Journal of the Franklin Institute*; the Franklin Institute Laboratories for Research and Development; the Bartol Research foundation; and the Biochemical Research foundation. In 1952 the second annual meeting of the National Asphalt Research centre was held. Income is derived from dues of approximately 6,000 members, museum and planetarium admissions, bequests and gifts and industrial sponsorship of research and exhibits. Officers (1952): S. Wyman Rolph, president; Henry B. Allen, executive vice-president and secretary. Headquarters: Benjamin Franklin Parkway at 20th St., Philadelphia 3, Pa.

Freemasonry.—Said to be the oldest and largest fraternal organization in the world, the Masonic fraternity is nonsectarian, nonpolitical and has no benefit or insurance provisions. Its purpose is the moral and spiritual elevation of its members and, through them, of mankind. Since the 18th century its lodges have been joined together in grand lodges, mostly on a territorial basis, each grand lodge being independent. Masonic organizations based on lodge membership include the Royal Arch, the Knights Templar and the Scottish Rite. In 1952 the bicentennial of the initiation of George Washington into the mysteries of Freemasonry was observed. During the year dispensations were granted to two new research lodges, both in California. Masonic membership in the U.S. in 1952 was 3,731,689 in 15,437 lodges; world membership was in excess of 5,000,000. Publications: annual transactions by all grand lodges and many of the related organizations.

Future Farmers of America.—Founded Nov. 20, 1928, this is a national organization of boys studying vocational agriculture in public secondary schools under the provisions of the national vocational education acts. The chief of the agricultural education service of the U.S. office of education is chairman of an adult national advisory council. The purpose of the Future Farmers is to develop agricultural leadership, co-operation and citizenship. Membership as of June 30, 1952, was 352,916. Publications: *National Future Farmer*, quarterly, and various pamphlets. Officers (1952) included Donald Staheli, national president and Charles Ocker, student secretary. Headquarters: U.S. Office of Education, Federal Security Agency, Washington 25, D.C.

Georgia Warm Springs Foundation.—This nonprofit organization, founded on July 28, 1927, treats aftereffects of poliomyelitis at the hospital and facilities at Warm Springs, Ga. It has no endowment, its annual deficit being financed by appropriations from the National Foundation for Infantile Paralysis. Publications include annual reports and medical articles of the professional staff. Officers (1952): Basil O'Connor, president and treasurer; Henry K. Urien, executive vice-president and counsel; William F. Snyder, vice-president and secretary. Headquarters: 120 Broadway, New York 5, N.Y.

Girl Scouts of the United States of America.—The purpose of this organization, founded in 1912 by Juliette Low, "is to help girls realize the ideals of womanhood as a preparation for their responsibilities in the

home and as active citizens in the community and in the world." Activities in 1952 included participation in the 14th biennial world conference of the Girl Guides and Girl Scouts at Dombas, Nor., Aug. 2-14. On election day in Nov. 1952, the Girl Scouts helped mothers get to the polls by caring for their children and homes. On June 30, 1952, 1,890,000 girls and adults were members. Publications: *Girl Scout Leader*; *American Girl*; and *Girl Scout Handbook*. Officers (1952): Dorothy C. Stratton, national executive director; Mrs. Roy F. Layton, president; Mrs. Charles H. Ridder, secretary. Headquarters: 155 E. 44th St., New York 17, N.Y.

International College of Surgeons.—This organization was founded in Geneva, Switz., in 1935 to create a common bond among surgeons of all nations and promote high standards in surgery. In 1952 an international assembly was held in Madrid, Sp., May 19-24; postgraduate courses were given in Argentina, Brazil, Germany, Austria and the U.S. Membership was about 9,000. Its publication is *The Journal of the International College of Surgeons*. Officers (1952): Hans Finsterer (Austria), president; Max Thorek, secretary general. Headquarters: 1516 Lake Shore Dr., Chicago 10, Ill.

Jewish Welfare Board, National.—Founded in 1917, this agency is authorized by the U.S. government to serve the religious, welfare and morale needs of Jews in the U.S. armed forces at home and abroad and in Veterans administration hospitals. In 1952 it had 285 community armed services committees. It recruited and served 85 full-time and 220 part-time Jewish chaplains, and represented the U.S. Jewish community in the United Service organizations, on whose behalf it operated 35 clubs and area operations. Since 1921 it had also been the national association of Jewish Community centres and Young Men's and Young Women's Hebrew associations. Its 1952 membership included 343 centres with 510,000 members and 40 national affiliated organizations. Officers (1952): Irving Edison, president; S. D. Gershovitz, executive vice-president. Headquarters: 145 E. 32nd St., New York 16, N.Y.

John Simon Guggenheim Memorial Foundation.—Founded in 1925, the foundation "offers Fellowships, to further the development of scholars and artists by assisting them to engage in research in any field of knowledge and artistic creation in any of the fine arts including music, under the freest possible conditions." The organization during 1952 awarded 149 fellowships to citizens of the U.S., 9 to Canadians and 30 to citizens of the Latin American republics and the Republic of the Philippines. Endowment: \$30,000,000. Officers (1952): Mrs. Simon Guggenheim, president; Henry Allen Moe, secretary. Headquarters: 551 Fifth Ave., New York 17, N.Y.

Kellogg Foundation.—The W. K. Kellogg foundation was established in 1930 to promote the health, education and welfare of mankind, principally of children and youth without regard to race, sex, creed or nationality. It functions through the divisions of dentistry, education, medicine and public health, hospitals, nursing and the international division. It is administered by a board of trustees, and its assets totalled \$67,971,407 in 1952. Officers (1952): Emory W. Morris, president; Glenn A. Cross, vice-president; Bessie Rogers Young, secretary and treasurer. Headquarters: 250 Champion St., Battle Creek, Mich.

Kiwanis International.—Founded Jan. 21, 1915, in Detroit, Mich., this service organization operates through community Kiwanis clubs, comprised of business and professional men. It celebrated the fourth annual National Kids' day, Sept. 27, 1952, and members again raised more than \$500,000 to continue youth programs. Clubs provided lunches and milk for 559,657 needy children, sponsored 2,743 activities promoting economy in government and raised \$10,812,822.14 for public welfare campaigns. Membership in 1952 included more than 215,000 in 3,500 clubs of the U.S., Canada, Alaska, Hawaii and the Yukon territory. Publications: *Kiwanis Magazine*, *Monthly Club Bulletin* and *The Keynote*, organ of the Kiwanis-sponsored Key clubs for outstanding high school youths. Officers, 1952-53: Walter J. L. Ray, president; O. E. Peterson, secretary; Donald T. Forsythe, treasurer. Headquarters: 520 N. Michigan Ave., Chicago 11, Ill.

Knights of Columbus.—This Roman Catholic men's organization was founded in 1882 for the mutual help of its members and to conduct educational, charitable, religious, social and relief work. In 1952 it was reported that 94,723 persons had been enrolled for Catholic instruction by mail. The advertising budget was increased from \$500,000 to \$750,000 for 1953. Its membership in 1952 was 829,634. Publication: *Columbia*, a monthly. John E. Swift was supreme knight. Headquarters: 45 Wall St., New Haven 7, Conn.

League of Women Voters of the United States.—Founded Feb. 14, 1920, to promote informed and active participation of citizens in government, the membership in 1952 was 106,000 in 848 leagues in 47 states. In 1952 the league held discussions and published material on measures concerning world security and the improvement of congressional budgetary procedures. League services included demonstrating voting machines, campaigning to have people register and vote and watching polls. Publications: *On the Record*, a report of roll call votes; *BIG Government and Conservation*; *The Citizen and International Trade*; and *Congressional Strings on the Public Purse*. Officers (1952): Mrs. John G. Lee, president; Mrs. Walter Neale, secretary; Mrs. F. W. Hopkins, treasurer. Headquarters: 1026 17th St. N.W., Washington 6, D.C.

Lions Clubs, International Association of.—The purpose of this organization, founded in 1917, is "to recognize community needs and develop means of meeting them, either through the clubs' own efforts or in co-operation with other agencies." In 1952 the international convention was held June 25-28 in Mexico City, Mex. Lions clubs were established in six additional countries, making a total of 37 countries. A seven-story building in Chicago, Ill., was purchased for use as headquarters. Membership in 1952 was 455,000. Publication: *The Lion*, monthly. Officers (1952) included Edgar M. Elbert, Maywood, Ill., president; R. Roy Keaton, Chicago, Ill., director general. Headquarters: 332 S. Michigan Ave., Chicago 4, Ill.

Milbank Memorial Fund.—A membership corporation under the laws of the state of New York, this organization was founded April 3, 1905, to

improve the physical, mental and moral condition of humanity and generally to advance charitable and benevolent objects. In 1950 the fund appropriated \$478,281 to support activities and projects in its field of interest, including \$289,800 for grants and fellowships to outside agencies. Total funds (Dec. 31, 1952) amounted to \$11,678,705. Publication: *Milbank Memorial fund Quarterly*. Officers (1952): Samuel R. Milbank, president; Frank G. Boudreau, executive director. Headquarters: 40 Wall St., New York 5, N.Y.

Music Library Association.—Founded in 1931, this association seeks to promote the establishment and growth of music libraries and collections in the U.S. In 1952 its membership was 900. The association met with the American Library association in New York, N.Y., June 30–July 1, 1952. Publications: *Notes and Supplement*, both quarterly, and *Cumulated Index of Record Reviews* (2 vol.). Officers (1952) included Harold Spivacke, president; George R. Henderson, secretary. Headquarters: Music Division, Library of Congress, Washington 25, D.C.

National Academy of Sciences.—Founded in 1863, by act of congress, the academy's purpose is to advise the government on any subject of science or technology; stimulate research in science and its application to national welfare; and promote co-operation in research in the U.S. and internationally. During 1952 it administered research fellowships supported by philanthropic foundations and industry, advised government departments and maintained a large number of committees of civilian scientists for joint study of specific problems. Membership in 1952 was 558; there were 225 members of the National Research Council (founded 1916) and about 3,000 members of committees. Publications: *Proceedings of the National Academy of Sciences*; *News Report*; periodicals; numbered series of technical publications reviewing research. It is endowed by the Carnegie Corporation of New York. Detlev W. Bronk was president of the academy in 1952, and William W. Rubey was chairman of the National Research Council. Headquarters: 2101 Constitution Ave. N.W., Washington 25, D.C.

National Association for the Advancement of Colored People.—Founded in 1909, this organization directed its 1952 activities chiefly toward increasing registration and voting among Negro citizens and toward abolishing segregation in public schools. Membership in 1952 was approximately 250,000. Publication: *Crisis* magazine. Officers (1952): Arthur B. Spingarn, president; Walter White, executive secretary. Headquarters: 20 W. 40th St., New York 18, N.Y.

National Association of Manufacturers.—The N.A.M. was founded in 1895 to promote the industrial interests of the U.S., foster domestic and foreign commerce, improve employer-employee relations, protect individual liberty and the rights of employer and employee and support legislation in furtherance of those principles. Its activities in 1952 were exercised through 13 committees. Membership in 1952 was approximately 17,700. Publications: *The Magazine of American Affairs* (monthly); *The Washington Bulletin* (weekly); *Annual Report*; *NAM Law Digest* (quarterly); and others. Officers (1952) included: William J. Grede, president; Earl Bunting, managing director; Noel Sargent, secretary. Headquarters: 14 W. 49th St., New York 20, N.Y.

National Association of State Libraries.—This association was founded in 1889 "to provide active co-operation among state libraries and to facilitate the exchange of state laws, court reports and public documents." Its 1951 membership included 46 state libraries. Its national convention was held in New York city in July 1952. Publications include check lists of collected public documents, legislative journals, session laws and statutes. Officers (1952): Grace Sherwood, Rhode Island State library, president; Helene Rogers, Springfield, Ill., secretary-treasurer. Headquarters: Springfield, Ill.

National Education Association of the United States.—This organization was founded in 1857 "to elevate the character and advance the interests of the teaching profession and to promote the cause of education throuth the country." At its 1952 convention in Detroit, Mich., the association adopted a revised code of ethics and approved a proposal to establish a National Council on Accreditation of Teacher Education. As of May 31, 1952, the membership was 490,968; membership of affiliated state associations was 953,115. Publications include *NEA Journal and Research Bulletin*. Officers (1952–53): Sarah C. Caldwell, president; William G. Carr, executive secretary. Headquarters: 1201 16th St. N.W., Washington 6, D.C.

National Science Foundation.—The National Science foundation is an independent agency of the federal government, established by congress in May 1950 "to promote the progress of science; to advance the national health, prosperity, and welfare; to secure the national defense; and for other purposes." The foundation consists of the National Science board and a director. Its principal activities are the development of national science policy; the support of basic research in the mathematical, physical, medical, biological, engineering and other sciences; and the furtherance of education in the sciences through the award of graduate fellowships and by other means. Chester I. Barnard was chairman of the board in 1952 and Alan T. Waterman was director.

During 1952 the foundation awarded 96 grants, or a total of \$1,070,975, in the biological, mathematical, medical, physical and engineering sciences at 59 institutions in 33 states, the District of Columbia and Hawaii. Nearly 75% of the awards made by the foundation went to institutions that had had the least support from other federal research programs. In April 1952, 624 graduate fellowships were awarded for the academic year 1952–53. There were 569 predoctoral awards and 55 postdoctoral awards. The foundation provided financial assistance to 23 U.S. scientists to enable them to attend scientific meetings abroad. Headquarters: 2144 California St., N.W., Washington, D.C.

National Temperance League, Inc.—This federation of state temperance organizations was formed by the merger in 1950 of the Temperance League of America (formerly the Anti-Saloon League of America) and the National Temperance Movement, Inc. Its purpose is to promote abstinence and to diminish and ultimately eliminate the traffic in alcoholic beverages. The official publication is the *American Issue*. Officers (1952) included:

president, Duke K. McCall; secretary, James R. Swedenburg. Headquarters: 131 Independence Ave. S.E., Washington 3, D.C.

Parents and Teachers, National Congress of.—This organization, founded in 1897 as the National Congress of Mothers, had in 1952 a membership of 7,219,165 parents, teachers and other citizens organized in about 38,000 local associations. Its purpose is to promote the welfare of children; raise the standards of home life; secure laws for care and protection of children and youth; bring the home and school into closer relationship; and develop plans for joint action along these lines by educators and the general public. Activities in 1952 included participation in joint meetings with the American Association of School Administrators and other organizations and completion of a study course series for parents, "Building Healthy Personalities," in the *National Parent Teacher: The P.T.A. Magazine*. Other publications include the *National Congress Bulletin*; *Proceedings*, published annually; and *A Reading Guide for Parents*. Officers (1952): Mrs. Newton P. Leonard, national president; Mrs. Russell C. Bickel, national secretary. National headquarters: 600 S. Michigan Blvd., Chicago 5, Ill.

Research Libraries, Association of.—Founded in 1931, this association of 45 institutions seeks by co-operative effort to develop and increase the resources and usefulness of the research collections in American libraries. In 1952 it was active in extending the Farmington plan to procure research materials from abroad for U.S. libraries, and in relaxing restrictions on the use of manuscript material and the interlibrary loan of microfilm. Publications include *Doctoral Dissertations Accepted by American Universities*. R. A. Miller was executive secretary in 1952, and headquarters were at the Indiana University Library, Bloomington, Ind.

Rockefeller Foundation.—Founded in 1913 "to promote the well-being of mankind throughout the world," the foundation during 1952 made grants to institutions or agencies such as universities, research institutes or governmental agencies. Its program for the advancement and application of knowledge to human interest was concentrated in certain specific fields of the natural sciences and agriculture, social sciences, humanities and public health. The 21 trustees are the 21 members of the corporation. Assets, Dec. 31, 1951, totalled \$139,495,406. Officers (1952): Dean Rusk, president (from July 1, 1952); Edward Robinson, treasurer; Flora M. Rhind, secretary. Headquarters: 49 W. 49th St., New York 20, N.Y.

Rotary International.—Founded Feb. 23, 1905, this organization sponsors a program to encourage and foster the "ideal of service." By 1952, 394 Rotary fellowships for graduate study for one year in foreign countries, ranging from \$1,800 to \$3,400, had been awarded to students from 48 countries. There were 7,600 Rotary clubs with a membership of 362,000 business and professional executives in 83 countries and regions. The 1953 convention was to be held at Paris, Fr., May 24–28. Publications: the *Rotarian* (English) and *Revista Rotaria* (Spanish), monthly magazine; *Proceedings* of 43rd annual convention; and pamphlets. Officers (1952) included: H. J. Brunner, president; Philip Lovejoy, secretary. Headquarters: 35 E. Wacker Dr., Chicago, Ill.

Russell Sage Foundation.—This foundation was established in 1907 by Mrs. Russell Sage for "the improvement of social and living conditions in the U.S." Its 1952 program consisted of varied research and consultation projects, designed to advance the use of the social sciences in the fields of health, education, philanthropy, professions and professional training, the child and the family and intergroup and cultural relations. Publications of 1952 included *Corporation Giving*, by F. Emerson Andrews, and *Social Science and Psychotherapy for Children*, by Otto Pollak. Assets of the foundation, 1951–52, were \$16,260,000. Officers (1952): Eli Whitney Debevoise, president; Donald Young, general director; Dave H. Morris, Jr., treasurer; Ralph G. Hurlin, secretary. Headquarters: 505 Park Ave., New York 22, N.Y.

Seeing Eye, Inc.—A national philanthropy founded in 1929 and supported through annual memberships, public contributions and bequests. The society's purposes include securing and training dogs to guide blind persons, teaching instructors the technique of training the guide dogs and training the blind in the proper use of their guide dogs. During 1952, 180 blind persons were provided with dog guides. Membership was about 20,000; more than 2,000 people had received Seeing Eye dogs since the organization's inception. Publications: *The Seeing Eye Guide*, published quarterly for the members of The Seeing Eye, and printed booklets. Officers (1952): Henry A. Colgate, president; James Carey, treasurer; George Werntz, Jr., secretary. Headquarters: Morristown, N.J.

Sloan Foundation, Inc., Alfred P.—Founded in 1934, the foundation has as its primary purpose the increase and spread of economic knowledge although it also has developed interest in the medical field, particularly in cancer research. Economic activities include grants to research organizations and institutions of higher learning and grants for the production and distribution of television and radio programs, motion pictures, pamphlets and related material in the field of economics. Two of its major grants were one of \$5,602,500 for the establishment of the Sloan-Kettering Institute for Cancer Research of the Memorial Cancer centre in New York city and a grant of \$5,250,000 for the establishment of the School of Industrial Management at the Massachusetts Institute of Technology. In 1952 its funds totalled \$33,836,724. Officers (1952): Alfred P. Sloan, Jr., president; Raymond P. Sloan, vice-president; James F. Kenney, secretary and treasurer; Arnold J. Zurcher, vice-president and executive director. Headquarters: 30 Rockefeller Plaza, New York 20, N.Y.

Sodality of Our Lady.—This international Catholic body was founded in 1563 to foster devotion to Mary, the Mother of God. During 1952 ten weeks of intensive leadership training were given in ten cities of the U.S. A total of 8,883 persons attended. U.S. membership in 1952 comprised 17,169 affiliated units with from 6 to 2,000 members in each. Publications include *The Queen's Work*, *Action Now*, *Junior Sodalist* and books and pamphlets. Officers included a number of priests of the Jesuit order. Headquarters: 3115 S. Grand Blvd., St. Louis 18, Mo.

Twentieth Century Fund.—Founded in 1919 by Edward A. Filene, this is a nonprofit, nonpartisan foundation for research and public education on current economic problems. In 1952 the fund had in the process of pub-

lication studies on the federal debt; world population and production; employment and wages in the U.S.; and farm policies of the U.S., 1790-1950. A sound film on labour-management co-operation entitled *Working Together* was released. Other projects included studies of national and international economic problems such as agricultural policies in the U.S.; antitrust policies and enforcement; urban redevelopment; international monetary policy; U.S. imports; economic, political and social forces influencing the process of industrialization, etc. Total assets, Dec. 31, 1951: \$9,879,497. Officers (1952): A. A. Berle, Jr., chairman of the board; Francis Biddle, chairman, executive committee; Evans Clark, executive director; J. Frederic Dewhurst, economist. Headquarters: 330 W. 42nd St., New York 36, N.Y.

United States Junior Chamber of Commerce.—The purpose of this organization, founded in Oct. 1915, is to help make every community (and the country) a better place in which to live through the promotion of constructive civic projects, and to help develop civic leadership. In 1952 the chamber sponsored projects in such fields as agriculture and conservation, public health and safety and trade promotion. Membership in 1952 was 150,000. Publications: *Future and Action*, both monthly. Officers (1952): Horace E. Henderson, president; John Thomas, Jr., treasurer. Headquarters: 21st and Main Sts., Tulsa, Okla.

Woman's Christian Temperance Union, National.—The W.C.T.U., founded in 1874 "is an organization of Christian women banded together for the protection of the home" and "the abolition of the liquor traffic." Membership in 1952 was about 400,000; publications include the *Union Signal* (weekly) and the *Young Crusader* (monthly), for children. During 1952 the organization continued its comprehensive educational program, distributing literature and educational films and conducting lectures and summer courses for teachers. Officers (1952): Mrs. D. Leigh Colvin, president; Mrs. H. E. Mielke, corresponding secretary; Mrs. H. F. Powell, treasurer. Headquarters: 1730 Chicago Ave., Evanston, Ill.

Women's Clubs, General Federation of.—Founded in 1890, this organization aims at uniting women's clubs throughout the world to promote education, philanthropy, public welfare, moral values, civics and fine arts. Its 1952 activities included a "Build Freedom with Youth" contest in which 3,000 clubs competed in community improvement projects; promotion of finance forums for women; and an international good will and rehabilitation program which included scholarship awards to foreign students totalling approximately \$25,000. The annual convention was held in Minneapolis, Minn., May 12-17. Membership in 1952 included 810,606 in 14,604 clubs, with a total in affiliated organizations of about 11,000,000 in the U.S. and 34 other countries. Publication: *General Federation Clubwoman* (monthly). Officers (1952): Mrs. Oscar A. Ahlgren, president; Ethel Foster, treasurer; Mrs. E. Lee Ozbirn, recording secretary. Headquarters: 1734 N St. N.W., Washington 6, D.C.

Young Men's Christian Association.—Founded in London, Eng., in 1844, this is a world-wide fellowship seeking to improve the spiritual, social, recreational and physical lives of young people. During 1951 (latest data available in 1952) there were 1,726 Y.M.C.A.s operating in cities and rural areas, with memberships of 2,700,837. More than 144,900 clubs, classes, teams, special-interest groups and councils met regularly with programs emphasizing physical, educational, social and religious features, plus emphasis on citizenship and world affairs. Among high school youth, 9,860 Hi-Y clubs for boys and 3,417 Tri-Hi-Y clubs for girls were functioning. Publications included *National Council Bulletin* and *YMCA Year Book* for 1952. Endowments totalled \$49,598,600. Officers (1952): William J. Grede, president; Eugene E. Barnett, general secretary. Headquarters: 291 Broadway, New York 7, N.Y.

Young Women's Christian Association of the United States of America.—This organization was founded in England in 1855 and in the U.S. in 1858 to build a fellowship of women and girls devoted to the pursuit of Christian ideals in personal and social living. During 1952, 3,000,000 women and girls participated in its activities, which engage women from high school age on. Publications: *The Bookshelf* and *YWCA Magazine*. Officers (1952): Mrs. Edward W. Macy, president; Mrs. F. Beardsley Foster, Jr., treasurer; Mrs. Harrison S. Elliott, general secretary. Headquarters: 600 Lexington Ave., New York 22, N.Y.

Zionist Organization of America.—Founded in 1897, this organization's purpose is to provide assistance to the people of Israel and advance the Jewish cultural renaissance everywhere. During 1952 it sponsored Israel's bond campaign in the U.S.; established five trade schools in Israel and sent food and machinery there; awarded Israeli scholarships; and inaugurated a Hebrew language campaign. Membership in 1952 totalled 175,000. Publications: *The American Zionist*; *The Zionist Quarterly*; *Dos Yiddische Folk*; and *Inside Israel*. Officers (1952): Rabbi Irving Miller, president; Sidney Marks, secretary. Headquarters: 41 E. 42nd St., New York 17, N.Y.

Zonta International.—A service organization of executive women in business and the professions, founded in 1919, this organization encourages high ethical business and professional standards, the improvement of the legal, political, economic and professional status of women, and international understanding through a world fellowship of executive women. Activities in 1952 included the award of \$1,000 scholarships to young women for graduate study in aeronautical engineering in honour of Amelia Earhart and the establishment of girls' clubs and youth centres. Membership in 1952 included about 250 clubs with approximately 9,000 members in the U.S. and 13 other countries. Publications: *Zontian* magazine and pamphlets. Officers (1952-54): Edwina B. Hogadone, Rochester, N.Y., president; Ellen Fireoved, Chicago, Ill., executive secretary. Headquarters: 59 E. Van Buren St., Chicago 5, Ill.

Sociology. During the year 1952 the often-noted trend toward a merger of the social sciences continued, but with new fluctuations, some of them seemingly furthering the merger, and some retarding it. Trend and fluctuations were

most plainly apparent in the United States, where sociology, in particular, was more strongly represented in amount of personnel and publication than anywhere else.

The numerous foundations—Ford, Russell Sage, etc.—had much to do with the fluctuations, notably the stress on the "behavioural sciences." These, comprising sociology, social anthropology and social psychology, received much attention. Social sciences not of "behavioural" type, such as political science, human geography and history, were not so directly favoured—although by no means neglected. It was still too soon to say whether foundation policies were producing scientifically beneficial results, but the policies had already produced, clearly enough, another crop of would-be beneficiaries, all speaking the same language and making the same invocations. Fragments of an earlier language still survived, as witnessed by the continuing currency of "interdisciplinary," "cross-cultural," and so on, but had begun to sound slightly outmoded. British reviewers of "behavioural science" articles and books published in the United States were quick to note these facts, and to comment appropriately.

Efforts directed toward providing a sound basis in general theory for actual or potential merger continued, although without large-scale foundation support. This could hardly have been otherwise, for successful work in abstract theory is difficult to plan, to say the least. There was, however, one planned theoretical enterprise that made its effects felt in 1952; it took the form of a symposium by a Harvard group, *Toward a General Theory of Action*, edited by Talcott Parsons and Edward A. Shils. The most important part of it was the monograph by the editors appearing as the introduction; this was primarily a stimulating treatment of motivation. At about the same time as the symposium was published, Parsons brought out his *The Social System*. This one-man undertaking seemed to embody many of the merits of the symposium without its more serious defects. Notable among the merits was the somewhat boring but necessary "spelling out" of personality system, social system and cultural system as analytically distinct although empirically intertwined.

One of Parsons' predecessors in the realm of social action theory as such was Florian Znaniecki, and in 1952 he in effect summarized, brought up to date and strikingly advanced his 1918, 1925 and 1936 contributions. Znaniecki's 1952 work in action theory, *Cultural Sciences, Their Origin and Development*, was a landmark of great prominence; it did much to clarify concepts such as culture, social action and definition of the situation or "humanistic coefficient," and to show how they interrelate in sociology as "the grammar of the social sciences."

Basic to the work of Parsons, Znaniecki and many other theoreticians was stress on values. This ranged from the definition of all objects as values, through all social action as involving choice between value alternatives to cultural systems as culminating in value systems. In other words, "stress on values" meant many things and the results were many: efforts at measurement of values on the one hand to unabashed espousal of value judgments as scientifically necessary on the other. Plainly, the slogan of "through values to social interpretation" needed less enthusiastic reiteration and more hardheaded pondering.

Some observers felt that in 1952 there was especially evident, among students and established social scientists alike, a value preference for the study of "social statics" as over against "social dynamics." Attention to social structure and to the functions presumably maintaining it took precedence over interest in social change—except when change was viewed as "dysfunction." The uncertainties of the post-World War II period and particularly the defensive position of most western European and American nations vis-à-vis social changes from which

it was believed that they would suffer disadvantage (at least initially) may have had something to do with this. Instead of a "generation on trial" that had once looked favourably on change, there appeared a "generation on tenterhooks."

This, if it was a conclusion representing something more than idle speculation, may have been an aspect of that "normative reaction to normlessness" that frequently becomes evident when social change has been so rapid as to be profoundly unsettling. Whether or not connected with this, it may also be noted that the study of power relations and systems of authority, from democracy to totalitarianism, had been popular among all social scientists of recent years, and that sociologists, directly or indirectly, had made some of their most notable contributions here. The vogue of Max Weber, who wrote much on "authoritative rule" (*Herrschaft*), did not wholly explain this, for many important works about authority took little or no account of him, perhaps because his vogue was based primarily on knowledge of his translated writings and those on authoritative rule had not been translated. (Incidentally, an excellent translation of Weber's *Ancient Judaism*, by H. H. Gerth and Don Martindale, appeared in 1952.) At best, Robert K. Merton and others, in scattered articles and collections of readings, dealt with bureaucracy from a standpoint akin to Weber's. There was needed a sustained systematic treatment of political sociology in general, with or without benefit of earlier writers.

In some ways linked with political sociology, social stratification studies continued to be made, and those sponsored by the University of London were definitely new in emphasis and important in results. Stratification analyses had clearly reached a point of diminishing returns, however, if they continued to be preoccupied with middle-class matters in the United States. Their significance had been much exaggerated anyway, largely because of the tendency of newly fledged "research men" to jump on anything that looked like a bandwagon. Much had been put forth as "the very latest" that in actuality was very old indeed, as was convincingly shown by W. C. Lehmann's article in the *British Journal of Sociology* on the work of John Millar in the 18th century, "On the Distinction of Ranks."

Neglect of the history of sociology, characteristic of the generation of graduate students completing their work since 1945, was partly the result of scarcity of convenient handbooks having adequate coverage. Few students could spare the time, or commanded the languages necessary, to read widely in the original sources. The handicap was to some extent overcome by the republication, with 1952 revision and expansion of a work that first appeared in 1938. This, *Social Thought From Lore to Science*, by Howard Becker and H. E. Barnes, dealt with a wide range of social thinkers, ancient and modern, and seemed likely to be of help in lessening the tendency to succumb to current styles in sociological writing and research.

In England, worthwhile trends in sociological research, already manifested at Birmingham, Manchester, Liverpool, Nottingham and similar "red brick universities" continued, as did the valuable work in social anthropology at Oxford and Edinburgh. The same was true of the social psychology intensively applied, albeit with almost psychoanalytic dogmatism, at the Tavistock Institute of Human Relations. One of the most important changes, generally speaking, in the approach to sociological research seemed to be the at least partial emancipation from the traditional social survey. A number of urban neighbourhood studies, such as those at Banbury and Coventry, granted large place to intensive analyses of social relations in contrast to the customary survey focus on large numbers, sampling and problems of planning.

Where the continent was concerned, the most noteworthy developments in 1952 were those in Germany. Western Germany

HAROLD D. LASSWELL, of the Yale school of law, New Haven, Conn., in a scene from *The Social Process*, an educational film for sociology students released in 1952 by Encyclopædia Britannica Films Inc.

continued its advance: rural and urban sociology, in particular, moved rapidly ahead. There seemed every likelihood, when publication facilities once more became adequate, of contributions so substantial that they would make a distinct impress on research being done elsewhere. Eastern Germany afforded an interesting contrast. Chairs of sociology, where they existed, were abolished; instead, "social science" instruction was installed. This was grounded, by decree, on "diamat" (dialectical materialism), and virtually all the newer social science instructional staff members not only imparted "diamat" in unmixed form but were also adherents of the S.E.D. (equivalent of the Communist party) and products of its training system. Here and there survivors of an earlier and less dogmatic although Marxist point of view continued to lecture, but were being steadily shouldered aside or replaced by exponents of "diamat" whose orthodoxy could not be called in question. Publication took merely polemic form; few or no basic researches, given the taboo on "objectivity" and "cosmopolitanism," could be carried out even if there had been any researchers so inclined. Here eastern Germany provided an interesting comparison with the Soviet Union itself; there was, understandably enough, even less freedom in the satellite than in the dominating country. In the latter some work in social anthropology was being done that permitted the "diamat" to be easily combed out, as it were; what remained was utilizable even by the despised bourgeois researcher concerned only with objective truth.

Sodality of Our Lady: see SOCIETIES AND ASSOCIATIONS, U.S.

Softball. During 1952 the Briggs Beautyware nine of Detroit, Mich., won the world series of the Amateur Softball association for the third time when it swept through six games undefeated in the 20th championship tournament at Bridgeport, Conn. The Detroiters clinched the crown by topping the American Industrial Corporation Flyers of Miami, Fla., 2-1, in the final round. The contest was decided in the fourth inning. Dave Sayyae beat out an infield hit and tallied on an error on Roy Palmeri's drive to tie the count at 1-1, and Palmeri counted a moment later on a passed ball. Briggs finished with six victo-

ries and no defeats while Miami, the runner-up, scored five triumphs against two losses. Johnny Spring proved the outstanding star of the tourney in pitching the new champions to five decisions. Ted Czach was the winning pitcher in the other victory recorded by Briggs, which had won world industrial laurels earlier in the campaign.

The women's championship of the A.S.A. was played in Toronto, Ont., and the Orange Lionettes of California captured the title for the third successive season. The Lionettes won six games out of seven, while the Phoenix (Ariz.) Ramblers and the Fresno (Calif.) Rockets tied for second place with five triumphs and two defeats each. (T. V. H.)

Soil Conditioners: see CHEMISTRY.

Soil Erosion and Soil Conservation. **United States.**—The fiscal year July 1, 1951, to June 30, 1952, set an all-time record of accomplishments in planning and applying soil conservation methods and practices. At the end of the year farmers had organized 2,467 conservation districts in the 48 states, Alaska, Hawaii, Puerto Rico and the Virgin Islands. These districts contained 1,358,913,000 ac. In continental United States, more than 4,926,000 farms and ranches, containing 895,451,000 ac. were within district boundaries. The 36 districts of the Caribbean area, Hawaii and Alaska included an additional 59,926 farms composed of 2,689,000 ac.

During the year technicians of the soil conservation service worked with farmers in 2,404 of the districts, an increase of 88 districts over the preceding fiscal year. This wider spread of technical assistance was made possible by a new and speedier type of progressive farm planning devised by the service and supervisors of soil conservation districts. More than 37,000,000 ac. were covered by conservation surveys, an increase of 7%.

Under the new planning system, initial and advanced phases of conservation plans were prepared for 165,844 farms and ranches covering nearly 54,000,000 ac. At the same time, 86,310 basic plans were completed for farms covering nearly 23,000,000 ac. As of June 30, 1952, more than 1,120,000 farmers and ranchers, whose land comprised 322,000,000 ac., were active co-operators in the soil conservation program. More than 410,000,000 ac. of agricultural land had been surveyed for making conservation plans for individual farms and ranches.

Application of soil and water conservation practices to the land of soil conservation districts by farmers assisted by the soil conservation service increased 7%. Cover cropping, applied during the year on 3,296,085 ac., increased 17%. Seeding of nearly 3,000,000 ac. of range and pasture in the districts was an increase of 26% over the preceding year, and construction of 61,578 new farm and ranch ponds was an increase of nearly 63%. Woodland management and tree planting decreased 7%, while wildlife area improvement on farms increased 140% throughout the total area in soil conservation districts.

Group enterprise plans for conservation drainage, irrigation, special erosion control, water control or water spreading were developed to benefit more than 15,000 farms and nearly 1,000,000 ac.

Totals of some of the important soil and water conservation practices applied in soil conservation districts, as of June 30, 1952, are given in the accompanying table.

Flood control operations in connection with the soil conservation program were continued in 11 watersheds where 28 sub-watershed work plans were prepared for nearly 1,400,000 ac. Emergency farm land restoration and stream channel improvement work in the lower Missouri river basin and along other flooded streams was carried on and largely completed, mainly

Extent of Soil Erosion and Soil Conservation Practices, U.S., 1952

Contour farming	28,601,869 ac.
Cover cropping	19,171,931 ac.
Stubble mulching	47,957,022 ac.
Strip cropping	7,370,853 ac.
Range and pasture improvement	77,869,406 ac.
Seeding range and pasture	12,213,204 ac.
Woodland management	18,882,506 ac.
Farm and ranch ponds built	277,122
Tree planting	931,799 ac.
Terraces	858,967 mi.
Water diversions	36,569 mi.
Conservation farm drainage	7,545,646 ac.
Irrigation land preparation	1,836,923 ac.
Conservation irrigation water use	3,770,108 ac.

by contracts prepared under supervision of the soil conservation service.

During the fiscal year 1952, technicians of the soil conservation service assisted about 500,000 farmer participants in the agricultural conservation program of the Production and Marketing administration with the laying out and supervision of permanent-type soil conservation practices.

A significant trend was seen in the emphasis placed on improvement of soil structure, soil fertility and water-holding capacity of soils used for crop and livestock production. Research to determine ways of restoring plant nutrients taken from soils by cropping, leaching, erosion and flooding, or by plowing or overuse of grasslands, was in progress in many parts of the country. With the raising and maintaining of per-acre yields as the primary aim of the nation's agricultural industry, cropping systems including legumes and grasses, much heavier use of fertilizers, lime and manures, cover crops, stubble mulching and other methods of supplying organic matter were stressed in conservation farm planning. On the basis of many scientific experiments and field trials, it was estimated that per-acre yields of most crops, including pasture, could be raised 60% to 75% if the best-known combinations of erosion control and soil fertility methods were used on all farm land in the United States.

Snow surveys, made seasonally in the western states by the soil conservation service to promote conservation of water, were reported effective during the year in preventing floods as well as in providing forecasts of water available for agriculture. Studies showed that where the snow survey information was used to calculate the storage capacity of reservoirs, little or no flood damage occurred, and at the same time the maximum capacity of water was retained for irrigation. In other places where the forecast information was available but not used, or where it was not available, some reservoirs already filled to near capacity overflowed during peak snow melt, causing severe flood damage and erosion.

Europe.—In the effort to devise ways to increase food production, most European countries made plans to adopt certain soil conservation measures to fit their cropping and livestock systems. Surveys of land conditions made since the end of World War II revealed the need for improvement of soil fertility and soil structure and for control of soil erosion on hill lands and in mountain valleys. Stressed in Italy, Portugal and Yugoslavia was the urgent need for remaking both permanent and temporary pastures and for incorporation of grass-legume crops into rotations.

It was emphasized also that many mountain watersheds should be treated without further delay to prevent floods, decrease erosion and improve soil and plant cover conditions to provide forage for livestock.

The Belgian ministry of agriculture adopted a program to assist farmers, through subsidies, demonstrations and education projects, in grassland reseeding and soil fertility improvement. In Denmark plans were made to test new legumes and grasses, including ladino clover and brome grass from the United States, for use in soil fertility improvement programs. In the Federal Republic of Germany, conservation treatment of grasslands and

supplemental irrigation on cropland were considered of primary importance in building up the agricultural economy. Both wind and water erosion were serious problems in some areas of Germany. It was planned to establish one grassland conservationist in each *Land* of Germany, and one in the federal ministry of agriculture, to introduce conservation techniques of pasture improvement and forage utilization.

The land improvement section, established in the ministry of agriculture of France in 1951, started research in relation to soil conservation and water utilization. Control of wind erosion, cropping and rotations to improve soil structure, and methods of loosening subsoil were problems in Austria.

During the summer of 1952, 56 agricultural specialists from 11 European countries participated in a grassland conservation study course conducted by the U.S. department of agriculture and the land-grant colleges in the United States. Particular attention was given to the activities and services rendered by the soil conservation service, the forest service and the Agricultural Conservation program of the Production and Marketing administration.

Asia.—Under direction of the soil conservation department established in Burma in 1950, eight soil conservation demonstrations were set up in the Shan state during 1951–52. Plans had been completed for three more demonstrations, and work had started to apply them to land in areas accessible to farmers for observation.

In the Philippines, additional trained personnel, equipment and facilities for extending both conservation research and operations on farms were made available to the bureau of soil conservation. Soil and water conservation surveys were being made, by provinces, for use in farm planning, and a broad program was being drafted, to cover the entire country, under provisions of the National Soil Conservation act passed by the congress of the Philippines in June 1951.

Land surveys in Pakistan showed that more than one-third of the 10,000,000 ac. of irrigated land in West Punjab was in danger of going out of production because of waterlogging and salinization. A project was started to reclaim 12,000 ac. so seriously affected as to kill crops. Irrigated date palm groves in Saudi Arabia also were found to be heavily impregnated with salts. Reclamation with deep plowing, to break up the impervious layer of soil, followed by flooding to leach out excessive salts, was necessary before conservation use and practices could be applied. A study of Saudi Arabia's ancient water sources was in progress to determine whether they could be restored to provide irrigation water.

A conservation land use program for all Israel was completed early in 1952.

Africa.—In Southern Rhodesia, an exceptionally well-rounded soil and water conservation program was in operation, with excellent co-operation from farmers. Protection of arable land was the main consideration, and by the end of 1951 nearly all of the colony's cultivated land was protected by contour ridges, storm drains, bench terraces, irrigation furrows and pasture furrowing. About 1,000 water storage dams had been constructed. There were about 80 farmers' intensive conservation areas, similar to soil conservation districts in the United States. Most of the actual work of applying conservation to the land had been done by farmers, with technical assistance from the department of conservation and extension.

Another outstanding soil and water conservation program was being carried out in the native African state Basutoland, with a total area of 7,500,000 ac. More than half the sloping cultivated land had been protected by contour grass strips and heavy diversion terraces above fields. Vegetation on 3,000 sq.mi. of denuded mountain grazing land, placed under controlled grazing

in 1940–45, was recovering rapidly. In the lowlands, 280,000 ac. had been stabilized by graded furrows, and 300 earth dams with a total capacity of 400,000,000 gal. of water had been built. Tree planting and soil fertility methods were stressed during 1951–52.

The work in Basutoland began in 1936 on the property of the paramount chief, who later placed responsibility for maintenance in the hands of the ten local chiefs and their officials. The responsibilities were written into the Laws of Leretholi, the laws and customs of Basutoland. Veldt burning was prohibited. Critically eroded areas were closed for cultivation. Plowing up and down slope was made illegal, and grazing areas could not be plowed without permission of the chief. The soil conservation program already had brought remarkable benefits in doubled and tripled per-acre yields of maize and other food crops, and also an inclination on the part of native farmers to form larger compact units and to create a farmer class that eventually might become efficient and permanent on the land. (See also AQUEDUCTS; DAMS; IRRIGATION.) (R. M. S.)

Solar System: see ASTRONOMY.

Solomon Islands: see PACIFIC ISLANDS, BRITISH; TRUST TERRITORIES.

Somaliland, British: see BRITISH EAST AFRICA.

Somaliland, French. This overseas territory of the French union in the Gulf of Aden is bounded north by Eritrea, northwest and southwest by Ethiopia and southeast by British Somaliland. Area: 8,376 sq.mi. Pop. (1951 est.): 55,000, including 21,000 Danakils, 15,700 Somalis, 5,600 Arabs and 2,000 Europeans (1,260 French). Capital, Jibuti (pop., 1949 est., 22,000). Governor, Numa Sadoul.

History.—In Jibuti, as part of the development plan, sanitary improvements, new streets and the construction of a stadium and of buildings for the representative council and for the civil service were begun in 1952.

More salt was sold. The tonnage of goods in transit through Jibuti increased by 10%. The territory's budget showed deficits of 50,000,000 Jibuti francs on foreign account and 792,000,000 Jibuti francs on the French account (military expenditure, civil service, salaries, government investments).

Education.—Pupils and students (1952): primary 1,400; technical 120. Bursaries in France 3.

Finance and Foreign Trade.—(1951) Imports 3,250,000,000 Jibuti fr.; exports 1,241,000,000 Jibuti fr. (coffee re-exported 840,000,000 Jibuti fr.; hides re-exported 127,000,000 Jibuti fr.; salt 55,000,000 Jibuti fr.). Monetary unit: Jibuti franc=1.64 metropolitan francs. U.S. \$1=350 metropolitan francs.

Communications.—(1951) Ships entered 835, cargo handled 612,000 metric tons; 676 metric tons of freight and 5,750 passengers passed through the airport. (Hu. De.)

Somaliland, Italian. This is an Italian trust territory (former colony) in east Africa, bounded southeast by the Indian ocean, west by Kenya and northwest by British Somaliland and Ethiopia. Area: 198,000 sq.mi. Pop. (1951 est.): 1,247,000. Religion: Moslem. Capital, Mogadishu (pop. about 74,000). Administrator, Giovanni Fornari.

History.—During 1952, the second full year of Italian trusteeship designed to turn Somaliland into an independent sovereign state by 1960, the political and administrative structure continued to take shape. The territory's administration was debated at length during the session of the United Nations Trusteeship council in June. Reports by Italy, the U.N. Advisory council and a special U.N. visiting commission, as well as petitions from the inhabitants, provided the material. A lack of harmony in the advisory council itself was revealed and criticism was levelled at the administering authority by "anticolonial" delegations. There was a general realization of the complexity

and difficulty of the task facing the authorities, and in general their activities were endorsed.

The Somaliland Territorial council considered several proposals for administrative reform, but its deliberations were hampered by political differences among the members. The Somali Youth league remained generally antagonistic to the regime but showed some degree of co-operation with it in non-controversial matters. There were outbreaks of intertribal fighting and minor political disturbances, but not on a scale (for Somaliland) to excite particular comment.

The long-standing dispute over the undemarcated Ethiopian-Somaliland boundary, which had been a potent factor in the outbreak of the Italo-Ethiopian war and still provoked border incidents, remained untouched. The urgency of a settlement was emphasized by the Trusteeship council. (See also TRUST TERRITORIES.) (F. E. St.)

Education.—Schools (1951): 68 elementary (6,892 pupils); 11 secondary (550 pupils). School of administration, 37 students.

Finance and Trade.—Budget 1950-51 (in somali): revenue 55,907,454 (including grant-in-aid from Italy, 30,527,324); expenditure 55,907,454. Foreign trade (somali, April 1-Dec. 31, 1950): imports 43,632,289; exports 18,816,107. Principal exports (value in somali, April 1-Dec. 31, 1950): bananas 5,504,447; cotton 2,139,351; hides 4,928,583. Monetary unit: somalo (one somalo = 1s. sterling = 14 cents U.S.).

South Africa, British: see BRITISH SOUTH AFRICAN TERRITORIES.

South Africa, The Union of. A self-governing member of the Commonwealth of Nations, the Union of South Africa extends from the southernmost point of the African continent northward to the Limpopo, Molopo and western Orange rivers. The mandated territory of South-West Africa is administered by South Africa. (See also TRUST TERRITORIES.)

The population of the Union included: European 2,643,187;

Province	Area (sq. mi.)	Population (1951 census*)	Capital (total and European pop.)
Cape of Good Hope	277,113†	4,417,330	Cape town (571,638; 242,493)
Natal	35,284	2,408,433	Pietermaritzburg (74,399; 31,512)
Orange Free State	49,647	1,018,207	Bloemfontein (109,130; 47,856)
Transvaal	110,450	4,802,405	Pretoria (283,148; 149,614)
Total, Union of South Africa	472,494	12,646,375	
South-West Africa	317,725	430,354	Windhoek (1946 census, 14,933; 6,985)

*Revised preliminary figures.

†Including Walvis Bay (430 sq.mi.; pop., 1946 census, 2,270), union territory administered with South-West Africa.

Bantu 8,535,341; coloured (mixed) 1,038,766 (923,914 in Cape Province); Asian 365,524 (299,068 in Natal); Cape Malay 63,557 (56,543 in Cape Province). Pop., South-West Africa: European 49,641; African 380,686; Malay 16; Asian 11. Language: official languages (1946 census, Europeans only), 69% spoke Afrikaans and English, 17% English only, 14% Afrikaans only; Africans, generally Bantu. Religion: (Europeans, 1946 census) Dutch Reformed Church 55%, Anglican 19%, Methodist 6%, Presbyterian 5%, Roman Catholic 5%, Jewish 4%, other 6%; (non-Europeans) 51% Christian.

Capetown is the seat of the legislature, Pretoria that of the government and Bloemfontein that of the supreme court. Other principal towns (total pop. and European pop., 1951 census) are: Johannesburg (880,014; 359,539); Durban (475,026; 148,980); Port Elizabeth (187,071; 78,315); Germiston (149,982; 65,854); East London (90,695; 43,668); Springs (115,880; 31,389). Governor general in 1952: Ernest George Jansen; prime minister and minister of external affairs: Daniel Malan (q.v.).

History.—A prolonged constitutional crisis dominated the South African political scene throughout 1952. On March 20, in the case of *Harris v. Minister of the Interior*, in the appellate division of the supreme court, five judges unanimously held invalid the act passed by parliament in 1951 altering the franchise of Cape coloured voters. The judgment was based on the fact that the act had not been passed by a two-thirds majority of both houses of parliament at a joint sitting, as required by the entrenched clauses of the constitution. These clauses, the court held, had not been affected by constitutional developments since union. This decision came as a blow to the government, which promptly rejected its legal implications. After bitter debates parliament passed a new act designed to avoid the legal consequences of the court's ruling. This act established a "high court of parliament" to review any judgment of the appellate division of the supreme court that declared invalid any part of any act passed since Dec. 11, 1931, when the statute of Westminster took effect. Every member of parliament was made a member of the court. Two months after the parliamentary session, the high court met in secret session at Pretoria, but no member of the opposition parties took part in its proceedings. On the recommendation of its judicial committee, the high court, presided over by the speaker of the house of assembly, set aside the appeal court's decision. In a considered judgment, published later, the high court reviewed and rejected the legal grounds on which the appeal court had based its decision. Meanwhile, steps had been taken by the same litigant, a coloured voter, G. Harris, to contest the validity of the High Court of Parliament act itself. Two days after the high court had announced its decision, a full bench of three judges of the Cape provincial division of the supreme court held that the High Court of Parliament act was itself invalid because it disregarded the entrenched clauses of the constitution and sought to circumvent them. The government then appealed against this decision to the appellate division of the supreme court, whose judgment was awaited late in 1952. The government continued to defend its view that parliament must be supreme, while the opposition maintained that the rule of law as interpreted by the ordinary courts must be upheld.

Both the principal political parties, preparing for the general election in 1953, regarded this issue as an outstanding one. The United party, the Labour party and the Torch Commando (war veterans' political organization) formed a "united democratic front" against the government. In the only by-election during the year, in the rural Transvaal constituency of Wakkerstroom, the government retained the seat with a substantially increased majority. The delimitation commission, at work revising constituency boundaries, announced that the Transvaal would be entitled to two new seats.

In Natal the government's attitude to the constitution evoked heated opposition, part of which even contemplated secession of the province from the Union under certain circumstances.

Race Relations.—The African National congress, under James Moroka, and the South African Indian congress, under Y. M. Dadoo, had resolved in Dec. 1951 to embark jointly on "a campaign to defy unjust laws" unless the government repealed laws involving racial discrimination. The prime minister, D. F. Malan, explained his policies and warned the congresses that any disturbances would be quelled. On April 6 protest demonstrations were held in several centres, coinciding with the Van Riebeeck celebrations marking the tercentenary of white settlement at the Cape. The second phase of the campaign began on June 26, when volunteers invited arrest by breaking various apartheid and pass laws. Within the first three months of the campaign more than 4,000 non-Europeans were arrested and most of them imprisoned. The government took a serious view of this movement of passive resistance and threatened heavier penalties for the resisters. In Johannesburg 20 African and Indian leaders were put on trial under the act to suppress all forms of Communism.

Anti-Communist Measures.—A member of the house of assembly, Sam Kahn, elected in 1948 by Africans in the Cape western area, was expelled after a select committee had decided that he was promoting Communism. A member of the Cape provincial council, Fred Carneson, lost his seat for the same reason. Applying the act to suppress Communism, the minister of justice, Charles Swart, compelled several leading trade unionists to resign their offices, including Emil Sachs, general secretary of the big Garment Workers' union in the Transvaal. Disturbances occurred in Johannesburg, and people were injured through police action, when Sachs was arrested at a public meeting. Sachs was later convicted under the act and sentenced to six months' imprisonment. The government was criticized by trade unions and by the parliamentary opposition for its policies, which were held to restrict the freedom of the unions.

The Industrial Legislation commission issued a comprehensive report on labour laws. It recommended, *inter alia*, a national labour board to co-ordinate wages and conditions of employment and other amendments to existing legislation. It also recommended the strict separation of white and nonwhite workmen in different trade unions. It advised the legal recognition of African unions provided that important safeguards to control their activities were observed. New legislation based on this report was contemplated but no action was taken. The South African Trades and Labour council sponsored publication of a new bilingual weekly, *Saamtrek*, to defend the interests of organized labour.

A weekly newspaper, the *Guardian*, published in Capetown since 1937, was declared to be Communist and banned. However, a new weekly, the *People's World*, was promptly produced under the same auspices.

Economic Position.—The annual budget was presented to parliament in March by N. C. Havenga, minister of finance. In 1952-53 additional revenue was anticipated from increased customs and excise duties on cigarettes, tobacco, beer and mineral

TABLE MOUNTAIN, Capetown, lit up by anti-aircraft searchlights in April 1952, during festivities marking the 300th anniversary of the settlement of white men in South Africa

waters, leaving an estimated surplus of £1,400,000. A special defense equipment account was opened to provide, over the following two years or so, about £40,000,000 for armaments purchased mainly from U.S. sources.

In his annual review of the Union's finances, presented in July, M. H. de Kock, governor of the South African Reserve bank, reported deterioration in the balance of payments and a decline in gold reserves. The Union agreed to assist the sterling area in its financial crisis, if necessary by sacrificing imports from nonsterling areas. It continued to press for a higher world price for gold. An unprecedented level of economic activity was maintained and the net national income continued to rise.

The production of uranium was begun, thanks partly to loans to the gold mines from the British government. There was continued expansion in the production of other base minerals, mainly because of U.S. interest. Large rock-phosphate deposits in the northeastern Transvaal were acquired by the government, which took steps to exploit and develop them.

At the United Nations general assembly in Dec. 1951 South Africa had again been under attack for its policy toward South-West Africa. As a result, T. E. Dönges, minister of the interior, its chief representative at that session, was temporarily withdrawn in protest. Further negotiations, proposed by the assembly, between South Africa, India and Pakistan on the treatment of Indians in the Union did not take place because of failure to reach preliminary agreement on the basis of discussion. (See also LAW.)

(JU. L.)

Education.—State schools (1947): primary 1,190 (European 1,110), pupils 115,368 (European 92,291), teachers 3,927; secondary and high

schools 241, pupils 75,339 (European 65,232), teachers 3,122; mission schools 3,031; training institutions (European 9), pupils 3,790 (European 874), teachers 218. Private schools (1948): kindergarten 89; primary 672; secondary 112; commercial and business 19; others 5; pupils at all private schools 65,089 (European 35,887). Technical colleges (1948) 11, students 46,000, teachers 2,150. Universities (1951) 9; total enrolment of students (1949) 23,977.

Finance and Banking.—Budget: (1951-52 actual) revenue £(S.A.) 226,300,000, expenditure £(S.A.) 270,200,000; (1952-53 est.) revenue £(S.A.) 207,400,000, expenditure £(S.A.) 205,900,000. National debt (June 1952) £(S.A.) 818,600,000. Currency circulation (July 1952) £(S.A.) 83,700,000. Bank deposits (July 1952) £(S.A.) 314,700,000. Gold and foreign exchange (Aug. 1952) U.S. \$333,000,000. Monetary unit: South African pound at par with the pound sterling and with an exchange rate (Nov. 1952) of £(S.A.) 0.357 to the U.S. dollar.

Foreign Trade.—(1951) Imports £(S.A.) 469,100,000, exports £(S.A.) 343,100,000. Main sources of imports (1951): U.K. 35%; U.S. 19%; Canada 4%; Germany 3%. Main destinations of domestic exports: U.K. 24%; France 15%; U.S. 11%; Southern Rhodesia 8%. Main imports: metals, metal manufactures, machinery and vehicles 35%; textiles and clothing 26%; petroleum and products 6%. Main exports (excluding gold and bullion): wool 24%; semiprocessed gold 15%; diamonds 8%; nonferrous metals 5%.

Transport and Communications.—Roads (1950): national 6,000 mi.; provincial main roads 80,715 mi. Licensed motor vehicles (Dec. 1950): cars 466,000, commercial 134,000. Road services (1949-50): passengers conveyed 13,800,000; freight carried 1,754,500 metric tons. Railways (1950): 13,942 mi.; freight ton-miles 11,570,000,000; freight carried 39,600,000 metric tons. Shipping: merchant vessels, 100 gross tons and over (July 1951) 158; total tonnage 160,862. Air transport (1950): passenger miles 125,000,000; cargo net ton-miles 4,200,000. Telephones (1951): 458,851. Radio receiving-set licences (Dec. 1949): 531,300.

Agriculture.—Main crops (metric tons, 1951): maize 1,635,000; wheat 652,000; oats (1950) 115,000; potatoes 240,000; dry beans 32,000; sugar, raw value 482,000; groundnuts 113,000; sunflower seed (1950) 51,000; tobacco (1950-51) 19,700; grapes (1949-50) 430,000; oranges and tangerines 213,000; grapefruit 17,000; lemons 5,000; raisins (1948) 8,700. Wine production (1950-51) 2,670,000 hl. Livestock (Aug. 1949): cattle 12,242,000; sheep (Sept. 1950) 31,361,000; goats 5,529,000; pigs 761,000. Meat production (metric tons, 1951): total 401,000, of which beef and veal 272,000, pork 51,000. Dairy production (metric tons, 1951): butter, factory production 29,900; cheese, factory production 9,600. Wool, clean basis (1951) 50,000 metric tons. Fisheries: total catch (1949) 125,000 metric tons. Fish oil production (1951) 644,400 metric tons.

Industry.—Industrial establishments (1948-49): 14,361; persons employed 670,000 (Europeans 228,000). Fuel and power (1951): coal, sales 26,112,000 metric tons; electricity, sales 11,664,000,000 kw.hr. Raw materials (metric tons, 1951): iron ore, metal content 1,416,000; pig iron 804,000; steel ingots and castings 1,008,000; copper, smelter 33,100 (short tons); chrome ore 600,000; manganese ore 836,000; asbestos 107,000; gold 11,516,000 fine oz.; diamonds 2,228,000 metric carats; silver 1,164,000 fine oz.; osmiridium 6,359 oz. Cement (1951) 1,953,000 metric tons. Leather footwear (1951) 13,276,000 pairs.

South Carolina. A south Atlantic state of the United States, eighth of the original 13 to ratify the constitution (1788), South Carolina is known as the "Palmetto state." Area: 31,055 sq.mi. (750 sq.mi. inland water). Population (1950): 2,117,027, an increase of 11.4% over 1940; 61.1% white, 38.9% nonwhite (almost entirely Negro), 63.3% rural. Capital: Columbia. Chief cities (with populations): Columbia (86,914); Charleston (70,174); Greenville (58,161); Spartanburg (36,795); Rock Hill (24,502); Florence (22,513).

History.—In its shortest session since 1942, the legislature passed an automobile drivers financial responsibility law, opened public welfare rolls to public inspection, refused to tamper with the year-old retail sales tax, sustained the governor's veto of a bill to divert to local governments a larger portion of liquor tax proceeds, consolidated three agencies into a wildlife resources commission, and authorized a \$5,000,000 improvement program for the state hospital for the mentally diseased.

The most notable constitutional development of the session was the initiation of an amendment repealing the constitutional requirement of state support of public schools. Ratification would enable the legislature to abandon public schools, as advo-

cated by Governor Byrnes, rather than accept an adverse U.S. supreme court decision in the Clarendon County school segregation case. The court's hearing, scheduled for Dec. 8, was on appeal from a ruling of a three-judge federal court which March 13 reaffirmed its 1951 decision upholding segregation on an equal facility basis.

Civil rights issues also featured political party activity as Governor Byrnes urged the south to withhold support from an "unacceptable" Democratic presidential candidate or platform. The state convention sent delegates to Chicago pledged to Sen. Richard Russell and postponed choice and pledge of electors until results of the national convention appeared. Reassembling after the bitter Chicago controversy, the state convention, with Byrnes's approval, pledged electors to the party nominees. But the governor endorsed efforts of disaffected Democrats to nominate Dwight D. Eisenhower electors by petition, indeed, signed the petition and soon announced that he would vote for the general.

The chief state officials in 1952 were: J. F. Byrnes, governor; G. B. Timmerman, lieutenant governor; C. F. Thornton, secretary of state; T. C. Callison, attorney general; J. B. Bates, treasurer; E. C. Rhodes, comptroller general; J. T. Anderson, superintendent of education.

Education.—The educational expansion program begun in 1951 yielded significant results. By June 30, 1952, more than \$19,000,000 of state aid had been approved for construction, 78% for Negro schools. State expenditures for current expenses increased from \$34,910,817 to \$40,895,047 for white schools; from \$14,392,448 to \$18,212,537 for Negro schools. Total state expenditures were \$80,677,781. Consolidation of school districts reduced the number from 1,220 to 219; the number anticipated for June 30, 1953, was 100. Enrolment in white elementary schools was 198,167, an increase of 4,928; in Negro elementary schools, 187,975, an increase of 443; in white high schools, 86,374, an increase of 1,799; in Negro high schools, 39,683, an increase of 1,939. Total white and Negro teachers numbered, respectively, 10,345 and 7,134.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ending June 30, 1952, public expenditures for the relief of needy persons amounted to \$19,124,290, of which \$12,997,176 were federal funds. As of June 30, assistance was being given to 49,247 aged, 1,962 blind, 26,597 children, 5,245 totally and permanently disabled, and 2,121 persons needing general assistance, a total of 85,172 persons. Payments totalling \$7,747,219 were made to unemployed persons during the year; the employment security trust fund was \$59,869,266 on June 30. Patients in the state hospital for mentally diseased, June 30, numbered 5,506; in the school for feeble-minded, 1,339; prisoners in the penitentiary, 1,618; in Negro boys' reformatory, 153; in reformatory for white boys, 210; in Negro girls' reformatory, 28; in reformatory for white girls, 105.

Communications.—State highway mileage, June 30, 1952, was 22,963 of which 14,595 was paved; rural mileage outside of the state system was 26,192. State highway department receipts of \$44,445,295 included \$30,194,160 from the gasoline tax of \$36,654,512; expenditures for construction and operation totalled \$46,233,536. Total railway mileage was 3,372. Company-owned telephones numbered 272,306 on June 30.

Banking and Finance.—On June 30, 1952, there were 25 national banks with 39 branches, 103 state banks with 16 branches and 20 cash depositories. Capital account, deposits and resources, respectively, were: national,

\$28,201,000, \$490,472,000, \$522,808,000; state banks and depositories, \$23,992,674, \$280,620,294, \$305,331,743. Resources of the 34 federal building and loan associations totalled \$133,741,909; of the 41 state associations, \$50,269,079. For the year ended June 30, 1952, the state operated under a general appropriations budget of \$144,499,437 and showed a surplus of \$9,865,843; the general appropriations for the year begun July 1 totalled \$140,674,071. On June 30 the state funded debt was \$76,960,347. Federal internal revenue taxes amounted to \$263,411,838; customs collections, \$2,967,458. The value of imports was \$57,800,000; of exports, \$105,800,000.

Agriculture.—The official Oct. 1 estimate of the total 1952 value of field and commercial truck crops was \$347,336,000 or 12% less than in 1951, when the estimated value was \$396,442,000 and when cash income (including government payments) amounted to \$416,789,000, an all-time record.

Manufacturing.—The value of products manufactured in 2,036 establishments during the year ended June 30, 1952, was \$2,225,713,452, a decrease of \$4,794,468 from the previous year. Employees numbered 185,905, an increase of 2,309. Total manufacturing capital was \$1,047,515,695, an increase of \$180,230,593.

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in South Carolina in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. South Carolina ranked 42nd in value of mineral output, with 0.10% of the U.S. total.

Table III.—Mineral Production of South Carolina

Mineral	1950 (In short tons)		1949	
	Quantity	Value	Quantity	Value
Clays	955,000	\$4,996,000	664,000	\$3,796,000
Sand and gravel	348,000	167,000	287,000	145,000
Stone	2,558,000	3,836,000	2,441,000	3,629,000
Other minerals	2,395,000	...	1,456,000
Total		\$11,394,000		\$9,026,000

South Dakota. A north-central state of the United States, popularly known as the "Coyote state," South Dakota was admitted to the union in 1889. Area: 77,047 sq.mi., of which 511 sq.mi. are water. Population (est. July 1, 1951) 647,000, a decrease of 5,740 since the 1950 census. In 1950 the state had 23,334 Indians and 727 Negroes; foreign born numbered 29,990 but only .5% of the population 21 and over were aliens. Capital: Pierre (1950 pop., 5,715). Principal cities: Sioux Falls (70,910), Rapid City (25,310) and Aberdeen (21,051).

History.—The state legislature did not meet in 1952, but politics loomed large during the year. In a heated primary campaign, considered nationally as a crucial test of strength prior to the national convention, Robert A. Taft won over Dwight D. Eisenhower by a fraction of 1%. The South Dakota delegation to the Democratic convention won notoriety by walking out of the convention at one point following disagreement with the chairman, Speaker Sam Rayburn.

Drought in all but the southeastern corner was the most important development within the state, following a flood of the Missouri river in the spring, which inundated the state capital, Pierre, and rivalled the great flood of 1881. Earth-fill work was under way for federal dams at Gavins Point and Oahe on the Missouri, while the Ft. Randall dam was nearing completion. Local opposition to the Oahe project as it affected the James river valley resulted in a recommendation of a subcommittee of the Legislative Research council that the 1953 legislature "consider the advisability" of memorializing congress, requesting that all construction funds be withheld from the Oahe-James irrigation project unless the project was shown to be (1) necessary, (2) economically feasible, and (3) desired by the people in the area affected by the project.

State officials (all Republican) finishing out their two-year terms in 1952 included Sigurd Anderson, governor; Rex Terry, lieutenant governor; Ralph A. Dunham, attorney general; Geraldine Ostroot, secretary of state; and Theodore Mehlhaf, treasurer.

Education.—There were 308 high schools maintained in South Dakota in 1952, with 2,153 teachers and 32,373 students, an increase of 3,000 over the previous year. Elementary teachers in city schools numbered 2,338. There were 3,036 common school districts with 2,981 teachers in 2,923 schools. Total expenditures for education were \$30,746,494. Harold S. Freeman was superintendent of public instruction.

Social Insurance and Assistance, Public Welfare and Related Programs.—

During the fiscal year 1951-52 the state department of public welfare distributed \$5,937,815 among 11,983 persons in old-age assistance; \$2,191,387 as aid to 6,069 dependent children; \$62,427 to 152 persons under a new program for the disabled; and \$99,308 for the needs of 213 blind persons. Unemployment benefit payments during 1951 were \$714,610 at an average weekly rate of \$17.58 to a total of 4,434 individuals. The state maintained one prison and one training school on appropriations of \$600,618 for each year of the biennium. There were 445 inmates at the prison.

Communications.—In the fiscal year 1951-52 the state maintained a highway system of 6,193.8 mi., including 3,126 mi. of bituminous surface, 437 mi. of concrete pavement, and 2,630 mi. of gravel surface, at a maintenance cost of \$5,320,045. Disbursements for construction had risen from roughly \$8,000,000 in 1949-50 to \$9,000,000 in 1950-51 and to nearly \$14,000,000 for 1951-52. There were 4,668.2 mi. of railroad in operation as of Dec. 31, 1951, and 157,984 telephones.

Banking and Finance.—At the start of 1952 there were 35 national banks and 21 branch banks in operation. Their total assets were \$294,166,000 and their total deposits were \$276,653,000. The 134 state banks with 4 branches had assets of \$272,407,491 and deposits of \$253,715,797. Eight building and loan associations reported total assets of \$7,173,330.

Total receipts of the state treasury for the fiscal year ending June 30, 1952, were \$73,503,775; disbursements were \$72,802,615. Bonded indebtedness, stemming largely from a veterans' bonus and a disastrous rural credits program of the 1920s totalled \$20,815,000. There was a sinking fund total of \$17,775,531 to meet this indebtedness.

Federal internal revenue collections for fiscal 1951-52 amounted to \$5,996,679, of which \$46,170,146 was attributable entirely to income tax; \$24,224,450 was in payment of combined withholding income tax and social security tax.

Agriculture.—Through August, farm receipts from major sources were slightly above those of the previous year and total cash receipts for the year were expected to be higher. Cash receipts from farm marketings during the first half of 1952 were estimated at \$243,999,000. Government payments in 1951 totalled \$6,473,000.

Industry.—According to the 1947 census of manufactures, there were 494 establishments engaged in manufacturing, paying a total of \$25,796,000 in salaries and wages to 10,265 employees. The total value added by manufacture was \$51,398,000. In June 1952, there were 11,800 employees. Meat products, creamery and poultry products provided the bases for the leading industries. A state-owned cement plant produced 1,020,868 bbl. of finished cement in 1951.

(Ev. W. S.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in South Dakota in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. South Dakota ranks 1st among the states in the production of gold, and stands 35th in the value of mineral output, with 0.28% of the U.S. total.

Table I.—Principal Crops of South Dakota

Crop	Indicated 1952		1951	Average 1941-50
	1952	1951

Soybeans. The 1952 soybean crop of the United States was indicated at 286,209,000 bu., 2% more than the 280,512,000 bu. of 1951 and exceeded only by the 299,000,000 bu. of 1950. Harvested acreage was 13,906,000, as compared with a government-suggested goal of only 13,000,000. The yield was 20.6 bu. per acre, compared with 21.2 bu. in 1951 and an average of 19.4 bu. for the decade. Illinois was the leading producer (85,701,000 bu.), followed by Iowa (34,525,000 bu.), Missouri (34,240,000 bu.) and Indiana (33,322,000 bu.).

Prices moved sharply and erratically during the year, rising to the ceiling (\$3.33 per bushel at Chicago, Ill.) in midsummer, only to decline with the assurance of the abundant new crop. The price to farmers in September at the beginning of the 1952 harvest was slightly below \$3.00 per bushel compared with a government support price of \$2.56 per bushel (\$2.45 per bushel on the 1951 crop). Operations of processors were somewhat disorganized during part of the year by an unfavourable price ratio between the raw bean and the products: specifically, soybean-oil prices declined to the 9- to 12-cent per pound range, several cents below the previous year, whereas soybean meal was until April at a ceiling of \$74.00 per ton. The Office of Price Stabilization thereafter raised the ceiling price to \$81.00, then in the autumn lifted it still further to \$87.00 per ton. Meanwhile, prior to the autumn, mixtures of the meal with lower priced feedstuffs were widely and legally marketed at prices above the meal ceiling.

World soybean production in 1952, although reliable information was lacking for a major producer, China, and other Communist-controlled areas, was estimated as near the 1950 record-crop of 666,430,000 bu. The 1935-39 average was only 463,720,000 bu.

United States exports of soybeans (and oil in bean equivalent), which reached 79,000,000 bu. from the 1950 crop, was less than 50,000,000 bu. from the 1951 crop and was expected to decline further, not only because of decreased demand in western Europe but also because of increased competition from Manchuria on a quality basis. (J. K. R.)

Spain. A country of southwestern Europe, Spain is bounded north by the Bay of Biscay and France, west by the Atlantic and Portugal, and south and east by the Mediterranean. Area: 194,945 sq.mi., including Balearic (1,936 sq.mi.) and Canary (2,804 sq.mi.) islands. Pop.: (1940 census) 25,877,971; (1950 census) 27,909,009, including Balearic (422,127) and Canary (776,912) islands; (1952 est.) 28,306,000. Language: mainly Spanish (Castilian) but Catalan, Galician and Basque are also spoken. Religion: Roman Catholic. Chief towns (pop., 1950): Madrid (cap., 1,609,524); Barcelona (1,205,509); Valencia (509,075); Seville (375,401); Málaga (261,162); Zaragoza (261,084); Bilbao (229,091); Murcia (201,259); Córdoba (165,256). Leader (*caudillo*), chief of state and prime minister, General Francisco Franco (*q.v.*).

History.—The salient feature of the year 1952 in Spain was the continuation of a general improvement in economic conditions because of the weather. Favourable results of the change first appeared toward the end of 1951 when, after a sequence of disastrous droughts, a period of beneficial rain had brought relief to a predominantly agricultural country and helped its rulers to combat inflation. Abundant harvests had simplified the government's task, for several crops had surpassed all expectation; and with staple foods in adequate supply, as prices dropped to a relatively normal level, the main black markets quickly became extinct.

General Franco's New Year message for 1952 was broadcast directly after the announcement by the acting chief of the Mutual Security agency in Europe that a U.S. special mission would shortly be sent to Madrid with the object of drafting the terms of a military and economic agreement between Spain and the United States along the lines previously explored by Adm. Forrest P. Sherman. Two teams of experts from Washington, under Maj. Gen. James W. Spry and Sidney Sufrin, had already spent several months in Spain surveying the primary requirements of a potential ally whose value to the cause of western defense was warmly advocated by Stanton Griffiths, the U.S. ambassador, until his resignation in January, for reasons of health,

SPANISH ARMY units on parade in Madrid during an official visit of Prince Abdul-Ilah of Iraq (on reviewing stand with General Franco) in May 1952. Earlier in the spring, a Spanish friendship mission made an official tour of Arab countries

from a post which he had not occupied a year. At the end of March his successor, Lincoln MacVeagh, presented his credentials to the *caudillo*, and a fortnight later George Train arrived in Madrid from Mutual Security agency headquarters to join Maj. Gen. August W. Kissner and their respective assistants in discussing the bilateral pact with the Spaniards. By then, however, impatience with the state department's "dilly-dallying attitude" had been vented in the Spanish press and Alberto Martín Artaño, the foreign minister, had left for the middle east as General Franco's personal envoy at the head of a good-will mission to half a dozen Moslem courts. The talks were put off until the diplomat's return.

In January, when the U.S.-Spanish accord seemed imminent, 35 warships of the U.S. 6th fleet had paid a courtesy visit to eight Spanish Mediterranean ports; but thereafter the negotiations dragged on so long that both parties felt obliged at intervals to give assurances of their readiness to reach an understanding.

Spain was excluded from the North Atlantic Treaty organization—and it would refuse to beg admission to it, General Franco proudly declared, because ultimately Spain's fate must depend on the strategic strength of the Iberian bloc as the vital middle link between east and west. In April, with the U.S. callers in his waiting room, the *generalísimo* hastened to confer with António de Oliveira Salazar, the Portuguese premier, at Ciudad Rodrigo. The Spaniards were losing interest in the panacea of U.S. aid, since the remainder of the \$62,500,000 credit that had been granted to Spain two years before was not forthcoming. Their attention was more closely engaged by such domestic realities as the benign meteorological aspect of another mild cycle and the gradual removal of restrictions, which culminated on June 1 in the end of rationing throughout the country, when olive oil and sugar followed liquid fuels and bread on to the free market. In September Spain paid off the balance of a \$50,000,000 debt to holders of International Telephone and Telegraph company bonds that were not due for

redemption until 1960, whereas an adverse legal decision had been given in June against the Barcelona Traction, Light and Power company when its assets were delivered by the receivers in bankruptcy to a newly created Spanish firm.

In April, after rioting had caused six deaths among the native population of Tangier (*q.v.*) on the anniversary of the Franco-Moroccan treaty, Spain lodged a protest with the seven other member states on the control committee and called for revision of the 1945 agreement, which curtailed its share in the administration of the international zone.

On Spanish soil the outstanding event of the year was the celebration at Barcelona in May of the 35th World Eucharistic congress, which drew hundreds of thousands of Roman Catholic pilgrims from all corners of the globe. Cardinal Federico Tedeschini attended the congress as papal legate, and General Franco chose the occasion to visit the city, with his mounted Moorish escort, for the first time since 1949. During his stay in Catalonia he presided at the solemn reburial of the remains of Jaime I and other mediaeval kings of Aragon in the restored monastery at Poblet. Among the principal engineering works and public buildings which the *caudillo* opened in the course of the year were a synthetic oil plant at Puertollano, the Cofrentes hydroelectric power station, dams on the rivers Júcar, Turia, Ebro and Castro, a sanatorium at Santander, a work and health centre in Madrid, the Reus-Tarragona railway, Orense junction, and part of the new line to Galicia.

Education.—Schools: primary (1947-48) 55,111, pupils 2,425,762 (1,212,921 girls), teachers 55,833 (30,030 women); secondary (1948-49) 119, pupils 212,210 (74,319 girls); training colleges for elementary teachers (1948-49), students 24,171 (17,575 women). Universities (1948-49) 12, students 49,980 (6,866 women), professors and lecturers 3,300. Illiteracy (1947): 20.8%.

Finance and Banking.—Budget: (1952-53 est.) revenue 22,208,000,000 pesetas, expenditure 22,477,000,000 pesetas. National debt (Sept. 1951) 58,195,000,000 pesetas. Currency circulation (June 1952) 35,100,000,000 pesetas. Bank deposits (March 1952) 43,600,000,000 pesetas. Gold reserve (June 1952) U.S. \$51,000,000. Monetary unit: peseta with an official exchange rate (Nov. 1952) of 30.66 pesetas to the pound and 10.95 pesetas to the U.S. dollar.

Foreign Trade.—(1951) Imports 1,306,500,000 pesetas, exports 1,523,500,000 pesetas. Main sources of imports (1950): Spanish colonies 24%; U.S. 13%; France 8%; Western Germany 7%. Main destinations of exports: Spanish colonies 24%; U.S. 15%; U.K. 14%; France 6%. Main imports (Jan.-June 1951): machinery, apparatus and vehicles 16.6%; food and drink 15.5%; chemicals and derivatives 10.6%; textiles 12.7%. Main exports: food and drink 54.7%; textiles 11.2%; minerals, earths and stones 8.4%; metals and metal goods, including gold and silver, 5.2%.

Transport and Communications.—Roads (1949): 68,651 mi., of which 51,202 mi. were macadamized. Licensed motor vehicles (Dec. 1950): cars c. 100,000, commercial 65,000. Railways (1950): 11,068 mi., of which 925 mi. were electrified; passenger-miles 4,422,000,000; freight, ton-miles 4,004,000,000; freight carried 25,000,000 metric tons. Shipping (merchant vessels of 100 gross tons and over, July 1951): 1,173; total tonnage 1,219,541. Air transport (1949): aircraft entered Spain 19,426; passengers 234,790; freight 3,576 tons; passengers leaving Spain 249,460; freight 4,070 tons. Telephones (1951): 667,639. Radio receiving sets (1949): 375,635.

Agriculture.—Main crops (metric tons, 1951): wheat 4,150,000; barley 1,800,000; oats 580,000; rye 618,000; maize 650,000; rice, paddy 325,000; sugar, raw value 357,000; potatoes 4,000,000; cotton, ginned (1950) 2,000; tobacco (1950) 15,000; peanuts (1950) 12,000; olives (1950) 860,000; olive oil 600,000; oranges and tangerines 1,071,000; lemons 60,000. Wine production (1950) 15,680,000 hl. Livestock: cattle (Dec. 1948) 4,000,000, horses (Dec. 1949) 600,000, asses (April 1948) 747,000, mules (April 1948) 1,079,000, pigs (April 1948) 2,668,000, sheep (Sept. 1950) 25,954,000, goats (April 1948) 4,222,000, chickens (Sept. 1950) 20,338,000. Meat production (1950) total 432,000 metric tons, of which beef and veal were 135,000 and pork 188,000. Wool production, clean basis (1951) 27,000 metric tons. Fisheries: total catch (1951) 569,500 metric tons.

Industry.—Fuel and power (1951): coal 11,328,000 metric tons; lignite 1,488,000 metric tons; manufactured gas 276,000,000 cu.m.; electricity 7,200,000,000 kw.hr. Raw materials (metric tons, 1951): iron ore, metal content 2,328,000; pig iron 668,400; steel ingots and castings 811,200;

copper, blister 6,400; lead, smelter 41,000; zinc, smelter 21,100. Manufactured goods (metric tons, 1951): cement 2,328,000; cotton yarn 52,300; wool yarn 10,200; rayon filament yarn 10,000; rayon staple fibre 10,100. New dwelling units completed (1951) 15,828. Index of industrial production (1948=100, 1951): 115.

Spanish-American Literature: see LATIN AMERICAN LITERATURE.

Spanish Colonial Empire. Under this heading are grouped the Spanish possessions in Africa. Their total area is approximately 134,715 sq.mi. and the total population (1951 est.) 1,597,000. Areas, popula-

Spanish Colonial Empire					
Country	Area (sq.mi.)	Population (1951 est.)	Capital	Status	Governor
Spanish Morocco					
Northern zone	7,592	1,200,000	Tetuán (pop., 1945, 93,658)	Protectorate	High commissioner: Lieut. Gen. Rafael García Valiño y Marcén Khalif (viceroy of the sultan of Morocco): Muley Hassan Ismael el Mehedi
Southern zone	10,039		Cabo Yubi	Protectorate	
Ifni territory	741	44,000	Ifni	Colony	
Ceuta, Melilla, Alhucemas, Chafarinas and Peñón de Velez	82	141,000	—	Administered as part of Spain	—
Spanish Sahara					
Rio de Oro	73,362	37,000	Villa Cisneros	Colony	—
Saguia el Hamra	32,047				
Spanish Guinea	10,852	175,000	Santa Isabel, on Fernando Po (pop., 1945, 17,000)	Colony	—
including Rio Muni, Fernando Po and four small islands					

tions, capital towns, status and governors of the territories are given in the table.

History.—In marked contrast to the deep political unrest and frequent public disturbances which agitated not only neighbouring colonial territories but the entire Moslem world from Tangier to Tehran, life remained normal in the various Spanish dependencies, where order was preserved without difficulty, throughout 1952. A Spanish Arabic scholar, Emilio García Gómez, and a Moorish general, Mohammed ben Mizzian ben Kassen, were members of the diplomatic mission which in April General Franco dispatched on its travels through the middle east with a broadcast speech, in Arabic and Spanish, that conveyed his most cordial greetings to the peoples of Islam, whose national resurgence, parallel to that of the Hispanic countries, he praised by contrast with "the decrepitude of other races." In answer to inquiries about Spanish policy in Morocco, Alberto Martín Artajo, the foreign minister, who led the mission, was able to imply that Spain desired nothing better than to grant its Moorish subjects their independence but that it was prevented from doing so as yet by its obligation to act in strict accordance with the French.

The Spaniards' overt encouragement of Moorish aspirations was galling to the French authorities, whose suspicions were aroused by the fact that rioting on the anniversary of the sultan's treaty with France was limited exclusively to the international and French zones.

Finance.—Spanish Morocco, budget (1947): balanced at 211,000,000 pesetas. Spanish Guinea, budget (1943): revenue 23,300,000 pesetas, expenditure 23,600,000 pesetas.

Foreign Trade.—All territories (1948): imports 578,400,000 gold pesetas, exports 206,400,000 gold pesetas. Ceuta and Melilla only (1949): imports 123,000,000 gold pesetas, exports 55,000,000 gold pesetas.

Transport and Communications.—Spanish Morocco (1947): roads 1,430 mi.; railways 140 mi. Shipping (1949): vessels entered, 120,000 net registered tons.

Spanish Literature. To the annual prizes, official and other, which figured so largely on the literary scene of 1952, there was added the stimulus of a poetry festival with resuscitated "Floral Games"; initiated in Madrid in March and intended as an annual event thereafter, it was copied in the provinces. Native poetic production, *e.g.*, Eloy Muñoz Martí, *Poesía a campo abierto*, and Alfonso Albalá, *Umbral de armonía*, was overshadowed by the many editions of Spanish-American poets, and *Texto sobre el tiempo* by the

Venezuelan José Ramón Medina and *Salvación del recuerdo* by the Colombian Eduardo Cote alike received awards. Paulina Crusat edited in Castilian translation an *Antología de poetas catalanes contemporáneos*. Arcadio de Larrea Palacín's *Concionero judío del norte de Marruecos*, vol. i., gave musical score as well as transcription of 50 new texts from the inexhaustible mine of traditional balladry. The novel was represented by Luis Romero's *La Noria*, Juan José Mira's *En la noche no hay caminos*, José Antonio Giménez-Arnau's *De pantalón largo* (a study of the psychology of adolescence), Carmen Laforet's *La Isla y los demonios* (her first since *Nada*, 1944) and, notably, Pedro de Lorenzo's *Una Conciencia de alquiler* (planned as the first of a series, *Los Descontentos*); and the short story by Julián Ayesta's *Helena o el mar de verano*. In the drama Jacinto Benavente continued, at 86, to furnish new plays of serious social purpose, notably *El Lebré del cielo*, after Francis Thompson's *Hound of Heaven*, and *Ha llegado don Juan*; José Suárez Carreño's *Condenados*, a rural tragedy in the vein of García Lorca, was this poet's first play; and Horacio Ruiz de la Fuente's *La Novia* was notable for its single character. In *Teatro español, 1950-51*, Federico Carlos Sáinz de Robles prefaced the text of six successful plays with a "criticism of the critics" and of the system of dramatic awards; an appendix listed plays produced in Madrid and the provinces.

Outstanding volumes in the essay—a field in which the national prize for 1951 was not awarded—were Angel Zúñiga's *Palabras del tiempo*, on the contemporary scene, and Guillermo Díaz-Plaja's *Poesía y realidad*. Three new reviews were launched in Madrid: *Poesía española*, *Alcalá* (university) and *Ateneo*. Vol. iii of the continuing *Homenaje* to Ramón Menéndez Pidal contained 30 further studies, while to the vast *Historia de España*, appearing under Pidal's general editorship, was added *España protohistórica*, by Martín Almagro and Antonio García y Bellido. Germán Bleiberg edited the encyclopaedic and authoritative two-volume *Diccionario de historia de España*. With vol. ix of *El Arte tipográfico en España durante el siglo xv* Francisco Vindel y Angulo completed his study of 964 incunabula. The poet Pedro Salinas and Amado Alonso, philologist and literary critic, both died in the United States, where they held university posts. Three comedies by Salinas, *La Cabeza de Medusa*, *La Estratosfera* and *La Isla del tesoro*, were published posthumously in Madrid. (W. C. AN.)

Sparkman, John (1899–), U.S. senator, was born on Dec. 20 near Hartselle, Ala., the son of a tenant farmer. He took his bachelor's degree from the University of Alabama, Tuscaloosa, in 1921 and received his law degree in 1923 and his master's degree in 1924 from the same institution. Admitted to the Alabama bar in 1925, he practised law at Huntsville, Ala., from 1925 to 1930, also teaching at Huntsville college from 1925 to 1928. In 1930-31 he was a U.S. commissioner at Huntsville. In 1936 he was elected to the U.S. house of representatives as a Democrat from the 8th Alabama district, and served in the 75th-79th congresses (1937-47); he was majority whip of the house in 1946. After the death of Sen. John H. Bankhead in 1946, Sparkman was elected to fill the unexpired term in the U.S. senate, and he was re-elected in 1948 for the full term 1949-55. In both house and senate he was a consistent supporter of the New Deal and the Fair Deal. However, his vote against the Fair Labor Standards act of 1938, his original vote for the Taft-Hartley act in 1947 and his firm opposition to civil rights legislation were notable deviations from the party line. On the latter issue in 1948 he opposed the nomination of Harry S. Truman as the Democratic presidential candidate.

Sparkman was a campaign manager for Sen. Richard B. Rus-

sell of Georgia in 1952 prior to the nomination of Adlai E. Stevenson as the Democratic candidate for president. Stevenson selected Sparkman as his running mate, and the latter was nominated for the vice-presidency by the convention at Chicago on July 26, 1952. The Stevenson-Sparkman ticket was defeated by a Republican landslide in the Nov. 4 elections.

Squash Racquets. Harry Conlon of Buffalo, N.Y., a member of the U.S. air force, gained national honours in 1952 by defeating G. Diehl Mateer, Jr., Philadelphia, Pa., in the annual championships at New Haven, Conn. Another five-game final resulted in victory for Harold Kaese, Boston, Mass., who took the veterans' crown by halting Joe Hahn, Detroit, Mich. Germain Glidden and Richard Remsen, New York stars, carried off the national doubles title at Greenwich, Conn., when they defeated James Ethridge, III, and Carl M. Badger, Greenwich. Philadelphia won United States team laurels.

Eddie Reid, Hartford, Conn., annexed the national professional title for the fourth time by halting Al Ramsay, Cleveland, O., at Cleveland. Charles W. Ufford, Jr., of Harvard university, captured the United States intercollegiate championship.

The western tourney at Cincinnati, O., proved a family affair for the Hahn brothers, Ed and Joe, of Detroit. Ed took the singles for the fifth year in a row by beating Harry Conlon. Joe won the senior division final by halting Col. E. N. Powell, Columbia, Mo. The team trophy was taken by Chicago when it defeated Cincinnati, 2-1. Henri Salaun, Hartford, Conn., successfully defended his Canadian crown and Canada annexed the Lapham international team trophy.

Margaret Howe, Boston, Mass., became the women's national champion when she conquered Mrs. Ann Dietrich Wetzel, Philadelphia, at Boston. Mrs. Wetzel teamed with Anne Reilly, Philadelphia, for doubles honours. Mrs. E. I. Beatty, Jr., Philadelphia, won the veterans' laurels. Women's competition was marked by the visit of a team of British stars, the trip being climaxed by the international matches for the Wolfe-Noel Challenge cup at Boston. The United States took the trophy for the first time since 1949, winning by 4-1. Margaret Howe, Mrs. Betty Howe Constable, Jane Austin and Mrs. H. L. G. Clement triumphed for the Americans and Sheila Speight gained the invaders' lone victory. (T. V. H.)

Stalin, Joseph Vissarionovich (1879–), Soviet prime minister, was born at Gori, Georgia, Transcaucasia, on Dec. 21. For his early career, see *Encyclopædia Britannica*. After Lenin's death (Jan. 21, 1924), Stalin's rise to pre-eminence in the party machine and state administration began. His position of dictator of the U.S.S.R. was unquestionable, although he did not hold state office until May 6, 1941, when he assumed the post of premier.

On July 19, 1941, after the German attack, he appointed himself also commander in chief and minister of the armed forces; in March 1943 he assumed the rank of marshal of the Soviet Union. During World War II he met the leaders of the Soviet Union's wartime allies at Tehran (Nov. 1943), Yalta (Feb. 1945) and Potsdam (July 1945). On March 3, 1947, he resigned as minister of the armed forces, retaining the post of premier. From Feb. 9, 1946, when he reviewed Soviet war achievements, Stalin made no public speeches and kept himself in the background. On Feb. 13, 1950, he attended at the Hotel Metropole, Moscow, a banquet given by Mao Tse-tung and this was understood to be the first time Stalin had dined out at a public place since 1923. On Feb. 16, 1951, he prophesied that if Great Britain and the United States rejected Chinese peace proposals "the war in Korea can end only in the defeat of the interventionists." On April 1, 1952, replying by cable to 50 U.S. newspapermen, he expressed the opinion that the possibility of another world war was no nearer than it had been two or three years before. On May 1 he attended the traditional parade in Moscow and on July 27 the Soviet air force display at Tushino. (See also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stamp Collecting: see PHILATELY.

Standards, National Bureau of. Established by act of congress, March 3, 1901, the national bureau of standards has basic responsibilities for research, development, testing, calibration, specifications and scientific services in physics, mathematics, chemistry, metallurgy and engineering. During 1952 it consisted of 17 scientific and technical divisions (electricity, optics and metrology, heat and power, atomic and radiation physics, chemistry, mechanics, organic and fibrous materials, metallurgy, mineral products, building technology, applied mathematics, electronics, radio propagation and 4 divisions concerned with ordnance), 3 offices (basic instrumentation, weights and measures and scientific publications) and 6 administrative divisions (accounting, personnel, administrative services, shops, supply and plant).

Several new laboratories were constructed in Washington, D.C.: a new ordnance laboratory was almost finished at the end of the year (sponsored by the department of the army) and a major addition to the electronic computer laboratory was erected (sponsored by the Atomic Energy commission). The Corona, Calif., laboratories, finished at the end of the preceding year, were in full operation on a variety of ordnance projects (principally for the navy) and special topics in electronics, computers and optics. Construction of a major cryogenic engineering laboratory for the bureau at Boulder, Colo., was completed by the Atomic Energy commission; full-scale operations were attained shortly after the middle of the year. Construction of the \$4,000,000 radio propagation laboratory was begun at Boulder in June, with completion scheduled for early 1954.

The major effort of the bureau was again devoted to military programs sponsored largely by the department of defense. The bulk of this activity was concerned with electronic ordnance of advanced types.

Significant progress was made in the bureau's broad electronic computer program. For a second year SEAC (National Bureau of Standards Eastern Automatic Computer) operated on a round-the-clock basis, seven days a week. SWAC (National Bureau of Standards Western Automatic Computer) at the bureau's Institute for Numerical Analysis in Los Angeles, Calif., was operated on a 40-hour-week basis. A wide variety of problems in physics, chemistry, mathematics and engineering were solved on the bureau's two operating computers. Research and development on computer components included studies of elec-

trostatic and ultrasonic memory storage devices, magnetic-tape input-output mechanisms having rapid access time, and a novel type of magnetic wire drive.

The work in atomic and nuclear physics included studies of radiation protection, development of radiation-detecting instruments, research on semiconductors and in solid state electronics, and development of new techniques in electron physics and mass spectrometry. A new rectifier, made by heating titanium in water vapour at 600° C., showed promise, particularly in its high-temperature characteristics. A new method was devised for measuring atomic masses precisely, based on the time of flight of particles passing through crossed electric and magnetic fields. A semiportable radioactive cobalt source, with related equipment, was developed for use in field calibration of radiation instruments. A 50,000,000-v. betatron was placed in operation, and studies of the properties of the energy were begun. Installation of the 180,000,000-v. synchrotron was completed; research on X-rays in this high range of energies was to begin in 1953.

Several standards of importance to science and technology were developed during the year. Colorimetric specifications for a set of colour standards for the petroleum industry were developed. A spectrophotometric standard for the ultra-violet region was devised. A master 24-sided polygon was constructed for calibration of master angle blocks. The calibration of four 3,000,000-lb. compression dynamometers extended the range of calibration of large testing machines which the bureau could undertake from 2,600,000 to 12,000,000 lb. From about 300 lines and bands, wave lengths for infra-red standards were determined to an accuracy of about 1 part in 250,000.

New instruments and techniques of measurement were devised and used. A new method of sensitometry provided a simple, rapid means of evaluating photographic papers with respect to log-exposure scale and contrast. The discovery that silver can be precipitated in metallic form from ammoniacal silver solutions by hydrogen peroxide made available a long-wanted laboratory method for the purification of silver and its preparation in a finely crystalline state. A method for preparing cobalt-free nickel salts provided for the first time nickel salts suitable as standards for measurement of magnetic susceptibility, for spectrochemical analysis and for developing test methods of nickel salts as reagent chemicals. A method was devised for freeing zirconium of common impurities and for preparing zirconium sulphate and oxide.

The variation in mutual inductance between two coils in proximity to a conducting surface was used as the principle of operation for a number of instruments. A noise-free instrument cable was developed in which spurious electrical signals, arising from mechanical motion of the cable, were reduced by a factor of 500 or more. Hot-wire anemometers for use in turbulence studies at transsonic and supersonic speeds were developed of rhodium-platinum alloys. A limit load gauge was devised which reveals whether structural components of aircraft in service have been stressed beyond safe limits. An ultrahigh centrifuge, capable of producing acceleration of 60,000 g on a 1-lb. weight, was completed; a second centrifuge provided 100 g on 100-lb. devices.

Studies of the properties of matter included the following: Viscosities of gases at temperatures in excess of 2,000° F. at about atmospheric pressure were measured. The relationship between the fatigue strength of basic materials and that of the materials in aircraft structures was made. The problem of salt-water intrusion from a tideless sea into a fresh-water channel flowing seaward, simulating a river mouth, was studied experimentally in the laboratory. Investigations of properties of simple glass-forming systems were extended to include alkali borates. Fundamental data were obtained of certain properties of re-

fractory ceramics with favourable nuclear properties. Experimental ceramics, designed to replace an unavailable grade of mica, were developed for electronic components. The nature of adherence of porcelain enamels to metals was examined.

More than 300,000 calibrations and tests were undertaken for the government and the nation. About 33,000 standard samples were prepared and distributed. Typical activities of this kind included the calibration of about 8,900 gauge blocks, radium determination of approximately 275 ores and sludges, calibration of 29,500 capacity-measuring devices and distribution of 1,300 radioactive standards.

Results of the bureau's work are available through three monthly periodicals (*Journal of Research*, *Technical News Bulletin* and *Basic Radio Propagation Predictions*) and a series of nonperiodical publications. An indexed list of publications (*Publications of the National Bureau of Standards*, circular 460) is available from the superintendent of documents, U.S. government printing office, Washington 25, D.C. (H. OD.)

Stars: see ASTRONOMY.

Stassen, Harold Edward (1907—), U.S. government official, was born on April 13 at West St. Paul, Minn. He received his bachelor's degree from the University of Minnesota, Minneapolis, in 1929, and his law degree there the same year. In 1930 he was elected county attorney, holding the post for eight years, then was elected governor of Minnesota on the Republican ticket in 1938; he was re-elected in 1940 for a second term. In 1943 he resigned the office to join the U.S. navy, where he served as flag officer to Adm. William F. Halsey, Jr.

Stassen was a candidate for the Republican nomination for president in 1944 and again in 1948, but lost on both occasions to Thomas E. Dewey. After the 1948 convention he accepted the presidency of the University of Pennsylvania, Philadelphia. On Nov. 3, 1951, he again won the Minnesota state Republican convention's endorsement for the 1952 presidential nomination. Although he campaigned actively at first for the 1952 nomination, he soon offered to share delegates with Gen. Dwight D. Eisenhower or to release them to the general. At the Republican convention in Chicago in July, it was Stassen's rapid switch of his Minnesota delegation to Eisenhower after the first roll call of states that helped assure the latter's nomination on the first ballot. On Nov. 21, 1952, Eisenhower named Stassen to be the new director of the Mutual Security agency.

Stevenson, Adlai Ewing (1900—), U.S. political figure, was born at Los Angeles, Calif., on Feb. 5. The grandfather for whom he was named served as vice-president under Grover Cleveland. He was educated at Choate school, Wallingford, Conn., and at Princeton university where he was graduated in 1922. He earned his law degree at Harvard and Northwestern universities, interrupting his education to spend a year as assistant managing editor of the *Bloomington Daily Pantagraph* (Ill.), which was owned by his family.

After a brief experience as a newspaper correspondent in Russia and Europe, he practised law in Chicago from 1927 to 1933,

and again from 1935 to 1941. In 1933-34 he served as special counsel in the department of agriculture, and as general counsel for the federal alcohol control administration. From 1941 to 1944 he was special assistant to Frank Knox, then secretary of the navy, handling racial and labour-management relations. Transferring to the state department, he served from 1945 to 1947 in various capacities with the U.S. delegation to the United Nations.

He began his political career in 1948, when he was elected governor of Illinois on the Democratic ticket. His administration was generally regarded as honest, efficient and economical. When speculation of him as a presidential prospect began in 1952, he issued a formal statement at Springfield on Jan. 7, saying that he could run for no office except governor. Although he persisted in this negative attitude, personal and political friends began a preconvention movement on his behalf. He gave them no co-operation, but at the Democratic convention in Chicago on July 25, Stevenson was nominated on the third ballot, with Senator John J. Sparkman of Alabama as his running mate.

During the campaign, Stevenson sensed a general discontent with the administration of Pres. Harry S. Truman, and he made a determined but only partially successful effort to disassociate himself from Truman. He established headquarters at Springfield, and picked personal friends as campaign manager and chairman of the Democratic national committee—Wilson Wyatt of Louisville, Ky., and Stephen A. Mitchell of Chicago, respectively.

Stevenson generally upheld the Roosevelt-Truman record on foreign and domestic questions, insisting that it had protected the peace and produced prosperity. His speeches had a wit, a biblical tone, a literary quality and an intellectual content rarely present in U.S. political oratory. But his unique strategy could not combat the voters' demand for a "change at Washington." On Nov. 4, he carried only 9 states as compared with 39 for Gen. Dwight D. Eisenhower. The electoral vote was 442 to 89, and the popular total was 33,927,549 for Eisenhower and 27,311,316 for Stevenson. (See also ELECTIONS, U.S.; POLITICAL PARTIES, U.S.) (R. TU.)

Stocks and Bonds. U.S. Stocks.—Measured by Standard and Poor's composite index of 90 stocks, as shown in Table I, U.S. common stock prices for the first three quarters of 1952 reached new highs in the bull market which began about the middle of 1949. The 90-stock index for this period showed a sharp increase in January, compared with the previous year end prices. In February a reaction occurred, which wiped out almost 75% of this increase. In June, however, another rise started, which continued through August, at which time stock prices were the highest for the preceding period extending back to 1930. In September the prices were somewhat lower. A broader average of common stock prices, the combined index of Standard and Poor's 480 stocks, shows much the same trend for the first seven months of 1952.

A comparison of the increase in common stock prices in the first nine months of 1952, as represented by the 90-stock price index, with the increase which took place in the corresponding 1951 period, shows that the 1952 increase was smaller when viewed in terms of percentages. The increase in 1951 from January to September was from 168.4 to 186.5, or somewhat more than 10%. The increase in 1952 for the same period was from 192.1 to 196.8, or a little more than 2.4%.

The number of shares traded on the various exchanges in the United States, as reported by the Securities and Exchange commission for the first six months of 1952, was about 22% less than for the same period in 1951. Expressed in terms of money value, the trading on all exchanges during the first half of 1952

Source: Standard and Poor's Trade and Securities, Current Statistics. Figures are an average for the month, based upon closing prices with 1926 used as base period.

was about 21% less than for the comparable 1951 period. This lower volume of trading continued during the third quarter of 1952, according to available figures showing trading on the New York Stock exchange.

On July 31, 1952, according to a compilation of the New York Stock exchange, there were 2,728,000,000 shares listed on the exchange, with a total market value of \$115,824,600,000 and a flat average price per share of \$48.65. Of the total value of all shares on July 31, United States stocks amounted to \$113,387,200,000 and foreign stocks were \$2,437,400,000. The total number of shares were distributed over 1,493 separate United States issues and 22 foreign issues.

Cash dividends, publicly reported, paid to all stockholders during the first seven months of 1952 totalled \$4,374,000,000. This figure compares with \$4,141,300,000 paid out to all stockholders over the same period in 1951.

As of the end of the third quarter of 1952 the following were considered to be favourable factors of fundamental importance in their effect on equity prices: (1) profits of the railroads and utilities, for the full year 1952, as measured by the rail and utility stocks included in Table I, were expected to be higher than for 1951; and profits for the full year on the 50 industrial stocks in Table I were expected to be not less than 5% under those in 1951; (2) cash dividend payments on stocks in 1952 were expected to be about the same as those in 1951; (3) the federal reserve board's index of production during the fourth quarter of 1952 was expected to exceed the post-World War II high of 223, established in April 1951; and (4) the possibility that the excess profits tax would lapse on its expiration date of June 30, 1953. On the unfavourable side, the following factors should be mentioned: (1) the possibility that defense spending had reached or soon would reach its peak; (2) the possibility of a decrease in expenditures for plant and equipment by business concerns; and (3) the possibility of a further tightening in the money market, thereby curtailing borrowing for business and stock market purposes.

U.S. Bonds.—United States government long-term bond prices, according to Table III, started to rise in Jan. 1952. The rise, which was moderate, continued until May, when prices began to ease. By the end of September most of the rise had been cancelled; and government long-term bonds were selling at prices only slightly higher than those which prevailed in January. Corporate bond prices with A1+ ratings, as shown in Table II, changed very little during the first seven months of 1952. An average of all listed domestic bond prices on the New York Stock exchange for the first seven months of 1952 shows practically no change in their prices.

Source: Standard and Poor's Weekly Corporate Bond Price Index.

Sales of bonds expressed in terms of market value (excluding United States government bonds), on all registered exchanges in the United States for the first seven months of 1952 amounted to \$390,340,000 compared with \$445,904,000 of sales for the same period in 1951. Bond sales for the full year 1951 were lower than those for 1950.

According to a compilation by the New York Stock exchange, the total par value of bonds listed on the exchange on July 31, 1952, amounted to \$101,871,449,000, with a market value of \$100,273,061,000. United States corporation bonds on the exchange on the same date amounted to \$18,517,717,000 par value, with a market value of \$17,602,319,000; company bonds of other countries, a par value of \$590,134,000 and a market value of \$508,085,000; United States government bonds (including state and municipal, etc.), a par value of \$80,998,383,000 and a market value of \$80,798,545,000; and foreign governments, a par value of \$1,315,215,000 and a market value of \$930,912,000. The total listed bonds of United States corporations were distributed over 634 issues of 310 issuers; United States government bonds over 62 issues of 3 issuers and foreign government bonds over 185 issues of 51 issuers.

As shown in Tables II and III, yields decreased somewhat for long-term United States government bonds from January to May, 1952. Thereafter they rose to a point approximating the yield in January. The yield for United States corporate A1+ bonds for this period remained very stable.

The spread between the yields of bonds and stocks narrowed in the first seven months of 1952, principally because the yield on stocks went down. The difference was still wide, however, compared with the years prior to World War II. In Jan. 1952 the average yield on A1+ corporate bonds was 2.86% and the average yield on 90 composite common stocks was 5.82%, a difference of 2.96 basis points. In September this difference had decreased to 2.86 basis points.

Source: Standard and Poor's Weekly Government Bond Price Index.

At the end of the third quarter of 1952 the following were considered to be unfavourable factors of fundamental importance in their effect on bond prices: (1) the recent issuance of large amounts of bonds for expansion purposes and the resulting congestion in the bond market; (2) the possibility of the issuance of huge amounts of government long-term bonds for refunding purposes; (3) the higher interest rates in most foreign countries; (4) the belief of many that the period of low interest rates ended in 1946 and that the rise in interest rates since then should be considered a part of a longer period of decreasing bond prices and rising interest rates; and (5) a probable decline in business profits over the next few years. On the favourable side should be mentioned: (1) the expansion of industry and the resulting need for large amounts of credit appeared to be past the peak; (2) consumer demand seemed to be easing, with less credit needed by manufacturers of consumer goods; and (3) high savings should continue to furnish high demand for bonds.

New York Stock Exchange.—Higher costs of operation, including higher taxes and threatened taxes, influenced many actions of the exchange in the first three quarters of 1952. On Jan. 21, the Securities and Exchange commission proposed that charges and fees be levied against those engaged in the selling of securities. The amounts proposed were \$50 for each financial house and \$10 for each officer, partner and employee so engaged. By October these charges had not been put into effect.

On Feb. 2, New York city announced it would ask the legislature for the right to increase the tax on gross financial business from 0.4% to 2%. Later the legislature approved an increase to 0.8%; and this was put into effect.

On June 30, the report on share ownership in the United States was released by the Brookings institution. The exchange helped materially in the promotion of this study. The report revealed that there were 6,490,000 share owners of publicly owned corporations in the United States, of which 1,300,000 became share owners in the last three years and 390,000 during 1951. The report also showed there were 41,510,000 individuals between the ages of 30-49 who owned no shares in any publicly owned corporations.

For the first quarter of 1952 the New York Stock exchange operated at a profit of \$72,776, compared with a profit of \$226,186 in the same quarter of 1951. For the six months ended June 30, 1952, the exchange operated at a profit of \$218,470, as compared with \$388,827 profit for the comparable 1951 period. In large part this reduction in profit was the result of

TRADING IN STOCKS on the New York Stock exchange: yearly range of prices and number of shares sold, exclusive of odd-lot and stopped sales

reduced trading volume, which in the first half of 1952 was 30% below the same period of 1951.

New Issues.—According to the Securities and Exchange commission, new securities offered for cash in the United States for the first seven months of 1952 totalled \$19,147,948,000. This total, divided according to type of issuer, was as follows: corporate issues, \$6,187,828,000 and noncorporate issues (bonds), \$12,960,119,000. This last figure in turn includes U.S. government and federal agency issues of \$10,260,296,000; state and municipal issues, \$2,574,374,000; foreign government issues, \$71,079,000; International Bank issues, \$49,250,000; and non-profit organization issues, \$5,150,000. The total of corporate issues (\$6,187,828,000) may be divided into bonds, \$4,839,817,000; preferred stock, \$417,543,000; and common stock, \$930,468,000. The total of all securities issued for the first seven months of 1952 (\$19,147,948,000) was almost as large as the total of \$21,264,507,000 for the full year 1951, and \$19,892,793,000 for all of 1950. The increase in issues of securities in 1952 as compared with the two preceding years was spread fairly evenly among the various classes mentioned above. (See also SECURITIES AND EXCHANGE COMMISSION.) (C. A. K.)

Great Britain.—The stock exchange was dominated throughout 1952 by a decision which had been taken in Nov. 1951. The newly elected Conservative government then introduced a new monetary policy which made it more difficult and more expensive for companies and individuals to borrow money from the banks. The basic purpose of this policy of making bank credit scarcer and more costly was to discourage unnecessary spending in Great Britain in order that manpower, material and productive capacity engaged in meeting home demands could be diverted in part to the satisfaction of export and defense demands. This general monetary policy was also reinforced by a program of extensive and severe import cuts. It was hoped that this policy would convert the enormous deficit in the country's balance of payments in the last few months of 1951 into a moderate surplus by the end of 1952. It was not until after the middle of the year, however, that it became evident that the policies of the new government were achieving the desired results. An important contributory factor to the general price decline was

the budget, presented in March. The chancellor then announced, first, that the bank rate would be raised steeply from $2\frac{1}{2}\%$ to 4% , and secondly, that a severe form of excess profits levy would be applied to company profits with effect from the beginning of the year. Prices of government securities and industrial equities continued to fall away and by the latter part of June had reached their lowest levels for several years.

After midsummer, however, a significant change for the better developed in the stock market. It was becoming apparent that import cuts were at last biting deeply and bringing considerable relief to the country's balance of payments. It was also evident that the improvement in Great Britain's terms of trade—the fall in import prices in relation to export prices—was considerably greater than had been expected. Finally, there were indications of a useful expansion in British invisible overseas earnings from banking, shipping, insurance and other sources. By the end of the summer it was becoming increasingly clear that Great Britain's external accounts had been brought roughly into balance and that there was no longer any immediate danger of a major financial and economic crisis.

As the earlier fall in the prices of government stocks and industrial shares had resulted in the yields on these securities rising to their highest levels for a long period, there was a considerable revival of investment demand, both from institutional investors and from public investors. At the end of June irredeemable government stocks were yielding upward of $4\frac{1}{2}\%$ and high-grade industrial ordinary shares were returning $6\frac{1}{4}\%$ – $6\frac{1}{2}\%$. Consequently throughout July, August and the early part of September there was a strong recovery in both groups of securities. This was checked during the autumn but was resumed again toward the end of the year under the stimulus of the continuing improvement in the country's balance of payments and the substantial additions to the gold and dollar reserves. The market recovery was also helped by signs that some of the depressed consumer goods industries, which had experienced a big reduction in demand late in 1951 and early in 1952, were beginning to enjoy a revival of trade.

For the important groups of shares of primary commodity producing companies, 1952 was a difficult and generally unpleasant year. Most commodities fell heavily in price from the peak points reached after the outbreak of the Korean war and producers of many of these materials found themselves faced with a serious decline in sales revenue and a rigid and intractable cost structure. Nor was 1952 a very brilliant year for holders of gold shares, which drifted lower with only an occasional spasmodic rally. The big increase in the gold price which followed the devaluation of sterling in Sept. 1949 had been very largely swallowed up by rising production costs. (W. W. Rr.)

Stomach and Intestines, Diseases of the.

Measurement of the acid produced by the stomach is an important procedure in the study of gastric diseases. Histamine, the substance used for this purpose, may cause disagreeable reactions. A substitute for histamine, chemically identified as 3-beta amino-ethyl pyrazole, proved to be equally powerful in stimulating the output of acid and yet was tolerated exceedingly well. The search for more effective drugs inhibiting stomach acidity in the treatment of peptic ulcer gained momentum. Prantal, like Banthine, did not appear to be very effective for this purpose when taken by mouth although it decreased the output of acid when given by injection. More potent compounds were synthesized, but none proved suitable for general clinical use. Additional reports emphasized the unfavourable influence of corticotropin (ACTH, adrenocorticotrophic hormone) and cortisone in ulcer patients, stimulating acid secretion and precipi-

tating the complications of haemorrhage or perforation.

The treatment of severe bleeding remained a serious problem. X-ray examination during the period of active haemorrhage improved the accuracy of diagnosis.

Surgery in peptic ulcer is reserved usually for obstruction, haemorrhage, perforation and for ulcers developing after previous operation. Many surgeons preferred the procedure of gastric resection, removing approximately three-fourths of the stomach. Several modifications in the technique of the operation were described. The risk of improved surgery was quite low.

Improved surgical skill and excellent pre- and post-operative care permitted the removal of more tumours of the stomach, with a decreasing immediate mortality rate. Replacement of the excised stomach by a "new stomach" fashioned from the large intestine was possible in some patients. Nevertheless, the early recognition of cancer of the stomach and of tumours elsewhere in the digestive tract remained a difficult problem, seriously limiting the possibility of surgical cure. In the search for gastric cancer, routine photofluorographic gastrointestinal examinations of 10,000 patients yielded only one tumour for every 476 examinations. The comparative infrequency of cancer diagnosis in this survey and the high cost of the study indicated the magnitude of the problem.

Intestines.—A sulfonamide compound, salazopyrin, was reportedly effective in some patients with chronic ulcerative colitis. Corticotropin (ACTH) and cortisone remained useful adjuncts in the treatment of the disease; the fundamental cause was not eliminated, however, and recurrences were frequent. These hormones appeared less helpful in chronic inflammation of the small intestine (regional enteritis). On the other hand, cortisone was effective in the management of nontropical sprue, a disorder characterized by the passage of bulky, fatty stools, severe loss of weight and weakness. Bowel function improved remarkably; the appetite increased and the patients gained weight and strength. The beneficial action of cortisone appeared attributable to more efficient intestinal absorption of fats or to improvement in the general bodily metabolism.

The antibiotic aureomycin was effective in the treatment of diffuse peritonitis. Aureomycin calcium caseinate caused much fewer episodes of nausea and vomiting than ordinary aureomycin. A new antibiotic, neomycin, and the combination of polymyxin with neomycin or bacitracin rapidly suppressed bacterial growth in the intestines.

The dangers of indiscriminate antibiotic therapy became increasingly evident. Many antibiotics inhibit normal bacterial growth in the bowel and permit the rapid multiplication of staphylococci, *Proteus*, *Pseudomonas* and other bacteria, moulds and yeastlike organisms that are not susceptible to the antibiotic being used for the primary disease. Antibiotics also may induce vitamin deficiencies; and they frequently act as direct irritants to the bowel. These various factors probably were responsible for the "antibiotic diarrhoea" occurring in many patients receiving antibiotics. The chief symptoms were abdominal cramps, diarrhoea and fever. The bowel wall occasionally was inflamed, congested and ulcerated. This complication at times was more distressing than the original illness. Superinfections with resistant bacteria and fungi also were observed during the use of antibiotics. A decrease in the numbers of red and white blood cells and the platelets in the blood constituted an even more serious complication, resulting in a few patients in aplastic anaemia and death. These observations again emphasized the need for care in the administration of antibiotics, restricting their application to diseases in which they are of established value, and avoiding their use in minor illnesses for which antibiotics are not necessary.

Several new treatments were developed for intestinal para-

sites. The antibiotics, neomycin and fumagillin, and the combination of bismuth glycolyl arsanilate and chloroquine diphosphate were recommended for amoebic infections of the bowel. Terramycin effectively eradicated pinworms; quinacrine hydrochloride (Atabrine) facilitated the expulsion of tapeworms.

Pancreas.—Increased attention was directed to the pancreas and its diseases, especially chronic recurrent pancreatitis. Severe abdominal pain and jaundice were common symptoms of this inflammatory condition. The use of alcohol not infrequently precipitated the onset of the disease. Banthine appeared to be helpful in the treatment of some patients.

The diagnosis of cancer of the pancreas remained exceedingly difficult. Increased amounts of antithrombin in the blood were noted in the relative early phase of cancer of the pancreas with jaundice, suggesting the possibility of earlier diagnosis.

Pancreatic fibrosis is a serious illness in children, characterized by the passage of many large foul stools, severe malnutrition and cough. Chronic inflammation of the lungs is the most frequent cause of death. Treatment heretofore had been very unsatisfactory. Terramycin or aureomycin proved to be useful adjuncts in the management of this disease.

Liver and Gall-Bladder.—Infectious hepatitis, a viral infection of the liver, commonly produces symptoms of fatigue, poor appetite, distaste for smoking and abdominal pain. The physical findings usually include jaundice and an enlarged tender liver. Prompt recognition of infectious hepatitis requires constant awareness of its possible presence and appropriate tests of liver function.

Three separate epidemics re-emphasized the ease with which infectious hepatitis may be transmitted. One outbreak involved student nurses in an orphanage for infants and young children. The disease was spread by the faecal-oral route. The infective agent was demonstrable in the faeces for periods of 5 to 15 mo. after the initial illness. Another epidemic apparently was transmitted by person-to-person contact and by contaminated drinking water obtained from a well. The third outbreak occurred among a group of soldiers several weeks after the cook preparing their food had contracted the disease; circumstances strongly suggested contaminated food as the source of the infection.

Careful history, physical examination and laboratory tests may not disclose the cause of an enlarged liver or jaundice or both. The correct diagnosis in such patients was facilitated by the microscopic study of a small piece of liver tissue removed by a special needle. In expert hands, the procedure was relatively simple. These observations confirmed earlier studies of the problem. In the treatment of cirrhosis of the liver, emphasis again was directed to the importance of an adequate intake of protein and carbohydrate, fortified with intravenous injection of glucose. Choline or methionine is indicated in acutely ill patients unable to eat sufficient amounts of food. The use of alcohol must be discontinued.

A new radio-opaque material, telepaque, improved the visualization of the gall-bladder by X-ray and caused fewer reactions than previous dyes. The use of telepaque consequently received extensive trial in the diagnosis of gall-bladder disease. (See also MEDICINE.)

Strikes. In 1951 there were 4,737 strikes in the United States, a decrease of 106 from the 1950 total of 4,843. Further, the number of workers involved (2,191,500) and the number of idle man-days (22,910,000) in 1951 were considerably less than in the previous year, as shown in Table I.

The number of strikes in the first six months of 1952 was greater than the number of strikes for the corresponding period in 1951. There was also a great increase in the number of workers involved in strikes in the first six months of 1952 when compared with the same period of the previous year. In the same six-month period of 1952 the number of idle man-days rose to 30,720,000, which was approximately three times the corresponding figure for 1951. This increase in strikes, number of workers involved and idle man-days was the result of the steel strike, which began on June 2, 1952, and ended July 25, 1952.

These statistics published by the U.S. bureau of labour statistics included all known work stoppages arising from labour-management disputes that continued for at least one full day or shift and involved six or more workers. The data on man-days idle and workers involved covered all workers made idle in establishments directly involved in a stoppage and not those em-

Table I.—United States: Number of Strikes Beginning in the Year, Workers Involved and Man-days Lost

Year	Number of strikes	Number workers involved	Man-days idle during year	Per cent of estimated work time
1935-39 (average)	2,862	1,130,000	16,900,000	0.27
1946	4,985	4,600,000	116,000,000	1.43
1947	3,693	2,170,000	34,600,000	.41
1948	3,419	1,960,000	34,100,000	.37
1949	3,606	3,030,000	50,500,000	.59
1950	4,843	2,410,000	38,800,000	.44
1951	4,737	2,191,500	22,910,000	.21

*A stoppage of apprentices which began in March 1952 involved workers in several industries, but was counted as only one stoppage in the total for all industries taken together.

†Some workers, largely in the coal mining industry, were involved in more than one stoppage and are counted more than twice in the totals. The net number of individuals involved in coal mining stoppages was 95,000 in the 1952 period and 65,000 in the corresponding 1951 period. For all industries combined the corresponding net totals were approximately 210,000 and 220,000.

‡Fewer than 500.

§Fewer than 50.

DESERTED STEEL MILL YARDS in South Chicago, Ill., at the beginning of a strike by about 650,000 U.S. steel workers (C.I.O.) in June 1952

ployees made idle through material or service shortages incurred by such stoppages.

Work stoppages arising from industrial disputes in Great Britain for the first seven months of 1952 and 1951 are indicated in Table II. As in 1950 and 1951, the majority of strikes in the first seven months of 1952 arose in coal mining, with 686 strikes through July 1952—the total number of work stoppages having been 1,005 during this period. The number of workers involved in coal mining strikes and the number of working days lost was also larger for the first seven months of 1952, compared with the same period in 1951. Other industries with a relatively large number of strikes were building and contracting with 59 stoppages, engineering with 43, vehicles with 34, shipbuilding and repairing with 39 and transport with 34. Although the number of strikes in any one of these industries was less than 10% of the number of stoppages in mining for the 1952 period under consideration, the number of working days lost in the vehicles group was 50% greater than the number lost in mining, and the number of working days lost in engineering was about 60% of the number lost in mining.

Wage disputes were the predominant cause of industrial stoppages in Great Britain for the first seven months of 1952. The major share of these wage disputes was not for wage increases, but was concerned with other wage issues. Disputes over the employment of particular classes or persons, and other

Table IV.—Frequency and Size of Labour Disputes in Great Britain: First Seven Months of 1952 and Corresponding Months in 1951

Month	Strikes in progress		Number of working people involved		Number of working days lost	
	1952	1951	1952	1951	1952	1951
January	122	135	26,300	23,700	80,000	77,000
February	156	143	30,600	57,300	75,000	339,000
March	162	156	42,500	36,800	288,000	145,000
April	164	192	36,500	46,000	80,000	152,000

*Figures for July 1952 are subject to revision.
Source: Ministry of Labour Gazette (London).

working arrangements, were also major causes of work stoppages.

Comparative figures for the first seven months of 1951 and 1952 showed a larger number of strikes in progress in February, March, May and July of 1952. As Table IV indicates, however, the number of working people involved and number of working days lost did not necessarily increase (decrease) when the number of stoppages increased (decreased).

In Canada in the first six months of 1952 there were two fewer strikes and lockouts than for the corresponding period of 1951. However, the number of workers involved in industrial disputes in the 1952 period was more than twice the number involved in the corresponding 1951 period. Further the number of working days lost in the first six months of 1952 was more than

Table III.—Analysis of Principal Causes of Industrial Disputes in Great Britain: First Seven Months of 1952

Principal causes	Number of stoppages begun during 1952	Number of workers directly involved

Sugar. The consumption of sugar per capita in the United States was estimated as high as 95 lb. in 1952, a little less than in 1951 and less than average.

The 1952 domestic crop of sugar cane for sugar and seed was reduced by dry weather, but the two producing states had above average crops, and that of Louisiana was sharply above the small crop of 1951. Sugar-beet production, much of it under irrigation in the western half of the U.S., was indicated as 10,334,000 tons, compared with 10,485,000 tons in 1951 and 10,013,000-ton average for 1941-50. The indicated average yield of 15.2 tons per acre, the same as in 1951, was 2 tons above average for 1941-50.

Sugar cane for syrup and sorghum cane for molasses were adversely affected by summer drought in their major areas of production and declined below the low levels of recent years. Maple syrup production in 1952, mostly in Vermont and New York, was estimated at 1,603,000 gal. from 7,012,000 trees tapped; 189,000 lb. of sugar were also made. Both products were less abundant than in 1951 and much below the 1941-50 average. Honey in 1952 was an average crop, except in drought areas. Colonies of bees continued to decline as in most years since World War II. The support price was increased to 70% of parity, about 11½ cents per pound for extracted honey.

Consumption of sugar in the U.S. in 1952 was initially estimated in late 1951 and the quota set under the law at 7,700,000 tons, near the lower levels of the fluctuating estimates of 1951 consumption. However, in Oct. 1952 the quota was revised upward by 100,000 tons. Deliveries for the calendar year 1952 through early October amounted to about 6,550,000 tons, a rate which was expected to call for nearly 8,000,000 tons for the year.

The world centrifugal sugar crop of 1951-52 was a record one of about 38,200,000 short tons, raw value, 4% more than in the

previous year and one-third more than pre-World War II. The beet-sugar total, 14,093,000 tons, was moderately less than in the previous year, but above the 11,777,000 tons prewar average. Cane sugar set a new record, 24,102,000 tons, as compared with 21,792,000 tons in the previous year and only 17,101,000 tons prewar. The extra production to make the record possible came largely from Cuba, with 1,600,000 tons more than the year before. The 7,900,000 tons (previous record 6,675,000 tons in 1947-48) resulted from a favourable combination of larger acreage and high yields. Asia also increased production, by about 600,000 tons. Europe, with much of the beet-sugar production, accounted for much of the decrease, primarily because of unfavourable weather and some disease damage to the crop.

In addition there was a production of about 6,228,000 tons of locally used unrefined or semirefined noncentrifugal sugar. This was a large crop, compared with 6,108,000 tons the previous year, and slightly more than 5,000,000 tons prewar.

Preliminary evidence suggested that the 1952-53 world sugar crop might set a new record. The world's sugar beet crop harvested late in 1952 was 100,416,000 tons, compared with 100,920,000 tons in 1951 and 82,071,000 tons prewar. The total acreage planted to sugar beets in 1952 was larger than in 1951, but adverse crop conditions on the European continent lowered expected yields somewhat. Clearly, much would depend on whether Cuba restricted the 1952-53 grind, as seemed likely. One report indicated a possible restriction to a production of 5,000,000 tons in 1952-53.

In any case, Cuba had contributed heavily to a world surplus estimated at 2,385,000 tons or more. Of that amount Cuba set aside 1,750,000 tons in a stabilization reserve to be liquidated over a five-year period. It was suggested to the International Sugar council that a new agreement should be negotiated to replace that of 1937, under which quotas had not been enforced since World War II. A special committee was reported to have prepared a draft of a new agreement which was still being studied by the council as late as Sept. 1952, with the possibility that the council might ask the United Nations to convene a conference on sugar early in 1953.

Meanwhile, sugar price levels, primarily because of quotas, continued comparatively high in the face of surplus. No particular decline was indicated as likely with retail prices in the U.S. apparently firmly established at about 10 cents per pound. In October the no. 4 world raw sugar futures contract was traded below 4 cents per pound. Rationing of sugar continued in the United Kingdom because of the scarcity of dollars. Export controls on sugar and inedible molasses produced in the U.S. or any of its possessions were ended in July 1952, having been established in Oct. 1950. About 14,209,423 tons of centrifugal sugar entered world trade in 1951, slightly less than in the previous year. (J. K. R.)

Suicide Statistics.

The provisional death rate from suicide in the United States during the first six months of 1952 was 10.4 per 100,000 population, the rate for the same period of 1951 having been 10.5. Within the United States, the suicide rates per 100,000 for the first six months of 1952 were: northeastern states, 8.7; southern states, 8.8; north central states, 10.4; and western states, 17.6. The estimated number of suicides for the whole country during 1951 was 15,940, with a rate of 10.4 per 100,000 population. In the same year, England and Wales recorded 4,469 and a rate of 10.2 per 100,000 population. In 1950 Canada had a rate of 7.6. The European population of New Zealand in 1949 had a rate of 9.7, and for Australia the rate was 9.8.

In 1949, the latest year of complete record for the United States, of a total of 16,992 deaths from suicide and self-in-

licted injury, the numbers for the specific means were: poisoning by analgesic and soporific substances (mostly barbiturates), 805; poisoning by other solid and liquid substances, 1,044; poisoning by gases in domestic use, 1,118; poisoning by motor vehicle exhaust and other gases, 867; hanging and strangulation, 3,641; drowning, 768; firearms and explosives, 7,215; cutting or piercing instruments, 634; jumping from high places, 553; all other and unspecified means, 347. The suicide rate per 100,000 according to race and sex were: white males, 19.2; white females, 5.5; nonwhite males, 7.0; and nonwhite females, 1.5. Among white males the suicide rate rose with advance in age to a peak of 55.4 per 100,000 at ages 65-69, with a resumption in the rise after age 75. (M. Sp.)

Sulphur. More than 90% of the world output of sulphur originates in the United States, and the bulk of the remainder comes from Italy and Japan.

United States.—For the past ten years demand for sulphur had exceeded output, and mine shipments were maintained by drawing heavily on stocks that had been accumulated in earlier years.

The trend of the industry since 1946 is shown in the following table, as reported by the U.S. bureau of mines.

Data on Sulphur Industry in the United States

	(In thousands of short tons)					
	1946	1947	1948	1949	1950	1951
Production (native)	4,322.8	4,974.1	5,453.5	5,314.4	5,815.2	5,911.6
Shipments	4,623.6	5,020.7	5,576.4	5,364.0	6,165.3	6,165.3
Exports (crude)	1,395.3	1,511.5	1,451.0	1,602.6	1,613.9	1,442.3
Available supply	3,228.3	3,509.2	4,125.4	3,761.4	4,551.4	4,723.0
Consumption	3,256	3,965	4,144.0	3,920.0	4,553.9	?
Stocks (producers')	4,221	3,771.5	3,612.0	3,471.2	2,973.0	3,177.9
By-product recovery	?	48.6	49.7	63.6	159.6	?

Under the pressure of a constantly growing demand, which was accentuated by requirements for the defense program, exploratory work had increased the reserves, and development of expanded production was under way but, in spite of this, shipments were cut back in 1951, to avoid further depletion of stocks.

The production rate in the first nine months of 1952 was slightly above that of 1951; 4,484,067 short tons were produced and 4,308,696 tons were shipped. (G. A. Ro.)

Sumatra: see INDONESIA.

Summerfield, Arthur E (Ilsworth) (1899—), U.S. government official, was born at Pinconning, Mich., on March 17. He worked in various automobile plants and in real estate, and in 1924 became distributor in Flint, Mich., for the Pure Oil company.

In 1929 he founded the Summerfield Chevrolet company and in 1938 became president of the Bryant Properties corporation. He was a member of the board of directors of the American Motorists Insurance company and the Lumbermen's Mutual Insurance company. He became active in Republican politics during Wendell Willkie's campaign for the presidency in 1940. In 1943 he was appointed finance director of the Republican state central committee, and in 1944 he was elected committeeman from Michigan at the Republican national convention. He sponsored a movement in 1946 to draft Sen. Arthur H. Vandenberg for the presidential nomination. Summerfield was appointed to the chairmanship of the Republican strategy committee in July 1949.

After Summerfield had been instrumental in swinging the presidential nomination to Dwight D. Eisenhower at the Republican national convention in July 1952, he was elected chairman of the Republican national committee. On Nov. 25 President-elect Eisenhower selected Summerfield to serve as postmaster general in the coming administration.

Support Prices: see AGRICULTURE.

Supreme Court of the United States. The annual term of the court began Oct. 1, 1951, and ended June 9, 1952. Charles Elmore Cropley, clerk of the court for the past 25 years, died June 17, 1952.

"DOWN TO SIZE," a 1952 cartoon by Pratt of the McClatchy Newspapers

The business of the court insofar as statistics are concerned paralleled closely that of the preceding term, 1,922 cases being disposed of as compared with 1,216. Eight fewer signed majority opinions were rendered, 83 as against 91 during the previous term. Dissenting opinions increased from 54 to 68. All but 13 of the 1,922 opinions dealt with matters in which the federal or state governments were involved. As had been the situation in recent years, criminal cases outnumbered any other category.

Members of the Court.—The United States supreme court in 1952 was composed of the following members (dates indicate year appointment was confirmed by the senate): chief justice, Frederick M. Vinson (1946); associate justices, Hugo L. Black (1937), Stanley Reed (1938), Felix Frankfurter (1939), William O. Douglas (1939), Robert H. Jackson (1941), Harold H. Burton (1945), Thomas C. Clark (1949) and Sherman Minton (1949). (See also LAW.) (H. B. Wv.)

Surgery. The causal relationship between tobacco and cancer of the lung was demonstrated by O. Gsell and A. Ochsner and his associates. Gsell showed that in a series of men with cancer of the bronchus, 87% were heavy to very heavy smokers and only 2% were nonsmokers. He concluded that the more an individual smokes the greater chance he has of developing a cancer of the lung, and that if individuals 45 years of age and older smoke 25 or more cigarettes daily, they have 50 times more chance of developing a cancer of the lung than do nonsmokers. Ochsner and his associates showed a definite parallelism between the sale of cigarettes in the United States and the increased incidence of cancer of the bronchus.

HEART OPERATION being telecast to groups of doctors on a closed TV circuit in Dec. 1951. The Columbia Broadcasting system claimed this to be the first coast-to-coast broadcast of colour television

Whereas in 1920 cancer of the bronchus represented 1.1% of all cancers and in 1930, 2.2%, in 1948 it represented 8.3% of all cancers.

In order to prevent death resulting from clotting in the veins, associated with infection of the pelvis, and following childbirth in which the clot is softened by the infection, C. G. Collins *et al.* recommend ligation of the vena cava, which is the large vein draining the lower extremities and the pelvis, and the ovarian veins. Previously this condition carried a high mortality rate, approximately 80%, but in a series of 70 cases who were operated upon, 62 (89%) survived and 8 (11%) died. Although it may seem undesirable to tie off all the large veins, it was done as a lifesaving procedure, and in spite of the fact that the course of the major vein was interrupted, the end results as far as circulation was concerned were good.

In order to stimulate respiration in an individual with respiratory paralysis, S. J. Sarnoff and others used electrical stimulation applied to the phrenic nerve, which controls respiration. By means of an electrode applied to the skin overlying the nerve in the neck, it is possible to maintain normal respiration until it occurs spontaneously.

Arthur Vineberg treated coronary thrombosis by transplanting an artery of the chest (internal mammary artery) into the wall of the heart. In this way, additional blood is supplied to the heart muscle, and of four patients operated upon by this technique, three progressed nicely. E. R. Maurer successfully removed a fatty tumour of the heart.

V. A. Cooley and M. E. DeBakey reported several cases in which an aneurysm of the aorta was removed and the lumen of the large artery, leaving the heart, maintained by suturing it. This procedure is particularly applicable in cases in which the aneurysm is the result of syphilitic disease of the aorta, and is less efficacious in the patient in whom the aneurysm is caused by hardening of the artery.

H. B. Shumacker showed that removal of the sympathetic nerves is of value in the treatment of frostbite. In 20 patients with frostbite, sympathectomies were done. In all, there was evidence of diminution in circulation, but in each instance the operation greatly relieved the patient. Shumacker believed that sympathectomy, besides relieving pain and sensitivity, hastens the healing process.

In order to prevent swelling of the arm following removal of

a breast for cancer, N. Treves changed the attachment of the large muscle extending from the chest to the arm. In this way, the space left under the arm following the operation was filled and the pressure on the large vein in the armpit was prevented.

Putting the diseased bowel at rest by making an external opening in the small intestine in patients with ulcerative colitis had been the method of choice when symptoms were severe. It was recently emphasized that removal of the diseased colon is better. C. G. Ripstein *et al.* showed that in 72 cases in which the colon was removed there were only 3 deaths (4.1%). E. S. Judd *et al.* emphasized that patients with cancer of the colon a short distance above the rectum should be treated by removal of the rectum. The results reported by Judd showed that to attempt to save the rectal sphincter is hazardous and that if an incomplete operation is done in order to save a part of the rectum, the incidence of recurrence of the cancer is higher the closer the cancer is to the rectal opening. The five-year survival rates in patients in whom the cancer was within 10 cm. of the anus was 57.6%. In those in whom it was located between 11 and 15 cm. it was 64.2% and in those in whom it was between 16 and 20 cm. the survival rate was 73.8%. F. A. Collier *et al.* also emphasized the importance of the radical procedure in cases of cancer of the rectum.

In order to increase the salvage rate in the treatment of cancer, A. G. James, R. D. Williams and J. L. Morton advocated the use of radioactive cobalt. If the radioactive cobalt is applied in flexible nylon tubing, the flexibility of the tubing permits more intimate contact of the radioactive substance than would be possible from other methods of treatment, and a better effect on the tumour is obtained.

P. T. DeCamp *et al.* showed that delay in surgical treatment of acute inflammation of the gall bladder greatly increases the risk. The disease is more serious in older people. In patients who have an obstruction of the ducts leading from the liver to the intestine and who have jaundice and infection as a result of this obstruction, M. A. Hayes and F. A. Collier recommended uncovering a remnant of embryologic duct in the liver which is found in the base of the gall bladder. If a satisfactory duct can be found, they suggest anastomosis of this to a loop of intestine, in this way short-circuiting the bile from the liver into the intestine. They did this successfully in two patients.

Cancer of the pancreas which had extended beyond the pancreas and involved the portal vein (the large vein extending from the intestine and liver) had been considered inoperable. In two such cases, C. G. Charles *et al.* performed preliminary ligation of the portal vein and later removed the diseased vein together with the pancreas.

In patients in whom it is necessary to remove portions of the large vessels of the chest, such as the aorta, P. W. Schafer and C. A. Hardin suggested the use of temporary plastic shunts to permit the blood to flow around the site of the operative procedure and in this way maintain circulation while the operation is being done. (See also MEDICINE; PHYSIOLOGY.)

Surinam (DUTCH GUIANA). Surinam, lying between French Guiana and British Guiana in northeastern South America, has an area of 55,212 sq.mi. It consists of a plain along the sea, with very little elevation and much swamp, which seldom attains a width of 100 mi., and a plateau rich in timber and minerals. The population, estimated in 1951 at 223,000, lives mainly on the coastal plain. Those born in Europe aggregate between 3,000 and 5,000; more than 50,000 were born in India, or are descended from those born there; about 35,000 are of Javanese origin; 20,000 are Afro-American; and more than 85,000 are indigenous or are partly indigenous, and partly of European, African, Asiatic or Indonesian descent. The capital is Paramaribo (pop. est. in 1951, 78,000). No other town has more than 5,000 inhabitants. All citizens of Surinam are Netherlandish subjects. The official language is Netherlandish, but other languages and dialects are widely used. The governor, appointed by the crown, was J. Klaasesz during 1952. The cabinet was headed by J. A. E. Buiskool.

History.—During 1952 extensive studies were undertaken for the purpose of carrying out the long-range program of development proposed by the International Bank for Reconstruction and Development. Concrete results of these studies were not expected before the beginning of 1953. The difficulty in working out a legislative program acceptable to foreign investors as well as to the majority of the legislative council became more apparent as the year proceeded.

Foreign trade continued to increase slightly during 1952. Connection by air, as well as by maritime facilities with the Netherlands, was improved by new services, and migration of Netherlanders to Surinam was encouraged by credit and other assistance. (See also NETHERLANDS ANTILLES.) (C. E. Mc.)

Education.—On Jan. 1, 1951, there were 120 elementary schools with 31,000 pupils and 783 teachers, 6 higher elementary schools with 2,250 pupils and 90 teachers, 1 secondary school with 81 students, 1 normal school with 48 students and 1 technical school with 99 students. There was also a law college and a medical college.

Finance.—The monetary unit is the Surinam guilder, valued at \$0.530264 U.S. currency, official rate, in 1952. The 1951 budget estimated expenditure at 27,863,000 guilders and revenue at 27,895,000 guilders.

Trade and Communications.—Exports in 1951 totalled 39,708,758 guilders; imports were 45,833,093 guilders. Principal customers were the U.S. (76%) and the Netherlands (6%); the chief suppliers were also the U.S. (37%) and the Netherlands (29%). Important exports included bauxite (about 70%), rice, citrus fruit, timber, gold, balata and coffee.

Internal transportation is largely by water; in 1951 there were 83 mi. of railway and about 250 mi. of roads. Motor vehicles at the end of 1950 included 1,096 automobiles, 499 trucks and 115 buses. In 1948 there were 1,505 telephones and 1,500 mi. of wire.

Production.—The major economic activity is the extraction of bauxite, most of which is exported to the U.S. Production figures in 1951 included bauxite 2,715,195 metric tons; gold 6,494 troy ounces; and balata 272 tons. Rice, sugar and coffee were also produced. There were 38,000 cattle in 1950. (J. W. Mw.)

Sweden. A democratic monarchy of northern Europe. Area: 173,390 sq.mi.; pop.: (Dec. 1950) 7,047,000; (1951 est.) 7,073,000. Capital: Stockholm (pop. Jan. 1, 1951) 745,936. Other principal cities (pop. Jan. 1, 1951) were Göteborg 353,991; Malmö 192,498; Norrköping 84,939; Hälsingborg 71,718; Örebro 66,548; Uppsala 63,072. Religion: Lutheran Christian. Ruler in 1952: King Gustav VI Adolf. Prime minister in 1952: Tage Erlander.

History.—In 1952 the Swedes were prosperous, but they lived through a series of crises. Repeated cases of espionage were

SWEDISH air force flying boat, shot down by two soviet MIG-15 jet fighter planes over the Baltic sea, June 16, 1952, while searching for a missing training plane. Crew members of the flying boat are shown in rubber lifeboats before they were picked up by a German freighter

capped in the spring by the discovery of a major ring of spies operating in the north of Sweden, and over a period of ten years selling vital information on the northern defense system to the U.S.S.R. The leader of the group was Fritiof Enbom; both he and his principal agent, Hugo Gjerswold, were sentenced to life imprisonment at hard labour. Enbom's younger brother Martin was given seven years, his girl friend Lilian Ceder eight months, Fingal Larsson five years, and Arthur Karlsson twenty months. The pay for Enbom appeared to have been only \$2,000; the motivation was Communist sympathy and hatred of Swedish society. The treachery of this group affected Sweden more deeply than did Polish and soviet officers caught in similar activities.

Tense relations with the U.S.S.R. were dramatized on June 13 when a Swedish training plane disappeared over the Baltic sea. Three days later a Catalina flying boat, searching for the lost plane, was shot down by two MIG-15 planes. In this case the crew radioed a report of the attack as it started, and the men were fortunate to be picked up quickly by a German steamer. The eight men on the first plane evidently went to their graves with the plane; it was located later 60 ft. below the surface of the sea. Both planes were well outside the 12-mi. limit claimed by the U.S.S.R. along its Baltic coasts. Sharp notes from Stockholm to Moscow elicited only the reply that the second plane had been shot down because it had violated the Soviet border. Sweden admitted that some days earlier one plane had accidentally transgressed the boundary, but insisted that this one had not. A later Swedish note reminded the Russians that they, too, had on several occasions flown over Swedish territory. Notes continued, with the Russians elaborating their charges against Sweden as late as September. Sweden held its ground, and declared its right and intentions to use the international waters of the Baltic—it was not a Russian sea.

Economic problems were serious, though far from desperate. The rapid rise in the price of pulp was halted in February by the English and French decision to pay only a set price, about 20% lower than the existing market figure. This buyers' ultimatum meant millions of kronor less for Sweden's most important export. Meantime inflation continued, and by mid-year the cost-of-living index was up 25% over two years previously. The associations of employers and employees agreed in February to

Riksdag—Second Chamber, 1952

Party	1948		1952	
	Votes	Seats	Votes	Seats
Conservatives (Höger)	478,786	23	538,484	31
Liberals (Folkparti)	882,437	57	929,829	59
Farmers (Bondeförbund)	480,421	30	405,910	25
Social Democrats	1,789,459	112	1,739,227	110
Communists	244,826	8	167,295	5

further collective wage increases of 10.2% (an increase of 1.7% over an agreement reached only a few weeks earlier).

Against this background the national elections for the second chamber of the *riksdag* were held on Sept. 21. The Social Democratic-Farmers coalition was charged with responsibility for inflation and for maintenance of unnecessarily high taxes. Foreign policy was barely mentioned, and in general the campaign brought forth no sharply defined issues. The balloting brought out only 77% of the voters, as compared to 82% at the previous election. The results, however, were more noteworthy than the campaign. The Farmers party, which had joined in the government with the Social Democrats in October 1951, lost heavily; the Social Democrats themselves lost slightly; the liberal Folk party and the Conservatives gained considerably; and the Communists lost less than expected, considering the state of the world and Sweden's position therein. The trend to the right was particularly significant in the larger cities.

The coalition government remained in power, but prophets predicted a future withdrawal of the Farmers, and at least the possibility of a bourgeois government four years later.

(F. D. S.)

Education.—Schools (1951): elementary 28,850, pupils 650,200, teachers 29,700; secondary 390, pupils 143,179, teachers 9,632; technical secondary, pupils 3,790. Teachers training colleges 29, students 6,184, professors and lecturers 1,051. Universities 4 and institutions of higher education 13, students 17,634, professors 448.

Finance and Banking.—Budget: (1951-52 actual) revenue 7,507,000,000 kronor, expenditure 6,423,000,000 kronor; (1952-53 est.) revenue 8,391,000,000 kronor, expenditure 7,220,000,000 kronor. National debt (June 30, 1952): 12,329,000,000 kronor. Currency circulation (Sept. 1952): 4,158,000,000 kronor. Gold reserve (Sept. 1952): 1,043,000,000 kronor. Deposit money (June 1952): 18,450,000,000 kronor. Monetary unit: krona (pl. kronor) with an exchange rate (Dec. 1952) of 14.50 kronor to the pound sterling and 5.18 kronor to the U.S. dollar.

Foreign Trade.—(1951) Imports 9,189,000,000 kronor, exports 9,170,000,000 kronor. Main sources of imports (1951): U.K. 16%; Germany 14%; U.S. 9%; Belgium-Luxembourg 6%. Main destinations of exports: U.K. 19%; Germany 11%; Norway 6%; France 6%. Principal imports: coal, petroleum and products 20%; textile fibres and manufactures 17%; machinery and vehicles 16%; base metals and manufactures 12%. Principal exports: wood pulp 28%; machinery and vehicles 16%; paper and manufactures 14%; wood and manufactures 12%.

Transport and Communications.—Roads (1952): 56,200 mi. Motor vehicles licensed (Jan. 1952): cars and buses 320,876, trucks 89,486. Railways (1952): 10,314 mi., passenger traffic, state railways (1951) 4,045,000,000

passenger miles; freight traffic (1951) 5,800,000,000 ton miles. Shipping (July 1951): merchant vessels 1,251; total tonnage 2,115,526 gross. Scheduled air transport (1951): miles flown 7,388,000; passenger miles 160,670,000; cargo net ton-miles 3,583,000. Telephone subscribers (1951): 1,685,200. Radio receiving set licences (1952): 2,205,000.

Agriculture.—Main crops (metric tons, 1952 est.): wheat 783,000; barley 264,000; oats 884,000; rye 290,000; potatoes (1951) 1,751,000. Livestock (Sept. 1951): cattle 2,633,000; sheep 261,000; pigs (April) 1,331,000; horses 415,000; chickens (April) 12,168,000. Fisheries (salt): total catch (1950) 185,200 metric tons; value 102,000,000 kronor.

Industry.—Industrial establishments (1949): 17,289; persons employed 806,800. Fuel and power: electricity (1951) 19,440,000,000 kw.hr. Raw materials (metric tons, 1951): iron ore 16,116,000; pig iron 852,000; crude steel 1,500,000. Manufactured goods (metric tons): cement (1951) 2,012,000; wood pulp (1950) 3,146,000; timber (1950) 33,500,000 cu.m.

Sweet Potatoes: see POTATOES.

Swimming. The Olympic aquatic carnival at Helsinki, Fin., was the most important event in water sports in 1952 and afforded striking evidence of the notable world-wide progress made in swimming since the previous games in 1948. Not only were all the Olympic records broken, the majority by good margins, but in most of the events the listed marks were beaten by several contestants.

United States representatives reaped premier honours in the men's field, capturing six of nine first places, and Hungarian stars were best in the women's, taking four of seven.

Winning Yankees lowered meet records with the following performances: 100-m. free style, 57.4 sec., Clarke Scholes; 1,500-m. free style, 18 min. 30.0 sec., Ford Konno; 100-m. backstroke, 1 min. 5.4 sec., Yoshi Oyakawa; 800-m. free style relay, 8 min. 31.1 sec., Wayne Moore, William Woolsey, Konno and James McLane. Jean Boiteux of France cut the time for 400-m. free style to 4 min. 30.7 sec. and John Davies of Australia that for 200-m. breast stroke to 2 min. 34.4 sec.; David Browning and Sammy Lee, U.S., scored in diving, the former winning from springboard with 205.29 points and the latter from high platform with 156.28. Hungary earned the water polo title.

Hungarian girls bettered four of the records for women. Judit Temes reduced the figures for 100-m. free style to 1 min. 5.5 sec. in the heats but was slower in the final, and Katalin Szoke, her teammate, won the event in 1 min. 6.8 sec.; Valerie Gyenge cut the mark for 400-m. free style to 5 min. 12.1 sec.;

FINISH of the 100-m. free style swimming event at the 1952 summer Olympics in Helsinki, Fin.

Eva Szekely that for 200-m. breast stroke to 2 min. 51.7 sec.; and Ilona Novak, Miss Temes, Eva Novak and Miss Szoke lowered the Olympic and world records for the 400-m. relay to 4 min. 24.4 sec. Joan Harrison of South Africa clipped the time for 100-m. back stroke to 1 min. 14.3 sec., and Patricia McCormick, U.S., garnered the springboard and platform diving crowns with 147.3 and 79.37 points.

U.S. swimmers also set the pace in shattering world standards, creating these new marks: 100-yd. free style, 49.2 sec., Richard Cleveland; 100-yd. back stroke, 56.5 sec., Jack Taylor; 800-yd. free style relay, 7 min. 40.5 sec., Moore, McLane, Donald Sheff and Frank Chamberlain; 800-m. relay, 8 min. 29.4 sec., Moore, McLane, Sheff and Richard Thoman; 300-yd. medley relay, 2 min. 47.1 sec., Taylor, Gerald Holan and Cleveland; 300-m. medley relay, 3 min. 7.0 sec., Thoman, Dennis O'Connor and Kerry Donovan. Herbert Klein of Germany shaded the breast stroke time for 100 m. to 1 min. 5.8 sec., and John Davies of Australia that for 200 yd. to 2 min. 12.9 sec.

U.S. women swimmers disposed of two relay marks, Jackie La Vine, Mary Kastelyn, Jody Alderson and Marlene Cahill dropping the time for the 400-yd. free style event to 4 min. 5.3 sec. and Sheila Donahue, Carol Pence and Betty Mullen that for the 300-yd. medley to 3 min. 18.1 sec.

Florence Chadwick, U.S., only woman to have swum the English channel from both shores, achieved another great feat in conquering the stretch of troubled ocean between Catalina Island and the California coast. First of her sex to succeed in the gruelling test, she crossed from the island to Point Vicente, about 21 mi., in 13 hr. 47 min. 32.6 sec., coming close to the course record of 13 hr. 35 min. set by Byron Summers in 1927. (See also OLYMPIC GAMES.) (L. DE B. H.)

Switzerland. A republican confederation of 22 cantons in west-central Europe. Switzerland is bounded west by France, north by Germany, east by Austria and Liechtenstein and south by Italy. Area: 15,940 sq.mi. Pop.: (1950 census) 4,714,992; (1952 est.) 4,806,000. Language: German 72.6%; French 20.8%; Italian 5.2%; Romansch 1.1%. Religion: Protestant 57.6%; Roman Catholic 41.1%; Jewish 0.5%. Chief towns (pop., 1950): Berne (cap., 146,499); Zürich (390,020); Basle (183,543); Geneva (145,473); Lausanne (106,807). President of the confederation for 1952: Karl Kobelt; vice-president of the federal council (government): Philip Etter.

History.—The year 1952 inherited from its predecessor the unsolved problem of how to pay for rearmament. The Social Democratic party continued to press for the imposition of a capital levy. Its leaders worked out a plan in accordance with which only about 80,000 persons would be affected and a referendum was held on this proposal on May 18. This was not unexpectedly rejected by 421,459 votes to 328,032 and by all the cantons as such except Zürich, Basle, Schaffhausen and the Ticino, the first three being highly industrialized and the last a poor, mainly peasant, canton.

It was decided to put the government's project for the payment of the rearmament bill to the Swiss people seven weeks later, on July 6. This proposal again asked for the bitterly opposed tax on drinks, for an increase of the *Wehrsteuer*, or—roughly—income tax, and for the severe taxation of luxury foods. It was officially backed by all the principal political parties and by the responsible bankers and industrialists represented by the *Neue Zürcher Zeitung*. And yet it soon became obvious that the propaganda against the government project was much more energetic and more liberally financed than that in its favour; it was indeed systematically organized by groups of big business people with a paid personnel for the purpose.

This opposition, as frequently before, was supported by Pierre Béguin, editor of the influential *Gazette de Lausanne*, and justified itself with the argument that it was unnecessary to increase taxation in a period of prosperity when the revenue was buoyant. In reply government supporters pointed out that the cost of rearmament had increased since the estimates were made, that the wave of prosperity was ebbing and that, if new taxes were not voted, additional government borrowing would become necessary; the latter was likely to intensify the inflationary pressure of which the country was already disagreeably aware.

When the votes registered on July 6 were counted it was found that, while only 43% of the electorate had voted, the new financial bill had been rejected by 352,205 votes to 256,035 and by all the cantons except Zürich, Berne and Solothurn.

Although the Swiss appeared unwilling to pay for their rearmament, the building up of a new modernized army and air force was enthusiastically promoted. A number of tanks were bought from France and U.S., and British models were also tried.

The insignificant Swiss Communist party (*Partei der Arbeit*) was evidently spurred on from Moscow to make efforts to exploit discontent about rearmament and taxation. On April 20 voting took place on a Communist initiative against the unpopular purchase tax, but anti-Communist feeling was sufficient to bring about a rejection by 550,712 to 128,237 votes with no single canton in favour.

The economic history of Switzerland during 1952 was relatively uneventful. The boom brought about by the effects of the Korean war subsided gradually, but without impairing the country's remarkable well-being to any extent except in a few branches of the textile industry. There were no extraordinary changes in the foreign trade by which the Swiss live, though a tendency to trade more with the German Federal Republic and less with France became evident. As the summer passed even textiles showed signs of picking up, and the highly nervous watch industry, reassured by Pres. Harry S. Truman's decision not to allow an increase of the U.S. tariffs against Swiss watches, continued to export record quantities.

In view of the anti-Berne demonstration of July 6 the government decided to let its financial problems slide for a time, meanwhile increasing the national debt. It was even expected that the general revision of financial administration that had to be prepared by the end of 1954 might be made to include the financing of the newly armed forces of Switzerland. (E. Wt.)

Education.—Schools (1948-49): primary, pupils 434,498, teachers 14,136 (5,460 women); secondary and lower middle, pupils 78,587 (girls 36,266), teachers 3,275 (women 427); universities (1949-50) 7, students 14,903, professors and lecturers 1,379; institutions of higher education 2, matriculated students 3,957, teachers 453.

Finance and Banking.—Budget: (1950 est.) revenue 1,622,000,000 Fr., expenditure 1,466,000,000 Fr.; (1951 est.) revenue 1,577,000,000 Fr., expenditure 1,901,000,000 Fr. National debt (Dec. 1950): 11,176,000,000 Fr. Currency circulation (Aug. 1952): 5,017,000,000 Fr. Bank deposits (July 1952): 7,017,000,000 Fr. Gold and foreign exchange (Aug. 1952): 1,427,000,000 Fr. Monetary unit: Swiss franc, with an exchange rate of 12.25 Fr. to the pound and 4.36 Fr. to the U.S. dollar.

Foreign Trade.—(1951) Imports 5,915,500,000 Fr., exports 4,690,900,000 Fr. Main sources of imports (1951): U.S. 16%; Germany 15%; France 10%; U.K. 7%. Main destinations of exports: U.S. 13%; Germany 9%; France 9%; Italy 7%. Main imports: machinery 10%; coal, petroleum and products 9%; steel mill products 8%; textile fibres 6%; fruit and vegetables 4%. Main exports: machinery 21%; watches, clocks and parts 22%; chemicals 16%; textiles, including apparel, 15%.

Transport and Communications.—Roads (1949): 10,250 mi. Licensed motor vehicles (Dec. 1950): cars 146,998; commercial vehicles 41,514. Railways (1949): total 3,345 mi.; state 1,812 mi.; passenger-miles (1950) 3,356,000,000; freight, ton-miles 1,215,000,000. Shipping (1951): merchant vessels 20; total tonnage 100,000; freight handled (1949) 2,252,020 metric tons. Air transport (1950): passenger-miles 91,487,000; cargo net ton-miles 2,450,000. Swissair traffic (1950): passengers 196,625; freight 2,349 metric tons; mail 1,554 metric tons; miles flown 5,618,309. Telephones (1951): 896,398. Radio receiving sets (1949): 986,679.

Agriculture.—Main crops (metric tons, 1951): wheat 235,000; rye 38,000; barley (1952) 52,000; oats (1952) 61,000; sugar, raw value 30,000;

potatoes 938,000. Wine production (1950): 1,130,000 hl. Livestock (April 1951): cattle 1,607,000; pigs 892,000; goats (1950) 180,000; horses 131,000; sheep 191,000; chickens 6,268,000; geese, ducks and turkeys (Sept. 1951) 68,000. Meat production (1951): 69,600 metric tons. Dairy produce (1951): butter 25,800 metric tons; cheese 46,800 metric tons; milk, about two-thirds of total production 17,379,000 hl.

Industry.—Industrial establishments (1950): 11,568; persons employed 492,563. Fuel and power: manufactured gas (1949) 299,000,000 cu.m.; electricity (1951) 10,271,000,000 kw.hr. Index of industrial activity (1950; 1938=100): building 116; cotton 99.5; silk 119.5; embroidery 108; metals 136; watchmaking 123; chemicals 162; foodstuffs 129. Index of employment in manufacturing (1950; 1948=100): 92.

Synge, Richard Laurence Millington (1914–), British biochemist, was born at Liverpool, Oct. 28. He was awarded the Nobel prize for chemistry jointly with Archer John Porter Martin (*q.v.*) on Nov. 6, 1952, for his part in evolving their method of identifying and separating chemical elements by chromatography. Synge was educated at Winchester college and at Trinity college, Cambridge, and he and Martin undertook chemical research together at Cambridge and, from 1941 to 1943, at the Wool Industries Research association's laboratories at Leeds, Yorkshire. In 1943 Synge went as a biochemist to the Lister Institute of Preventive Medicine, University of London, and from 1948 he worked at the Rowett Research institute, Bucksburn, Aberdeenshire. He was elected a fellow of the Royal society in 1950. In the *Dagens Nyheter* (Stockholm) of Nov. 6 Arne Tiselius (Nobel prize winner, 1948), with whom Synge had worked in 1946, wrote that the Synge-Martin method was so simple "that almost any schoolboy with ordinary laboratory equipment could demonstrate the procedure." The new chromatographic method had "given us the key to solve a number of very important problems of great current interest in chemistry, biology and medicine." In 1951 Synge, with four other scientists, formed a "science for peace" committee, and he was also a member of the British sponsoring committee of the Communist-inspired "People's Congress for Peace" held in Vienna, Aus., in Dec. 1952.

Syria. An independent Arab republic, Syria is bounded west by the Mediterranean and Lebanon, northwest and north by Turkey, east and southeast by Iraq, south by Jordan and southwest by Israel. Area: 72,200 sq.mi. Pop. (Dec. 1951 est.): 3,517,000, including 288,000 nomads and seminomads. Language: Arabic (86%); also Kurdish, Armenian, Turkish, Circassian. Religion (1952 est.): Moslem 85.7%; Christian 14%. Chief towns (pop., 1950 est.): Damascus (cap. 335,100); Aleppo (362,500); Homs (244,100); Hama (146,600); Latakia (100,500). Chief of state and prime minister in 1952: Col. Fawzi Silo.

History.—In Jan. 1952 the Syrian government closed all Moslem brotherhood offices in the country. In March the United States information centre in Damascus was blown up.

In that month the government (which had come into office on the nomination of the Higher Military council headed by the chief of the general staff, Col. Adib el Shishakly, after the military coup d'état of Nov. 29, 1951) announced a program of national land reform. It decreed the distribution of about 4,000,000 ac. of state-domain lands among groups of agricultural co-operative settlements, each comprising between 20 and 50 families and varying in size between 2,500 and 5,000 ac. This settlement scheme was designed to provide for about 16,000

families; and to help them, the Agricultural bank would make long-term loans to finance the purchase of farm machinery, seed, etc.; at the same time the government would accelerate irrigation projects, and place agricultural experts at the disposal of the settlers.

Also in March the government negotiated a trade agreement with the Lebanese government, thus ending a deadlock which had persisted since March 1950 when the customs union linking the two countries had been severed. By the new agreement free exchange of local agricultural and industrial products and free travel between the two countries (subject to Syrian military interests) were re-established; and, in accordance with the agreement reached in 1949, Syria liquidated its French franc debt by the payment to Lebanon of 44,000,000 Lebanese francs.

In April the Syrian government, following the example of Lebanon and Iraq, set up the Syrian Development council to direct the economy of the country. It also announced its support for the establishment of an industrial bank to further industrial projects and to assist with loans industries which had contracted debts during the depression of 1949.

In May the government introduced legislation controlling foreign companies operating in Syria. Under this legislation all such companies had to register with the ministry of national economy and each had to have a Syrian majority of both directors and shareholders; also the chairman or local agent had to be of Syrian nationality.

In June a new government was announced which included Col. Fawzi Silo as prime minister and minister of defense and Said ez-Zaim as finance minister.

A conference in Damascus was called on July 7 by the Syrian government for the discussion of the Arab attitude to recent Israeli moves. It was attended by delegates from Syria, Lebanon, Egypt and Jordan, and passed a resolution that future Arab delegates to the Mixed Armistice (Palestine) commission should form a joint body instead of attending as four separate entities.

In September a trade agreement was signed between Syria and Czechoslovakia. In the same month a Damascus press report announced the constitution, sponsored by Colonel Shishakly, of a new party, the Arab Liberation movement. Its program included the emancipation of women, work for all, regulation of relations between employers and workers, progressive taxation and agrarian, economic and educational reform. (O. M. T.)

Education.—Schools (April 1951): elementary 1,759, including private 228, foreign 38; total pupils 260,759, including private 48,817, foreign 6,715; secondary 136, including private 69, foreign 18; total pupils 28,595, including private 10,127, foreign 2,227. Technical schools (1950) 8, including 2 private; university 1.

Finance and Banking.—Budget: (suppl. est., January 1–June 30, 1951) balanced at L.S. 67,800,000; (1951–52 est.) balanced at L.S. 197,000,000. Currency circulation (April 1951): L.S. 225,000,000. Monetary unit: Syrian pound with an exchange rate (Nov. 1951) of L.S. 6.16 to the pound sterling and L.S. 2.20 to the U.S. dollar.

Foreign Trade.—(April–December 1950) Imports L.S. 198,000,000, exports L.S. 207,900,000.

Transport and Communications.—Roads (1950): 9,740 mi., of which 3,021 mi. are usable all the year. Licensed motor vehicles (Dec. 1950): cars 4,172, commercial 5,476. Railways (1949): 539 mi. Telephones (1951): 11,516. Radio receiving sets (1950 est.) 50,000.

Agriculture.—Main crops (metric tons): wheat (1951 est.) 700,000; barley (1951 est.) 300,000; maize (1948) 39,000; oats (1951 est.) 3,000; potatoes (1948) 15,000; rice (1948) 20,000; cotton, ginned (1950) 40,000; cottonseed (1950) 73,000. Fruit production (metric tons): grapes (1949) 150,000; olives (1950) 26,000; olive oil (1951) 9,000; oranges and tangerines (1951) 2,000. Livestock (Sept. 1951): sheep 2,363,000; goats (1949–50) 1,196,000; cattle 401,000; horses 93,000; donkeys 260,000; mules (1950) 54,000; chickens 2,171,000.

Industry.—Production: cotton (metric tons, 1950 est.) 5,600; natural and artificial silk textiles (1950) 26,700,000 m.; box calf and kid-skin leather (1947) 29,000,000 sq.m.; salt (1947) 18,800 metric tons; cement (1951) 38,800 metric tons; asphalt (1947) 14,500 metric tons.

Syrup, Sorgo and Cane: see SUGAR.

Table Tennis. The 1952 world championships in table tennis were played in Bombay, India, Feb. 1-10. The Swaythling cup was won by Hungary (J. Koczian, F. Sido, K. Szepesi); the Marcel Corbillion cup by Japan (Shizuka Narahara, Tomie Nishimura); men's singles by Hiroji Satoh (Japan); women's singles by Angelica Roseanu (Rumania); men's doubles by Norikazu Fujii and Tadaaki Hayashi (Japan); women's doubles, Shizuka Narahara and Tomie Nishimura (Japan); mixed doubles, F. Sido and Angelica Roseanu (Rumania); the Jubilee cup, restricted to players appearing in world championships at least 21 years before, Victor Barna (England). The 1953 world championships were to be held in Rumania.

The 22nd U.S. national table tennis championships were held at the Masonic temple, Cleveland, O., March 28-30, 1952. The following were the winners: men's singles, Lou Pagliaro (Brooklyn, N.Y.); women's singles, Mrs. Leah Neumberger (New York, N.Y.); junior singles, Carl Dentice (Milwaukee, Wis.); boy's singles, Dave Krisman (South Bend, Ind.); junior miss singles, Carolee Leichty (South Bend, Ind.); esquire singles (50 years old or over), Louis Scharlack (San Antonio, Tex.); senior singles, Bill Price (St. Louis, Mo.); men's doubles, Richard Miles (New York city) and Sol Schiff (Bronx, N.Y.); women's doubles, Mrs. Leah Neumberger (New York city) and Mildred Shahian (St. Louis, Mo.); senior doubles, Bill Gunn (Mamaroneck, N.Y.) and Tibor Hazi (Washington, D.C.); mixed doubles, Sol Schiff (Bronx, N.Y.) and Mrs. Leah Neumberger (New York city).

The English open championships were played March 25-29, 1952, at Wembley, London. The men's singles were won by Richard Bergmann (England); women's singles, Linde Wertl (Austria); men's doubles, Z. Dolinar and J. Harangozo (Yugoslavia); women's doubles, Diane Rowe and Rosalind Rowe (England); mixed doubles, Johnny Leach and Diane Rowe (England).

Ninety-six players from 11 of the 16 soviet republics and from Moscow and Leningrad participated in the All Union table tennis championships of the U.S.S.R. held at Vilnius in the Lithuanian S.S.R. The men's singles were won by A. Akopyan (Armenia); the women's singles by A. Mitton (Estonia).

(P. W. R.)

Taft, Robert Alphonso (1889-), U.S. senator, was born on Sept. 8 in Cincinnati, O., the son of William Howard Taft, 27th president of the U.S. He graduated from Yale university, New Haven, Conn., in 1910, and from the Harvard law school in 1913. During World War I he served as assistant counsel of the U.S. Food administration, and after the war he helped organize relief services to Europe. He served in both houses of the Ohio legislature, was elected to the U.S. senate in 1938, re-elected in 1944 and 1950. He was a strong contender for the Republican nomination for the presidency in the 1944, 1948 and 1952 national conventions.

By the early 1940s Taft had become recognized as the principal spokesman for the conservative wing of the Republican party. In the post-World War II years he became increasingly critical of the administration's domestic policy, specifically attacking huge national expenditures and the trend toward centralized government. Likewise he assailed the foreign policy of Pres. Harry S. Truman and Secretary of State Dean Acheson. Truman, Taft declared, did not have the constitutional right to commit U.S. military forces in Korea without consent of congress. He held similarly that a congressional limit should be placed on the number of U.S. troops sent to defend Europe. Any attempt to halt communism in Asia by ground forces alone, Taft contended, was futile; superior air and naval forces should be used instead.

Taft, known familiarly as "Mr. Republican," waged a bitter pre-convention contest with Dwight D. Eisenhower for the Republican presidential nomination in 1952, but was defeated by Eisenhower on the first ballot at Chicago, July 11. He then declared that he would not again seek the Republican nomination. On Sept. 12 at New York city he composed his differences of view with those of Eisenhower and announced that he would campaign for the latter without reservation. (See POLITICAL PARTIES, U.S.)

Tangier. An international and demilitarized zone of Morocco, Tangier is on the southern shore of the Straits of Gibraltar. Area: 232 sq.mi. Pop. (mid-1949 est.): 150,000 including 30,000 Europeans. Language: Arabic, French and Spanish. Religion: mainly Moslem. Administration is by a committee of control composed of the resident consuls general of France, Great Britain, the United States, Belgium, Italy, the Netherlands, Portugal and Spain, which appoints a legislative assembly of 26 members (4 French, 4 Spaniards, 3 British, 3 U.S., 1 Belgian, 1 Dutch, 1 Portuguese, 3 Jews and 6 Moslems). Tangier remained under the nominal sovereignty of the sultan of Morocco and his representative (the *mendoub*) was Hadj Mohammed el Tazi. Administrator in 1952: José Luis Archer (Portugal).

History.—On March 30, the 40th anniversary of the Fez treaty which had imposed the French and Spanish protectorates on Morocco, a violent manifestation of the Moroccan Nationalist party took the international authorities by surprise. The police opened fire and at least 12 rioters were killed and 157 wounded. The demonstration, which was apparently meant to be anti-French, got out of hand and degenerated into an attack on any European shops and cafés, of which about 100 were looted. On April 3 French and Spanish troops were moved into Tangier territory and put at the disposal of the chief of police, Colonel Legrand, a Belgian.

On April 7 the Spanish government delivered a *note verbale* to the heads of the diplomatic missions in Madrid of the seven other nations represented on the committee of control, demanding a complete revision of the 1945 agreement and a return to the convention of 1923 and 1928 (under which the chief of police had been a Spaniard). At the end of May the British government replied to the Spanish note: it did not share the Spanish view that the 1945 agreement had lapsed but agreed that certain changes in the interests of better administration would be desirable.

At the end of June it was learned the governments of France, Great Britain and the United States had suggested the creation in Tangier of a motorized police corps with a Spaniard as its commander and a Frenchman as his deputy. The municipal police of Tangier would be under the command of a Frenchman with a Spaniard as his deputy.

Tanks: see MUNITIONS OF WAR.

Tariffs. There were no major new trends in the tariff policies of the world during 1952. Activities centring around the General Agreement on Tariffs and Trade related primarily to the clarification of relationships among the contracting parties. With the formal inauguration of the Schuman plan, members of the new European Coal and Steel Community initiated measures designed ultimately to effect an integration of their tariffs in respect of coal and steel products. New restrictive

import measures were adopted during the year by the United States; largely because of the "dollar shortage" problem in many areas, these measures attracted considerable world-wide interest. Nevertheless, they effected no significant change in the over-all tariff structure of the United States.

General Agreement on Tariffs and Trade.—Near the close of 1952, 34 countries were contracting parties to the General Agreement on Tariffs and Trade (G.A.T.T.). Although 37 countries had acceded to the General agreement, 3 of them—China, Lebanon and Syria—had later withdrawn. During the year the major G.A.T.T. activity was the seventh session of the contracting parties held at Geneva, Switz., beginning Oct. 2. The agenda included the following items: (1) the waiver of most-favoured-nation and other contractual obligations under the G.A.T.T. to permit members of the European Coal and Steel Community to adjust their tariffs on coal and steel products as envisaged in the Schuman plan; (2) the application of Japan for accession to the General agreement; (3) the French plan for a general lowering of customs tariffs—a proposal which would require participating countries to reduce their average tariff rates on designated groups of commodities by a specified percentage; (4) consultations with contracting parties maintaining discriminatory import restrictions for balance-of-payments purposes, *e.g.*, consultations with British Commonwealth countries and others; (5) complaints by individual contracting parties of alleged violations of the provisions of the General agreement; (6) requests by individual contracting parties for waivers from specific obligations assumed under the General agreement; and (7) reports by individual contracting parties on various matters, such as progress reports on the development of customs unions in which one or more contracting parties had participated.

No trade agreement negotiations were undertaken within the framework of the General agreement during 1952. However, a few bilateral agreements providing for the exchange of tariff concessions were concluded.

The Schuman Plan.—Following ratification of the European Coal and Steel Community (Schuman plan) by the six participating countries (France, Germany, Belgium, the Netherlands, Luxembourg and Italy), the foreign ministers of those countries agreed that the community should come into effect on Aug. 10. Among other measures designed to effect the joint development of the major coal and steel resources of western Europe, the plan contemplated the establishment, as far as feasible, of a single community or common market for trade in coal, coke, iron ore, iron and steel. The plan, therefore, provided for the elimination of import duties and other trade restrictions on these commodities between the various members of the community.

The plan also provided for the eventual establishment of minimum rates of duty below which, and maximum rates above which, the Schuman plan countries would not tax imports of coal, iron and steel commodities entering from outside the community. Some of these tariff provisions were, at least technically, in violation of provisions of the General Agreement on Tariffs and Trade. Consequently, it became necessary for the Schuman plan countries to obtain a waiver of most-favoured-nation and other commitments from the members of G.A.T.T. to permit full operation of the plan. The granting of such waiver was one of the many subjects considered at the seventh session of G.A.T.T. (*See also* EUROPEAN UNION.)

General Tariff Revisions.—Early in the year the Nicaraguan chamber of deputies authorized the creation of a commission to undertake a complete revision of that country's tariff.

A comprehensive tariff revision was initiated in Czechoslovakia. The government announced that the system of specific duties would be replaced largely by duties levied on an ad valorem basis. As an initial step, a number of imports were

made immediately subject to ad valorem duties.

A general tariff revision was being contemplated in Denmark. That country's tariff, about 30 years old, was considered by the government to be in need of both a revised nomenclature and a new schedule of duties. The objectives, apparently, included making about 200 groups of commodities dutiable on an ad valorem basis as well as giving additional protection to selected industries.

A comprehensive revision of the Norwegian tariff schedule became effective in Jan. 1952. Rates of duty on more than 600 of the 1,000 or more items in the Norwegian tariff were revised, and additional modifications were contemplated. Duties levied on a specific basis were increased generally by about 100%. Various specific duties, moreover, were converted to an ad valorem basis. Rates of duty on items previously dutiable on an ad valorem basis were not altered.

New tariff schedules also became effective during the year in Jordan and in St. Pierre and Miquelon. A comprehensive revision was also in project in the Belgian Congo.

Less Extensive Revisions.—The year 1952 was the third consecutive one during which there were relatively few minor changes in the tariff schedules of individual countries. Upward revisions in duty of a minor or piecemeal character were materially more prominent during the year than those providing lower import duties; as indicated, however, the aggregate of these revisions did not appreciably alter the world tariff structure. Countries raising their duties or import fees on an important number of commodities were: Bolivia, Chile, the Dominican Republic, Mexico, Peru, Venezuela, Finland, Ireland and Egypt.

The only revision noted during the year providing for lower duties on a substantial number of import items was that provided in Colombia. Near the beginning of the year that country, in the first important revision of its recently adopted tariff, reduced duties on about 500 items including, particularly, various drug products, chemicals and agricultural implements. Tariff rates were increased for a few commodities.

United States.—The most publicized developments in United States tariffs during 1952 related to activities of various groups of domestic producers seeking increased protection against imports. Such activities were reflected principally in applications for escape-clause investigations filed with the United States tariff commission under the escape-clause provisions of the Trade Agreements Extension Act of 1951. During the first nine months of the year, the tariff commission had 22 such investigations pending, compared with 11 during the first nine months of 1951. Broadly speaking, if the commission found after investigation that a domestic industry was being seriously injured or threatened with serious injury as a result of a trade-agreement concession, the president could impose whatever import duty or import quota was recommended by the commission.

The tariff commission also had under way other investigations which could lead to increased import restrictions. By direction of the president, two investigations—one on edible tree nuts and the other on wool and wool tops—were in progress under the provisions of section 22 of the Agricultural Adjustment act; under that statute, the president could impose import fees or quotas if the commission determined imports of the products concerned were interfering materially with programs of the department of agriculture. In response to a senate resolution, the commission also undertook an investigation of chinaware under the provisions of section 336 of the Tariff act of 1930; if the investigation established differences in cost of production of those articles in the United States and foreign countries, the import duty could be increased or decreased, within statutory limits, to offset the difference.

During the year, the department of agriculture continued to restrict imports of cheese, butter and other fats and oils, casein, flaxseed, peanuts and rice under section 104 of the Defense Production Act of 1950. The United States had granted tariff concessions on a number of these products in trade agreement negotiations. Some of the restrictions, such as that on butter, virtually excluded imports; others, such as those on cheese, reduced imports substantially below the levels prevailing before the quotas were imposed.

The increasing resort to the "escape clause" and other devices for restricting imports by individual United States producing interests was regarded apprehensively by the governments of various countries which traditionally export to the United States market. European observers expressed alarm that the United States appeared to be reversing its policy of espousing liberal international trading and was thereby turning to more aggressive protectionism.

In January the Italian government, in a memorandum to the state department, described "the serious economic, social, and psychological repercussions" in Italy resulting from United States trade restrictions and other measures which unfavourably affect Italian exports. Specifically, Italy protested actions under the escape clause, the "buy American" policy and restrictive measures which had been initiated under section 104; all of these measures, they said, were being employed to limit United States imports of Italian products, particularly almonds, olive oil and cheese. The Italian foreign office recalled that through the Economic Cooperation administration the United States had encouraged Italy and other European countries to "make a frontal attack on the dollar shortage problem" by increasing exports to the United States. It feared, however, that the renewed recourse to restrictive trade practices by the United States constituted a marked inconsistency between principle and practice.

A similar protest by the United Kingdom was registered early in April 1952. That government expressed apprehension over "a most disturbing increase" in the number of escape-clause applications, some of which affected important United Kingdom export products such as motorcycles, bicycles, chinaware, tobacco pipes and wood screws.

Shortly thereafter, also in April, Belgium took more positive action. The Belgian government notified the United States that the tariff concession on mastic gums granted in G.A.T.T. would be withdrawn in view of the United States action on hatters' fur. This was the first case of formal retaliation by a country adversely affected by United States action under the escape clause.

Discontent on the part of G.A.T.T. members with regard to the United States import restrictions, particularly the import quotas on cheese imposed under section 104 of the Defense Production act, came to a focus at the sixth session of the contracting parties held in Sept. 1951 and at the meeting of the Intersessional committee held in Feb. 1952. Nine signatories to the General agreement protested that the United States had impaired or nullified G.A.T.T. commitments by its actions under section 104 and that they either were entitled to compensatory concessions or were privileged to withdraw concessions of equal benefit to the United States.

Although requests by various United States producers for protection against imports were more numerous in 1952 than in any year in at least a decade, their requests were not automatically granted by the government. Of the 22 escape-clause investigations before the tariff commission, 8 were disposed of by Oct. 1. In the case of two—relating to hatters' fur and dried figs—the commission recommended increased import restrictions, which the president authorized. In the case of two

others—affecting garlic and watches and watch movements—the commission recommended increased import duties; the president, nevertheless, rejected those recommendations. In connection with four other investigations—relating to motorcycles, blue-mould cheese, spring clothespins and groundfish fillets—the commission did not find serious injury and, therefore, did not recommend increased import restrictions. The 14 remaining cases were still before the commission.

Late in June, the congress extended section 104 of the Defense Production act in a modified form. The modified provisions were generally regarded by importers as more flexible and moderate than the previous statute. In July the department of agriculture, under the new provisions, removed the quotas on imports of certain types of cheese and some rice and flaxseed products; it also relaxed the quotas applicable to certain other types of cheese. Most of the quotas, however, continued unchanged. At the beginning of October, the department removed import quotas on a few other varieties of cheese and, as permitted by the revised law, increased all quotas under section 104 by 15% "in the interest of international trade and relations." (See also INTERNATIONAL TRADE.)

(D. L.H.; G. P. H.)

Taxation. In his economic report for Jan. 1952, Pres. Harry S. Truman proposed that congress "provide at least enough additional revenues to reach the revenue goal proposed last year, by eliminating loopholes and special privileges, and by tax rate increases." This would have meant providing additional revenue of about \$5,000,000,000. The president, however, did not send any special tax message to congress, and no further details on his proposals were given by the treasury. Congressional and public opinion was strongly opposed to further tax increases.

In his January budget message the president predicted a deficit of \$8,200,000,000 for the fiscal year 1952 and \$14,400,000,000 for the fiscal year 1953. Both revenues and expenditures turned out to be less than the January budget estimates. Expenditures fell short of the estimates by more than did revenues with the result that the actual deficit in the fiscal year 1952 was \$4,000,000,000. Nevertheless, total budget receipts in the fiscal year 1952 were \$62,100,000,000, an all-time high and an increase of \$14,000,000,000 over the fiscal year 1951. Estimates for the fiscal year 1953 indicated, late in 1952, total budget receipts of \$68,700,000,000 and a deficit of \$10,300,000,000.

U.S. Legislation.—In 1952 there was no major federal tax legislation. Among several minor changes in the law were the following: the charitable deduction allowed individuals was increased from 15% to 20% of adjusted gross income. The capital gain on securities purchased by an employee through a stock purchase plan operated by his employer was made taxable only when the stock was sold and the gain actually realized. Under the excess profits tax some changes were made in the definition of base period earnings for corporations completing contracts or making deposits under the Merchant Marine act and certain corporations which used copper and zinc as raw materials and which increased their total facilities by 80% or more in the base period; also when a taxpayer operated a branch at a loss during the base period, the loss, subject to certain restrictions, was not required to be deducted from the base period earnings credit.

Although there was no change in tax rates, people were paying heavier taxes in 1952 because the Revenue Act of 1951 (passed in Oct. 1951) became fully effective.

U.S. State Taxation.—State tax collections increased by about 10% in the fiscal year 1952. The increase was largely the result of increases in income, sales and prices. Increases in tax

State Tax Collections by Source*

Fiscal Year 1952†

	Amount (millions)	Percentage distribution
Total	\$9,839	100.0

"THE TRIAL of the former tax official may proceed, your honor . . . but it wasn't easy to get a jury without any prejudice against the Bureau of Internal Revenue . . ." a 1952 cartoon by Lichty of the Chicago Sun-Times Syndicate

rates and new taxes were not of much importance; in some states there were reductions in rates or increases in exemptions under certain taxes.

Income taxes were cut, either by lowered rates or increased exemptions, in Colorado, Georgia, Louisiana, Maryland, Mississippi, New York and Virginia. Rates were increased in Kentucky and emergency rates on corporations in Pennsylvania and Rhode Island were extended.

There was little change in sales, use and gross receipts tax rates. New exemptions were added in Arizona, Georgia, Michigan, Rhode Island, Virginia and South Carolina. Massachusetts and Virginia applied a 5% tax to the gross receipts from television and radio broadcasting rights at boxing matches. New York imposed a 15% admissions tax on trotting race meetings. Rhode Island extended its 2% sales and use tax through May 31, 1953.

Property tax changes were largely increases in exemptions. Michigan increased its tax on income-producing intangible personal property from 3% to 3.5%. Colorado imposed a tax of $\frac{1}{2}$ mill per dollar of assessed valuation on owners of poultry and livestock other than sheep and goats.

Maryland introduced a tax of \$5 per 100-proof gallon on distilled spirits seized and "on the potential quantity distilled spirits to be derived from the quantity of mash seized." Virginia introduced a \$1,500 licence tax for the manufacture of alcoholic beverages from fruit or fruit juices.

Gasoline taxes were increased in the District of Columbia, Massachusetts and Missouri. Louisiana lowered its rate of 9 cents a gallon to 7 cents.

The relative importance of various state taxes remained about the same as in previous years. The accompanying table shows collections from various taxes and the percentage breakdown for the fiscal year 1952.

Tax Treaties.—The year 1952 witnessed a substantial increase in the area covered by international treaties seeking to eliminate double taxation. Effective treaties now existed between the United States and Canada, Denmark, France, Ireland, the Netherlands, New Zealand, Norway, Sweden, Switzerland, the Union of South Africa and the United Kingdom. Pending exchange of ratifications by the governments concerned were tax treaties between the United States and Belgium, Finland and Greece. Negotiations had been started with Argentina, Australia, Austria, Brazil, Colombia, Cuba, Israel, Italy, Japan, Luxembourg, Mexico, the Philippines and Uruguay.

Canada.—In 1951, to meet an expanded defense program, various increases were made in excise taxes and a surcharge of 20% was levied on existing personal and corporate tax liabilities (the surcharge on corporations applied to the tax on profits in excess of \$10,000). For the fiscal year ending March 31, 1952, total revenues exceeded budget estimates by 7.5% while total expenditures fell short of budget estimates by 1.5%. The actual budget surplus was \$356,000,000 instead of the estimated \$30,000,000. In the budget speech of April 8, 1952, the minister of finance, Douglas Abbott, proposed a reduction of about 6% in personal income taxes, effective July 1, 1952, in addition to reductions in excise and sales taxes. These changes were expected to reduce revenues in a full year by \$146,000,000. Nevertheless, the budget surplus for the fiscal year ending March 31, 1953, was expected to be \$9,000,000—in effect, there was a balanced budget.

Since the reduction in personal income taxes was effective for only half of 1952, the reduction amounted to about 3% for the whole year. Also the reduction was incorporated in a new rate schedule which replaced the defense surcharge. In 1952 the tax rate on the lowest taxable income bracket was 17.5%, excluding the old-age security tax, and 91% on the highest bracket.

In 1951 an Old-Age Security act was passed under which payments of \$40 per month were made to citizens over 70 years of age without a means test. These payments were financed by a 2% tax on personal incomes (with a maximum of \$60 per year), a 2% tax on corporate income and 2% of the existing general sales tax. The old-age security taxes became effective July 1, 1952. The reduction in the personal income tax mentioned above was apart from this new tax, so that the net reduction in personal income tax liabilities was about 2% in 1952 and about 4% in 1953.

Several technical changes in the personal income tax were introduced. The most important of these was a doubling of the maximum amount of medical expenses that could be deducted. Medical expenses could be deducted in excess of 4% of income up to a maximum amount of \$1,500 for a single person and

\$2,000 for a married person, with additional allowances for dependents.

The major change in the corporate income tax was a consolidation of the federal and provincial taxes in nine provinces. The federal tax rate was increased from 15% to 20% on the first \$10,000 of profits and from 45.6% to 50% on profits in excess of \$10,000. This increase replaced a previous provincial tax of 5% in eight of the provinces which would receive equivalent payments from the federal government. In August, Ontario, which had a corporate tax rate of 7%, also entered the "tax rental" agreements. In Quebec, where the corporate tax rate was 7%, the provincial tax was to continue, but a 5% tax credit would be allowed against the federal tax on profits earned in the province. Since the federal rate on profits of more than \$10,000 was increased by 4.4 instead of 5 percentage points, the consolidation involved a slight decrease in ordinary corporation taxes. In addition, however, corporations became subject to a 2% old-age security tax, so that the top corporate rate was 52% in nine provinces and 54% in Quebec.

Special relief was granted to certain public utility companies in recognition of their need for raising large amounts of capital and of the fact that their rates were subject to public control. The rate on companies whose main business was the generation or distribution of electrical energy, gas or steam to the public was reduced to 43% excluding the old-age security tax. This relief was intended to be temporary; when the general corporation rate was reduced to 43% or less, the relief would be eliminated.

Certain reductions and changes were made in commodity taxes. Except for a few additions to the list of exempt goods, there was no change in the general sales tax. The rate of this tax was 10%, of which 2% consisted of the old-age security tax. The second category of commodity taxes consisted of the special excises which applied to consumers' durables and other less essential goods; the rate had been raised in 1951 to 25% with a few exceptions and in general it applied in addition to the general sales tax. Since shortages of critical materials appeared less acute than in 1951, and consequently there was less need of restricting purchases of the goods subject to the special excises, the rate was reduced to 15%. Also certain household appliances which had been taxed at 15% were exempted from the special excise; the rate on soft drinks, which had been 30%, was reduced to 15%. The third category of commodity taxes was those on alcoholic beverages and tobacco. In 1951 the rate on cigarettes had been increased to 23 cents a pack with the result that there was a sharp drop in consumption. Instead of an increase of \$21,000,000 which the minister expected from this tax, revenue declined by \$1,000,000. In 1952 the rate was reduced again to 20 cents per pack. Only minor changes were made in the taxes on alcoholic beverages. Changes in commodity taxes became effective April 9, 1952. (See also BUDGET, NATIONAL; DEBT, NATIONAL; MOTOR TRANSPORTATION; MUNICIPAL GOVERNMENT.)

(H. J. Mr.)

Tea. The most notable tea event of 1952 was its removal in October from the restricted list in the major consuming country, Great Britain, after 12 years of rationing. Consumption in the United States was indicated at an average of 0.64 lb. per person per year, 96% of the 1951 and prewar levels. United States imports of 84,146,000 lb. in 1951 were 25% below 1950. Imports in 1952 were at about the 1951 rate.

World production was 1,277,000,000 lb. in 1951 (excluding China, the major producer, Indochina and the U.S.S.R.), 6% above 1950, with a further increase anticipated in 1952. India led with 615,000,000 lb.; Ceylon, second highest, produced 324,200,000 lb.

Tea Exports from Principal Producing Countries

Country	(In thousands of pounds)			
	1951*	1950	1949	Average 1935-39
India	445,000	391,000	490,000	332,735
Ceylon	305,200	295,100	297,573	221,568
Indonesia	88,400	69,873	52,743	153,175
China		25,000	20,000	79,483
Japan	18,954	15,944	16,049	43,280
Pakistan	47,200	15,900	27,265	†
Nyasaland		15,157	12,770	8,834
Formosa	20,277	15,116	24,000	22,779

*Preliminary.

†Included in India.

Major producing areas exported 994,300,000 lb. in 1951, as compared with 867,800,000 lb. in 1950. The International Tea committee's export quota was set at 135% of standard exports.

Telegraphy. Outstanding among the United States telegraph industry's achievements in 1952 was the rapid expansion in the use of Western Union's facsimile telegraph methods for the transmission of intelligence between and within business organizations.

In the years between World War II and 1952 the capacity of the nation's telegraph system was doubled and its efficiency vastly increased by the installation of a network of 15 high-speed message centres. An "electrical brain" in each centre routes and flashes telegrams from all points to their destinations. A telegram is typed only once, at the point of origin.

Desk-Fax.—To supplement this high-speed network between cities, rapid progress was made in 1952 in the use of facsimile methods to speed telegrams between local Western Union offices and customers' offices. Thousands of Desk-Fax miniature sending and receiving machines were installed for customer use, enabling businessmen to send and receive their own telegrams by pressing a button.

The telegraph company had approximately 10,000 Desk-Fax machines in use in 48 cities, more than double the number at the end of 1951. Thousands of these machines were to be installed in additional cities in 1953. Installation of the Desk-Fax in customer offices in London, Eng., was begun in March 1952 to increase speed and efficiency in handling messages to and from Western Union's main cable office in that city.

Intrafax.—To speed communications between departments or units of any company, Western Union developed the Intrafax, a customer-operated, leased facsimile system. Such systems were installed in the department-store field between store and warehouse to speed deliveries to customers; in the air-line field to link scattered departments; in the banking field between branches and the central file of a bank to verify check signatures, and between a number of large banks and a central agency for the transfer of funds.

Radio Beam.—During the year Western Union increased the transmitter power of its radio beam system between New York, Philadelphia, Washington and Pittsburgh from one-tenth watt to ten watts by installing three-cavity Klystron amplifier tubes developed specifically for the purpose. This reduced fading and improved continuity of operation.

High-Speed Fax, the world's fastest practical communication method, with a faster-than-speech speed of 3,000 words a minute, was placed in regular use flashing telegraph traffic between New York city and Washington, D.C., on the Western Union microwave beam.

Armed Services.—Western Union was carrying out in 1952 large contracts with the armed services involving high-speed switching systems, telegraph carrier systems, facsimile telegraph equipment and radio techniques. It greatly expanded the nation-wide push-button telegraph switching network it provides to the U.S. air force, linking more than 200 air force stations

with 130,000 mi. of telegraph circuits. The telegraph company also enlarged some of the extensive private wire switching systems it leases to many American companies.

The Press.—Telegraph service to the press reached record-breaking proportions during the Republican and Democratic nominating conventions in July. Western Union flashed 16,445,647 news words to the press in the United States and other countries during the conventions, and handled additional millions of news words during the presidential campaign.

Weather Service.—The telegraph company in 1952 began providing scientific weather forecasts to hundreds of customers in 26 states, acting as agent for the weather forecasting services of the National Weather institute. Industry and agriculture were able to save many millions of dollars annually through wider use of scientific, pin-pointed weather information.

Submarine Cable Amplifiers.—With the six installations scheduled during 1952, nine vacuum tube amplifiers would be in use on the ocean bottom in eight of Western Union's transatlantic cables between the United States, Newfoundland and the British Isles. These amplifiers triple the word speed of the cables and provide additional all-weather communication facilities to ensure secret, high-speed handling of military and diplomatic communications in times of emergency, and at the same time to meet the growing peacetime demand for rapid and dependable international service. Plans for 1953 called for the construction and installation of six additional repeaters.

(See also FEDERAL COMMUNICATIONS COMMISSION.)

(W. P. MA.)

Telephone. According to the latest available information, there were approximately 79,000,000 telephones in operation in the world during 1952. More than 57% of these were in the United States.

Ceremonies celebrating the 25th anniversary of the opening of transatlantic telephone service between New York city, N.Y., and London, Eng., were held Jan. 7, 1952. By that time 96% of the world's telephones had been interconnected. Overseas telephone service was also being used by about 100 vessels on the high seas. Among the places added to the telephone network during 1952 were the Azores, Madeira, Cape Verde Islands, Angola, Mozambique, Lebanon, Madagascar, Dakar and Iraq.

The year also marked the 25th anniversary of the first public demonstration of television over telephone wires.

As the Bell system's radio relay and coaxial cable network was extended, 12 more U.S. cities were brought into the national television network—Dallas, Tex., Denver, Colo., Fort Worth, Tex., Houston, Tex., Miami, Fla., New Orleans, La., Oklahoma City, Okla., Phoenix, Ariz., Portland, Ore., San Antonio, Tex., Seattle, Wash., and Tulsa, Okla. (See also TELEVISION.)

Going forward with their largest construction program since 1948, the Bell Telephone companies continued during 1952 to meet a growing demand for service. A change in service, to a line with fewer parties or to an individual line, was made for more than 660,000 customers during the first nine months of the year. An important part of the new construction program was the conversion of manually operated telephones to dial operation. At the end of August, 78.6% of the telephones served by Bell companies were dial operated.

Long-Distance Dialing.—The trial begun by the Bell system

Table II.—Bell System Statistics

(As of Sept. 1, 1952)	
Number of telephones	38,655,000
Dial telephones	30,400,000
Mobile telephones	12,000
Miles of wire:*	
Exchange wire	125,957,000
Toll wire	28,217,000
Total	154,174,000
Number of central offices	8,795
Average daily conversations	148,082,000
Route miles of radio relay	6,500
Route miles of coaxial cable	9,000
Channel miles of television transmission facilities	28,000
Total investment in plant and equipment	\$11,592,000,000

*As of July 1, 1952

on Nov. 10, 1951, in Englewood, N.J., on the dialing of long distance calls by customers was continued during 1952. Indications were that customer long-distance dialing was practical and would make service faster and more convenient.

The Englewood customers were able to dial directly to telephones in cities as far away as San Francisco, Calif. Automatic accounting equipment recorded the charges when a subscriber dialed a long-distance call, summarized the call information and printed it in final form on the customer's monthly bill. Cross-country calls by this method could be made in a matter of seconds.

Operator Dialing.—The operator dialing method of handling calls, which had been rapidly developing with the growth of dial systems, was improved and extended in 1952. Four out of ten of the Bell system's long-distance calls were being handled by operator dialing. With this system calls were handled by an originating long-distance operator who, in most cases, reached the called telephone in a distant city without the help of other operators along the route or at the destination. This was done by means of dial codes based on a universal numbering system and master dial switching systems.

During the year major dial switching centres for long distance calls were placed in operation in Omaha, Neb., Houston, Tex., and Cincinnati, O. Each of these centres was the core of a dialing network extending over a large area. The interconnected networks, together with other smaller systems, enabled operators to dial straight through to distant telephones in more than 1,600 U.S. cities and towns.

Rural Service.—The telephone companies continued during 1952 to provide telephone service wherever it was needed in the rural areas of the country. In July the number of Bell system rural area telephones added since World War II hit the 2,000,000 mark. Continued progress to improve the quality of rural service was made through reductions in the number of subscribers on rural lines and improvements in telephone ringing.

Defense and Military Developments.—A telephone service vital to U.S. defense was instituted during 1952 when the Bell system, at the request of the army anti-aircraft command, began furnishing all the communication facilities required for its operation. The wire communication circuits being installed consisted of numerous multistation private lines which were used between an operations control centre and strategic sites. The Bell system also was authorized to back up these wire facilities with the installation of radio communication between control centres and gun locations. Pilot installations were made and intensive manoeuvres staged to test the equipment prior to completing the network.

Another development of 1952 was a new military field telephone far superior to the one used in World War II. The 1952 version of the signal corps telephone was designed by the Bell Telephone laboratories and manufactured by the Western Electric company. It was lighter, smaller and more rugged. It operated for several miles without batteries and could withstand near-by gun blasts. It could be submerged in water without effect and could be used by a soldier wearing heavy arctic mit-

Table I.—U.S. Telephone Statistics

(As of July 1, 1952)

Number of telephones	46,880,000
Bell system telephones	38,383,000
Non-Bell telephones	8,497,000
Average daily conversations	182,000,000
Total investment in plant and equipment	\$12,740,000,000

tens. It would work effectively at altitudes of more than 10,000 ft. and at temperatures from 130° F. to -40° F. (See also FEDERAL COMMUNICATIONS COMMISSION; RURAL ELECTRIFICATION.) (C. F. CG.)

Television. Despite limitations on its development because of the freeze on construction of new stations imposed by the Federal Communications commission (FCC) in late 1948, television in the United States reached the proportions of a \$3,000,000,000-a-year business. The FCC on April 13, 1952, issued its sixth report and order lifting the freeze, effective June 2, 1952. As of that date, 109 television broadcasting stations were on the air, operating on 12 channels in the very high frequency (VHF) portion of the radio spectrum and their combined service areas included about 24,000,000 homes, of which nearly 18,000,000 had television receivers.

The commission's action made provision for additional stations within the 12 VHF channels and established 70 new channels in the ultra high frequency (UHF) band. Seventeen of these were "flexibility" channels to provide for future expansion. A table of assignments was adopted allocating specific channels to communities so as to make provision for more than 2,000 stations in the United States and its territories. The commission's order authorized power increases for existing and contemplated stations. The table of assignments included provision for 233 noncommercial educational television stations to be supported by educational and philanthropic interests.

By Sept. 1 the commission had processed 177 of the applications filed for construction permits for new stations, granting 11 in the VHF and 32 in the UHF channels and ordering hearings on the remainder. A total of 737 applications were on file awaiting commission action. Actual construction was begun on several new stations and in July, KFEL in Denver, Colo., went on the air as the first post-freeze TV station.

Ultra High Frequency Television.—Extensive use was made of the RCA-NBC experimental television station, KC2XAK, at Bridgeport, Conn., in operation until August, as a proving ground by means of which a large number of television receiver manufacturers tested their combination UHF-VHF receiver and UHF converter designs. The KC2XAK transmitter was sold to the Empire Coil company and was transported to Portland, Ore., where in September, as KPTV, it became the first commercial UHF station. Field tests were conducted and the results proved more favourable than anticipated. The success of this station resulted in a flood of orders for UHF transmitting equipment. Low-powered UHF transmitters were available and there was assurance that several manufacturers would have transmitters of 5- to 12-kw. power in full-scale production by the year's end.

The operation of KPTV aroused great interest in both government and industry since it was recognized that only through utilization of UHF channels could television become truly nation-wide in scope. It was estimated that by the end of 1955 television service would be available to approximately 95% of all United States families.

Colour Television.—The order of the director of defense mobilization issued in late 1951 banning the production of commercial colour television receivers was modified on June 24 so as to permit manufacture of colour equipment but subject to certain restrictions. Production of home colour receivers was not undertaken by any of the television receiver manufacturers. CBS did not resume television broadcasting in colour.

The National Television System committee (NTSC) continued its activity in field testing of proposed compatible colour television standards. Experimental tests of these standards over existing commercial television stations during normal program

hours were authorized by the FCC although its existing policy permitted such tests only after regular broadcasting hours. The commission continued to receive full information on the NTSC tests, in keeping with the caveat attached to its 1950 order that its doors were still open for consideration of any proposed system meeting its specified criteria.

Television Receivers.—Effects of the long-continued freeze on the construction of new television stations were reflected in receiver production for the first eight months of 1952, which stood on Sept. 1 at 2,939,144 units, with the total for the year, however, expected to reach 5,500,000 or approximately 200,000 sets more than the number produced in 1951. Total television sets in use reached 18,724,000 by Sept. 1.

In television receivers the trend toward larger picture tubes continued, the majority of receivers using 17-in. or larger sizes. Manufacturers were ready to place on the market, in phase with the construction of UHF stations, converters and combination UHF-VHF receivers.

Television receiver prices held relatively constant throughout the year. These prices were averaging 15% or more below the ceilings established by the Office of Price Stabilization. This resulted in a removal of the ceilings, with a continuation of only a spot check as a means of control.

During 1952 there were approximately 100 manufacturers of TV receiving sets, including assemblers and kit makers. There were 37 manufacturers of cathode ray or picture tubes, 11 of whom also produced receiving-type tubes.

Television Broadcasting.—The 109 stations operating on regular schedules served 64 metropolitan areas. The commission reported during the year that 95 of these stations were operating at a profit. In the larger metropolitan areas operations were invariably profitable and billings showed a marked increase. Radio billings showed reductions, though not in proportion to the television gains, and rate cuts averaging 14% went into effect in the operation of the CBS and NBC radio broadcasting networks.

The most important addition to the television network facilities in 1952 was the extension by the American Telephone and Telegraph company of its radio-relay and coaxial-cable systems so as to reach major communities in the south, southwest and northwest. Thus, by the time the national political conventions were held in Chicago, 107 television stations in 65 cities were interconnected by 29,500 mi. of network. By the end of 1952, the Bell system television network was expected to serve 113 television stations in 71 cities, utilizing 31,000 mi. of network.

Of outstanding significance in television broadcasting during the year was the coverage of the national political conventions, in which all television stations, with the exception of one which lacked interconnection, participated. New telecasting techniques, including the first operational use of the "walkie-lookie," brought audiences of 65,000,000 into intimate touch with events as they occurred on the convention floor.

Proposals with regard to the televising of judicial and congressional proceedings raised national policy issues debated widely by bar associations, committees of congress and civic groups.

The National Collegiate Athletic association made available for broadcasting 11 major football games for the 1952 season, and the National Broadcasting company purchased the television rights for a figure in excess of \$2,500,000. Blackouts continued with respect to championship prize fights. Legal and economic issues relating to the telecasting of major sports events remained unsettled.

During the year an increasing number of feature programs were originated from films produced specifically for television.

A civil antitrust complaint was filed in Los Angeles, Calif.,

by the U.S. department of justice charging with conspiracy to restrain interstate commerce 12 motion-picture firms producing and distributing 16-mm. feature films of the type used for television broadcasting. There were no major changes in the situation with respect to the availability to television of feature motion pictures.

In Jan. 1952 the National Association of Radio and Television Broadcasters adopted its television code, effective March 1, 1952. Subscribers to this code agree to advance education and culture through television programming and to accept responsibility with respect to program material in the interest of decency and decorum.

Theatre Television.—Interest in theatre television continued and by September 75 theatres had either installed or were installing projection equipment. Sporting events of wide public interest were presented exclusively by theatre television through leased interconnection facilities. The competition between theatres and television broadcasters in the "live" showing of events of national interest held the hope for the motion-picture industry of reducing the severe inroads of television on theatre attendance.

By far the largest network of theatres to carry a major sports event was used when 50 theatres presented the Jersey Joe Walcott-Rocky Marciano heavyweight championship fight. An audience totalling 125,000, which paid about \$400,000 at the box office, was reported. Many thousands of fans were turned away for lack of seats. The first drive-in theatre to utilize theatre television equipment, in Rutherford, N.J., was among the 50. A standard RCA theatre television system was used, with the equipment being mounted on a truck 125 ft. from the screen to provide a 24- by 36-ft. picture. An audience estimated at between 15,000 and 20,000 persons viewed the pictures. As a result of this drive-in theatre's success, a new field for theatre television operations was envisioned.

The hearing announced by the FCC in April 1951 to determine whether or not a band of microwave radio frequencies should be allocated to theatre television for operation of its own network interconnections began in Oct. 1952, with the conclusion of the testimony scheduled for early 1953.

Development work on theatre colour television continued during the year. Twentieth Century-Fox gave a series of colour theatre television demonstrations using the Eidophor, a device started 13 years before by Fritz Fischer working at the Swiss Federal Polytechnical institute in Zürich. The Eidophor differs from the conventional television picture tubes in that the source of light is an arc lamp such as is used in motion-picture projectors. A cathode ray beam is employed to control the light intensity on the projection screen. In the Twentieth Century-Fox colour demonstrations, a field sequential colour system using a rotating colour filter disk was employed. The pictures were 11 by 15 ft. with a high-light brightness of approximately five foot-lamberts.

Subscription Television.—Zenith Radio corporation, sponsor of a system called "Phonevision," early in the year filed a petition before the commission seeking approval of the principle of subscription television and modification of rules of the commission so as to permit this type of operation. A public hearing was requested on which the commission had not taken action.

Other subscription television projects which were in the development and testing stages were the "Subscribervision" system of the Skiatron corporation of New York city and the "Telemeter" system of the International Telemeter corporation and Paramount Pictures.

Wired Television.—The year saw substantial growth of wired television or "community-antenna" systems, which brought television programs into smaller towns and cities shadowed out

from the good service range of the radio transmissions of existing stations by intervening hills or mountains. A Community Antenna association was formed, with more than 100 member companies, and an estimated 80 or more installations were in operation or under construction. "Telemeter" had undertaken to conduct tests of its subscription method, operated in conjunction with wired television in Palm Springs, Calif. The number of wired antenna and distribution systems for receivers in hotels and apartment houses also showed a steady increase.

Other Developments.—Other developments relating to television included the serving of subpoenas on 17 radio and television manufacturers as a result of action taken by the department of justice in an effort to determine whether antitrust laws were being violated.

Of striking significance were the applications of the techniques of television in other fields of science including radar design, pictorial communications and electron microscopy. Industrial applications of television, such as in the control of processes involving hazard to life, illustrated the versatility of the medium and its great usefulness in fields other than entertainment. (See also ADVERTISING; ATOMIC ENERGY; FEDERAL COMMUNICATIONS COMMISSION; HUMOUR OF 1952; MARINE BIOLOGY; MOTION PICTURES; RADIO.) (G. L. Bs.)

Other Countries.—Rapid progress was made during 1952 in the spread of television through western Europe. Radiodiffusion et Télévision Françaises opened a second station at Lille and began work on a new transmitter at Strasbourg. The experimental service in the Netherlands was developed further. The greatest advance was made in northwest Germany, where Nordwestdeutscher Rundfunk completed a network of five transmitters, including one at Berlin. Radio Italiana began a public television service during the summer, thus initiating a five-year plan for a nation-wide network. Plans were also laid for television services to start in Belgium and Switzerland in 1953. Only in such countries as Norway, Sweden and Portugal, where the physical nature of the country presented serious technical and financial obstacles to the operation of television, was little progress made. Except in the U.S.S.R., where a regular service was in operation from stations at Moscow, Leningrad and Kiev, no advance was made in eastern Europe. An almost universal feature of television services in the planning stage in all parts of Europe was the adoption of a 625-line standard of definition. Of the two countries which had a fully established service, however, France continued to employ an 819-line standard and Great Britain a 405-line standard.

In Britain television transmitters at Kirk of Shotts, Scot., and at Wenvoe, Wales, were brought into operation during 1952. With them the British Broadcasting corporation's plans to provide national coverage with five main transmitters were completed. By August television was available to 78% of the population of the United Kingdom.

Programs reflected this expansion. Thus "London Town," in its third year, was joined by a program very similar in treatment, called "About Britain." There was a transmission from Glyndebourne when Verdi's *Macbeth* was performed in the opera house, in a version produced for television. Television newsreel, ranging over the whole country and abroad, was extended to five complete editions every week and maintained its place as the most consistently popular program. The funeral of George VI and the proclamation of Elizabeth II were fully covered. A series called "Special Enquiry" started in the autumn of 1952, dealing with problems of urgent national importance, but in country-wide rather than metropolitan terms.

A group of broadcasts was presented during July from Paris. Fourteen programs, varying from cabaret shows and street scenes to a visit to the Louvre, were arranged jointly by the

B.B.C. and by Radiodiffusion et Télévision Françaises. The programs were spread out over eight days and transmitted simultaneously to audiences in France and the United Kingdom. The picture was converted en route (at Cassel) from the French 819 lines to the British 405 lines.

In 1952 sales of television receivers in Great Britain outstripped sound radio sales for the first time, in spite of purchase tax at 66 $\frac{2}{3}$ % and restrictions on instalment purchase. A rate of production of 60,000 to 70,000 television sets per month was maintained in Britain during the year.

In Canada a regular television service began early in September with two Canadian Broadcasting corporation stations: CBLT in Toronto and CBFT in Montreal. A start was made on plans for a third station in Ottawa. In the initial period both stations were operating for about three hours an evening, CBFT carrying programs in French and English.

Tennessee. A south central state, 16th to enter the union, Tennessee is called the "Volunteer state." Land area 41,797 sq.mi., water area about 447 sq.mi. Population (1950): 3,291,718; rural 1,839,116, urban 1,452,602, rural farm 1,016,204; white 2,760,250, nonwhite 531,468.

The population of principal cities in 1950: Nashville (capital) 174,307; Memphis 396,000; Chattanooga 131,041; and Knoxville 124,769.

History.—The state commissioners, appointed by Gov. Gordon Browning, were in 1952: agriculture, Edward Jones; conservation, C. P. Swan; education, James A. Barksdale; finance and taxation, J. M. Dickinson; highways and public works, Herbert McKee; institutions, Houston Brown; public welfare, J. O. McMahan; insurance and banking, M. O. Allen; labour, J. L. Case; public health, R. H. Hutcheson; safety, Sam K. Neal; employment security, E. K. Wiley. Railroad and public utility commissioners elected by the people were: Hammond Fowler, John Hammer and J. B. Avery.

The constitutional officers were: James H. Cummings, secretary of state; W. N. Estes, state treasurer; Cedric Hunt, state comptroller.

During the year, the University of Tennessee Junior college at Martin became a four-year affiliate of the university. A proposed convention for constitutional amendment was approved. The Tennessee Valley authority began constructing a large steam plant to generate electricity near Rogersville in Hawkins county.

Education.—Enrolment in elementary schools in 1951 was 549,503, an increase of 1.9% over that of 1950. High school enrolment was 126,131, an increase of 4.8%. Total net enrolment in 4,432 schools was 675,634. There were 4,065 county and 367 city schools, 3,521 white and 911 Negro. The total number of teachers was 23,897.

Social Insurance and Assistance, Public Welfare and Related Programs.—In Sept. 1952 the total amount of assistance was \$3,034,307 to 82,139 cases; 59,492 old-age recipients received \$1,951,679; 53,935 dependent children received \$968,691; and 2,851 blind received \$113,938. The increase in payments compared with Sept. 1951 was 2.7%.

There were in 1951-52 seven correctional institutions in the state with expenditures of \$7,170,319. A school was maintained for the blind and deaf, three state hospitals for the insane, a home for the feeble-minded and an industrial school.

Communications.—Of the 65,392 mi. of public road in 1951, 7,862 mi. were state highways; expenditure for construction of highways was \$49,683,248. There were 3,491 mi. of railroad. As of June 1952 there were 56 civilian airports, of which 21 were commercial, 25 municipal, 1 CAA intermediate and 8 private. There were in 1951, 672,168 class A and B telephones in Tennessee, 185,075 business and 487,093 residential. Water-borne commerce on the Tennessee river in 1951 amounted to 3,748,586 short tons; Cumberland river 1,646,527 (1950); Mississippi river 22,058,140 (1950); and 2,938,258 (1950) at the port of Memphis.

Banking and Finance.—In June 1952 there were 74 national banks and 220 state banks; assets totalled \$1,710,038,000 for the national and \$643,017,221 for the state banks; deposits \$1,598,921,000 for the national banks and \$586,241,172 for the state banks. Savings and loan associations in 1951 numbered 40 with assets of \$72,077,935. Federal associations constituted 36 of these with assets of \$71,717,960.

State revenue collected for the fiscal year 1951-52 was \$180,609,405. In 1951 federal aid amounted to \$49,500,000; proceeds from bonds sold, \$12,-

Table I.—Principal Crops of Tennessee

Crop	Indicated 1952	1951	Average 1941-50
Corn, bu.	39,840,000	60,360,000	64,488,000
All hay, tons	1,264,000	1,685,000	2,114,000

400,000. Debt outstanding was \$100,197,500, an increase of \$3,507,500 during the year. Receipts increased by \$19,511,029 over 1950, expenditures by \$12,530,439. Of total expenditures of \$245,300,000, \$69,076,717 was for education, \$47,338,089 for highways, \$42,672,410 for welfare and \$22,446,324 for distribution to cities and local governments.

Agriculture.—The gross value of agricultural production in 1951 was \$630,332,000; cash farm income \$522,889,000. Cash income from crops was \$236,996,000, from livestock \$278,887,000 and from government payments \$7,006,000. The value of home consumption was \$107,443,000. The forest area was 12,641,000 ac.

Manufacturing.—According to the 1947 census of manufacturing, 3,346 manufacturing plants employed 221,454 persons, wages and salaries being \$473,211,000. Value added by manufacture was \$957,539,000, led by chemical industries \$162,578,000, food \$132,489,000 and textiles \$121,294,000. (C. E. A.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Tennessee in 1949 and 1950, whose value

Table II.—Mineral Production of Tennessee

Mineral	1950 (In short tons, except as noted)		1949	
	Quantity	Value	Quantity	Value
Barite	?	?	13,000	\$ 137,000
Cement (bbl.)	6,663,000	\$14,683,000	5,993,000	12,858,000
Clays	787,000	3,094,000	624,000	2,399,000
Coal	5,070,000	27,360,000	4,172,000	21,895,000

exceeded \$100,000. Data for 1951 were not yet available. Tennessee ranks 1st among the states in the production of pyrite and 2nd in phosphate rock, and stands 26th in value of mineral output, with 0.76% of the U.S. total.

Tennessee Valley Authority. The demand for power for national defense, and particularly for expanded operations at the U.S. Atomic Energy commission's plants at Oak Ridge, Tenn., and Paducah, Ky., was the major factor leading TVA to embark upon a vast expansion of electric generating capacity which would bring the installed capacity of the system to more than 9,600,000 kw. early in 1955. Installed capacity at the end of 1952 was 4,664,000 kw., of which more than 1,100,000 kw. had been added during the year.

The congress provided funds to commence construction of 2,781,000 kw. of new capacity, chiefly in steam-electric generating stations; of this, 1,710,000 kw. was earmarked to supply power for the atomic energy plants. It included two new steam plants, John Sevier and Gallatin, bringing to seven the number of steam plants TVA had under construction. Six additional generating units were approved for Shawnee steam plant, being built to supply the Paducah Atomic Energy commission plant; with a total installation of 1,350,000 kw. in ten units, this would be the largest steam-electric generating station in the U.S.

The integrated system, which includes hydro plants of the Aluminum Company of America on the Little Tennessee river and the U.S. army engineers on the Cumberland river, generated about 20,000,000,000 kw.hr. in the fiscal year 1952, and additional power was obtained through purchase and interchange.

TVA's total operating revenues were \$95,000,000 and net operating revenues were \$25,839,000, representing a return of

WORKMEN CHANGING SHIFT at a steam-generating plant being built by the Tennessee Valley authority to furnish electric power to an atomic energy installation under construction at nearby Paducah, Ky., in 1952

4.7% on the net average power investment. Combined revenues of the 96 municipal and 50 co-operative systems which distribute TVA power totalled \$103,000,000 and net income was \$17,400,000. They sold 8,900,000,000 kw.hr. of power to 1,226,000 consumers.

No major floods occurred on the Tennessee during the first three quarters of the year, but reduction of a relatively minor crest on the Ohio river in March was estimated to have averted \$400,000 in flood damages. Estimated savings in flood damages since TVA commenced operation had amounted to \$51,266,000, while TVA flood control costs amounted to \$22,200,000. Recreation improvements and equipment on TVA lakes were valued at \$31,300,000 at the end of 1951, compared with \$12,400,000 in 1947. At its chemical plants TVA produced 14,800 tons of fused tricalcium phosphate, 32,500 tons of calcium metaphosphate, 132,200 tons of concentrated superphosphate and 197,200 tons of ammonium nitrate.

The board of directors consisted in 1952 of Gordon R. Clapp, chairman, H. A. Curtis and Raymond L. Paty. Paty was appointed by the president during the year to succeed James P. Pope, who retired upon completion of his term of office. (See also DAMS; ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.)

(K. R. K.)

Tennis. Australia with its winning Davis Cup trio, Frank Sedgman, Ken McGregor and Mervyn Rose, dominated the tennis scene in 1952. After their Davis Cup victory over the U.S. in the 1951 challenge round at Sydney, the Australian players captured all but one of the major singles titles, won three of the four most important international doubles championships and shared in the fourth.

Only Sedgman's defeat by Jaroslav Drobny, exiled Czech, in the final of the French championship and the loss by Sedgman

and McGregor of their U.S. doubles title to their Davis Cup teammate Rose and Vic Seixas, top U.S. player, prevented a clean sweep of the world's foremost tennis events by the Aussies.

In January McGregor captured the Australian title, defeating Sedgman in the final. Later in Europe, Sedgman, after his loss to Drobny at Paris, avenged that setback by defeating Drobny for the Wimbledon title. In September at Forest Hills, N.Y., Sedgman successfully defended his championship, beating a tired 38-year-old Gardnar Mulloy easily in the final, 6-1, 6-2, 6-3.

Two surprises marked the season's performance by the U.S. players. One was Richard Savitt's failure to maintain the pace he set the year before when he won the Australian and Wimbledon titles. The other was the unusual record of Mulloy, who after 18 years of striving, reached the final round of the U.S. singles championship for the first time. Mulloy won a number of U.S. tournaments and the Pan-American singles in Mexico in October in addition to scoring victories for the U.S. in Davis Cup play against Japan and Cuba, serving as playing captain in the latter match.

After defeating Japan and Cuba, the U.S. won the American zone final against Canada and thus qualified for the interzone final to be played in Sydney, Austr., Dec. 18-20, 1952. The U.S. team for Australia was to include Seixas, playing captain; Straight Clark, Hamilton Richardson and, if made available by the navy, Tony Trabert.

Altogether 29 nations challenged Australia for the Davis Cup. Twenty-three nations competed in the European zone, the winner being Italy. Only one challenger, India, entered the newly established Eastern zone. These two nations were to meet in Brisbane, Austr., Dec. 11-13 and the winner would face the U.S. the following week for the right to meet Australia in the challenge round at Adelaide, Austr., Dec. 29-31.

The U.S. women players, led by 17-year-old Maureen Connolly, again ruled women's tennis. The U.S. Wightman Cup team of Miss Connolly, Doris Hart, Shirley Fry and Louise Brough, captained by Mrs. Richard (Midge) Buck, journeyed to England and once again defeated the English team of Mrs. Jean Walker-Smith, Mrs. Jean Quertier Rinkel, Mrs. Joy Gannon Mottram, Susan Partridge, Pat Ward and Helen Fletcher, captained by Mrs. D. C. Shepherd-Baron. Miss Connolly, playing in the English championships for the first time, won the singles title at Wimbledon, defeating her teammate Miss Brough, a three-time Wimbledon singles champion. Returning to the U.S., Miss Connolly repeated her 1951 victory at Forest Hills. The young champion defeated Miss Hart rather easily in the final after a stubborn fight with Miss Fry in the semifinal round. Miss Hart, who won the French championship and Miss Fry, who was runner-up, proved invincible in doubles, retaining their French, Wimbledon and U.S. titles. Miss Hart also was a triple winner in mixed doubles with Sedgman. For the second successive year they won the French, Wimbledon and U.S. championships.

(E. S. Br.)

Terramycin: see CHEMISTRY; CHEMOTHERAPY.

Texas. A west south central state of the United States, Texas was admitted to the union by annexation Dec. 29, 1845; it is known as the "Lone Star state" from the single star in the flag of the Texas republic, 1836-45. Land area, 263,513 sq.mi.; inland water, 3,826 sq.mi.; total 267,339 sq.mi. Population (1950 census) 7,711,194, which was 20.2% greater than in 1940; (est. July 1, 1951, 7,991,000). Urban population, 4,838,060 or 62.7%; rural, 2,873,134 or 37.3%. Total white population (preliminary) 6,825,000 or 88.5%; nonwhite 886,000 or 11.5%. Capital: Austin, with 132,459 population in 1950. Other cities ranked by population in 1950: Houston 596,163;

Dallas 434,462; San Antonio 408,442; Fort Worth 278,778; El Paso 130,485; Corpus Christi 108,287; Beaumont 94,014; Waco 84,706; Amarillo 74,246; Lubbock 71,747; Wichita Falls 68,042.

History.—Political interest in 1952 centred principally in the issue of federal or state ownership of the tidelands (submerged coastal lands) claimed by Texas as part of its public-school domain. Because of Pres. Harry S. Truman's veto of a congressional resolution quitclaiming these lands to the states, much opposition was aroused. Incumbent Gov. Allan Shivers, antiadministration, won in the Democratic primary over Ralph Yarborough, proadministration, 829,829 to 485,652. Tom Connally, who had served as United States senator since 1929, did not stand for re-election. State Atty. Gen. Price Daniel, antiadministration, defeated Rep. Lindley Beckworth of the 3rd congressional district, proadministration, 936,875 to 284,967. Democratic nomination to a state office in Texas is tantamount to election. The state Democratic convention in Amarillo was controlled by the anti-Truman forces which first proposed to nominate Gen. Dwight D. Eisenhower on a "Texas Democratic ticket" but did not do so because of legal obstructions; however, it officially recommended support of General Eisenhower for the presidency. Two constitutional amendments adopted by the legislature in 1951 were voted on and approved by the people on Nov. 4, 1952. One set up a state medical education board and a state medical scholarship fund; and the other permitted cities, towns and villages to provide workmen's compensation insurance.

The principal state officials for the biennium beginning Jan. 1, 1953, and ending Dec. 31, 1954, were: governor, Allan Shivers; lieutenant governor, Ben Ramsey; attorney general, John Ben Shepperd; comptroller of public accounts, Robert S. Calvert; treasurer, Jesse James; state commissioner of education, J. W. Edgar; commissioner of agriculture, John C. White; commissioner of the general land office, Bascom Giles.

Education.—The public-school system during 1952-53 consisted of 959 independent and 1,178 common school districts, according to the state department of education. The census of total scholastics, ages 6-17, showed 1,633,911. The department's October estimate of enrolment for 1952-53 was 1,511,367; estimated average attendance, 1,277,281; estimated number of high school graduates, 44,171. The state's per capita apportionment, 1952-53, was \$66 or a total of \$107,838,006; equalization fund and other contributions of the state (est.), \$213,500,000; local contributions (est.), \$107,500,000, exclusive of servicing bonded debt. Number of classroom teachers (1951-52) was 54,340; average teacher's salary, \$3,222.

Social Insurance and Assistance, Public Welfare and Related Programs.—Average monthly payments for the fiscal year ended Aug. 31, 1952, were as follows: \$7,335,815.56 to 220,490 old-age assistance recipients for an average of \$33.27; \$226,492.81 to 6,061 aid to the blind recipients for an average of \$37.37; \$833,356.50 to 16,709 aid to dependent children families on behalf of 48,249 children for an average of \$49.87 per family or \$17.27 per child. Total expenditures for public welfare for all purposes from the state budget for the fiscal year ended Aug. 31, 1952, were \$124,864,066.

Transportation and Communication.—Texas public road mileage Oct. 1, 1952, was 108,603; state-maintained, 46,756, and county-maintained, 151,847. Expenditures from the highway fund for the fiscal year ended Aug. 31, 1952, totalled \$132,430,788. Motor vehicle registration, 1952 (prelim.), was 3,252,000. There were 15,500 mi. (est.) or first main-line railway track and 6,200 mi. (est.) of auxiliary track in Texas as of Jan. 1, 1952, according to the state railroad commission. Eleven air lines were serving Texas Oct. 1, 1952. There were approximately 620 airports of all classes. Total number of telephone stations in operation, Oct. 1, 1952, was 2,097,353. There were 215 radio stations in Texas Oct. 1, 1952, including 185 AM, 24 FM and 6 TV.

Banking and Finance.—State government receipts for the year ended Aug. 31, 1952, were \$682,835,693; total expenditures, \$592,260,809. Principal receipts were from gross receipts and production (largely petroleum) taxes, \$160,157,763; highway motor fuel tax, \$120,244,040; ad valorem tax, \$24,256,967; cigarette tax, \$35,284,873; automobile licences, \$36,064,861. Principal expenditures were for education, \$238,961,576; highways, \$132,430,788; public welfare (pensions), \$124,864,066; charitable and correctional, \$31,251,696. The state's bonded debt was \$104,100,000; total debt of all civil subdivisions, 1949, was \$948,862,623.54. On Jan. 1, 1952, there were 443 national and 463 state banks; total 906. National bank deposits were \$6,501,343,000 and resources \$6,951,848,000. State bank deposits were \$1,513,998,000 and resources \$1,628,720,000. Total bank deposits \$8,015,341,000; total resources \$8,580,568,000.

Agriculture.—Harvested acreage of 1952 crops (Oct. 1 report of the U.S. department of agriculture) was 22,329,000. A severe drought extending throughout the summer cut down acreage and limited production of most crops.

The number and value of livestock on farms, Jan. 1, 1952, were as

Table I.—Leading Agricultural Products of Texas

Crop	Indicated 1952	1951	Average 1941-50
Cotton lint, bales	3,600,000	4,074,000	3,020,000
Cottonseed, tons	1,620,000	1,833,300	1,730,000
Wheat, bu.	40,380,000	17,307,000	60,347,000
Sorghum for grain, bu.	38,038,000	71,085,000	79,096,000
Corn, bu.	39,117,000	42,143,000	56,861,000
Rice, 100-lb. bags	13,402,000	12,408,000	8,668,000
Peanuts, lb.	90,500,000	118,300,000	317,066,000
Hay, tons	1,442,000	1,456,000	1,550,000
Flaxseed, bu.	978,000	75,000	737,000
Oats, bu.	21,952,000	8,145,000	28,263,000
Barley, bu.	900,000	518,000	3,649,000
Tomatoes, bu.	1,750,000	2,030,000	2,227,000
Potatoes, bu.	2,040,000	2,204,000	4,402,000
Sweet potatoes, bu.	1,740,000	1,365,000	4,855,000
Pecans, lb.	33,000,000	5,700,000	30,415,000
Peaches, bu.	346,000	696,000	1,327,000

Source: U.S. Department of Agriculture.

follows: all cattle, 8,940,000, valued at \$1,314,180,000; milk cows only, 1,053,000, valued at \$205,335,000; hogs 1,645,000, valued at \$35,532,000; sheep, 6,176,000, valued at \$114,706,000; goats, 2,099,000, valued at \$18,051,000; horses, 321,000, valued at \$9,309,000; mules, 96,000, valued at \$2,880,000; chickens, 22,992,000, valued at \$27,590,000; turkeys, 549,000, valued at \$3,184,000. Total net value, all livestock, was \$1,525,432,000.

Manufacturing.—Total number of wage and salary workers in the manufacturing industries in Aug. 1952 was 421,200, according to the Texas employment commission. Of these 199,600 were in durable goods industries and 221,600 in nondurable goods industries. Principal employment in durable goods industries was as follows: transportation equipment, 53,700; machinery, except electric, 32,400; lumber and wood products, 31,900. In nondurable goods: food, 61,700; petroleum products, 47,800; chemicals, 36,000. Increase in industrial employment from 297,053 in 1947 (last census) to 421,200 in 1952 indicated an increase from \$1,727,464,000 value added by manufacture in 1947 to \$2,450,000,000 in 1952.

(S. McG.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Texas in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Texas ranks first among the states in the production of petroleum, natural gas and sulphur, is third in gypsum and cement and has the only commercial production of helium in the world. Texas stands first among the states in the value of mineral production, with 22.55% of the U.S. total, by virtue of an output of petroleum and natural gas that accounts for well over 90% of the state total.

Table II.—Mineral Production of Texas

(In short tons, except as noted)

Mineral	Quantity	Value	Quantity	Value
	1949		1950	
Cement (bbl.)	14,742,000	\$33,409,000	17,282,000	\$39,678,000
Clays	1,235,000	3,002,000	1,454,000	3,577,000
Coke	497,000	?	686,000	?
Gypsum	843,000	2,179,000	1,076,000	2,772,000
Helium (000 cu. ft.)	52,000	689,000	81,000	1,028,000

Total	...	\$2,379,793,000	...	\$2,673,950,000

*Values for processed materials are not included in the totals.

†Values included with other minerals.

Textile Industry. United States.—The reaction of the textile industry in the United States to the outbreak of the Korean war, while generally sharp, was not prolonged. By mid-1951, it had become clear that military fibre requirements could, with few exceptions, be met without undue strain, and when civilian consumer demand slackened off at that time, the industry encountered a sharp recession from which it began to recover only in the middle of 1952.

The price reaction to the Korean war by the three principal textile fibres is shown in the table. The cotton price quoted is the average monthly ten-market price for 15/16-in. middling cotton. The wool figure refers to fine-grade territory wool, scoured basis, at Boston, while the rayon data cover 150-denier

Selected Textile Prices

(In cents per pound)

Date	Raw cotton	Raw wool	Rayon yarn
June 1950	33.8	176.0	71.0
July 1950	37.1	179.0	73.4
Dec. 1950	42.6	265.0	77.1
March 1951	45.1	370.0	78.0
June 1951	45.2	290.7	78.0
Dec. 1951	42.2	180.0	78.0
June 1952	40.4	160.0	78.0

viscose yarn.

It will be noted that all three fibre prices rose in the month immediately after the outbreak of hostilities in Korea. Wool prices skyrocketed thereafter to an all-time high of \$3.70 per pound in March 1951 but by mid-1952 collapsed to a point 9% below the June 1950 quotation. Cotton touched a high of 45.2 cents per pound in April 1951, but by June 1952 had declined to 40.4 cents, which was 20% above June 1950. Rayon, which advanced to 78.0 cents per pound in Jan. 1951, remained at that level to mid-1952 for a net increase of 10% over the pre-Korean war price. Particularly in the case of wool, the price movements corresponded closely to the military requirements for the fibre. These requirements were a much larger percentage of total wool consumption than of the other two fibres.

Fibre Consumption Trends.—Total United States consumption of the four major textile fibres (cotton, man-made fibres, wool and silk) was 6,800,000,000 lb. in 1950, 6,900,000,000 lb. in 1951, and was at an annual rate of 6,400,000,000 lb. in the first half of 1952. For comparison, 1939 consumption was 4,500,000,000 lb.

Accompanying the increase in total fibre consumption since before World War II, there was an interesting shift in the relative importance of the fibres. Thus cotton represented 80% of all fibre used by weight in 1939, the man-made fibres accounted for 10%, wool for 9% and silk for 1%. By 1951 the respective shares were 72%, 22%, 6% and nominal.

The same general consumption trend away from wool and cotton and into the man-made fibres was observable in broad weaving. Of a total of 10,100,000,000 linear yards of broad woven goods turned out in 1939, cotton fabrics were 8,300,000,000 yd. or 82%, man-made fabrics were 13%, wool 4% and silk 1%. By 1951 broad woven output had risen by 28% to 12,900,000,000 linear yd. and the fibre shares that year were cotton 79%, man-made fibre 18%, wool 3% and silk nominal.

In tire cord and fabric output, the progress of the man-made fibres was extraordinary. Total production in 1939 was 252,000,000 lb., of which rayon and nylon was only 9,000,000 lb. and the balance cotton. By 1951 the man-made fibres represented 316,000,000 lb. or 52% of total tire cord and fabric output, which was 604,000,000 lb. For the first half of 1952, rayon and nylon constituted 63% of the poundage used.

Military uses of cotton in 1951 were estimated at 368,000,000 lb. or 7½% of total consumption. Wool for military uses that year was about 170,000,000 lb. or 35% of all wool consumption, while the man-made fibre figure was 142,000,000 lb. or 9% of its consumption.

Imports and Exports.—For silk the United States is entirely dependent on imports, and about 83% of the 1951 raw wool consumed in the U.S. was obtained from sources abroad. In man-made fibres, on the other hand, only 8% of the total 1951 poundage used was imported. Imports of manufactured and semimanufactured textiles were small in relation to aggregate consumption.

United States exports of all textile products in 1951 amounted to \$1,966,000,000 in value, the bulk of these shipments being raw cotton and manufactured textiles of cotton and man-made fibres. Exports of raw wool and woollen textiles are generally very small as a percentage of the total. Exports of all man-made fibres and manufactures thereof in 1951 were valued at \$226,000,000 or 11% of the total figure.

The Textile Outlook.—After a severe recession lasting from about mid-1951 to mid-1952, the textile industry was anticipating more active business for the balance of the year and into 1953. The heavy inventories prevalent at the beginning of the downturn had been liquidated in most cases by mid-1952 and demand for goods was reported stronger. Perhaps even more im-

PLEATED ORLON and wool skirt (left) and all-wool skirt (right) shown after each had been laundered but not ironed. Orlon, a synthetic fibre developed in the laboratories of E. I. Du Pont de Nemours & Co., was first marketed in quantity in 1952

portant was the prospect of the newer man-made fibres and a consequent stimulation of aggregate demand. Apart from nylon, demand for which continued unabated, much importance for apparel purposes was attached to the acrylic fibres (Acrilan, Orlon, Vinyon N, dynel and X-51), as well as Dacron polyester fibre and the two protein fibres, Caslen and Vicara. Also significant, chiefly for nonapparel applications, were the polyethylene, polyvinyl-acetate, saran and glass fibres. (S. B. H.)

Great Britain.—The first few months of 1952 were the most difficult period for the United Kingdom textile industry since the slump of 1930-33.

The U.K. consumption of merino wool for topmaking in Aug. 1952 was 8,560,000 lb. as compared with 9,940,000 lb. in Aug. 1951 and consumption of crossbred wool was 7,200,000 lb. (6,950,000 lb.). The consumption figures for the same periods in woollen spinning were: merino 2,450,000 lb. (2,670,000); crossbred 6,410,000 lb. (7,740,000); Indian, etc., 1,190,000 lb. (1,760,000); wool noils 1,020,000 lb. (1,270,000); wool wastes 1,380,000 lb. (1,570,000); mungo and shoddy 5,050,000 lb. (6,380,000); these figures disregarded the consumption of hair, rayon and other fibres. Estimated deliveries of woollen yarn (monthly averages) for July-August-September 1952 were 22,500,000 lb. and worsted yarn deliveries for August were 12,630,000 lb., compared with 14,530,000 lb. in Aug. 1951. Deliveries of woven fabrics for the same periods totalled 25,860,000 sq.yd. (32,460,000) of which woollen cloth accounted for 15,880,000 sq.yd. (19,490,000) and worsted fabrics 9,980,000 sq.yd. (12,970,000). Workers employed in worsted spinning and weaving in August totalled 72,500, as compared with 76,800 in Dec.

1951 and woollen spinning and weaving 59,400 (62,200).

In the cotton section of the industry, total weekly average single yarn production in August was 8,590,000 lb. as against 15,910,000 lb. in Aug. 1951. In the same period cotton waste yarn production was 1,280,000 lb. (1,840,000) and production of spun rayon and mixture yarns 1,750,000 lb. (2,120,000); the totals for doubled yarn were 2,380,000 lb. (4,780,000). The production of cotton cloth was 28,800,000 linear yards (41,900,000) and rayon and mixtures 10,200,000 linear yards (14,700,000). In the same periods (Aug. 1952 and 1951) the total number of operatives in spinning and doubling was 112,300 (148,700); and weaving 114,100 (145,700). Weekly average machine activity was 17,200,000 mule equivalent spindles, as compared with 26,500,000 in Aug. 1951, and the number of looms running was 221,000 (307,000); the figures for doubling spindles were 1,340,000 (2,510,000).

United Kingdom production in August of single continuous-filament rayon yarn was 9,600,000 lb., as compared with 18,300,000 lb. in Aug. 1951 and staple fibre production was 5,700,000 lb. (11,900,000); totals 15,300,000 lb. (30,200,000). Weekly average production of filament and spun rayon woven fabrics for July was 5,320,000 linear yards, as compared with 9,710,000 linear yards in the period January-May. In the export field the position was extremely poor. Rayon staple, rayon yarn, rayon and spun rayon fabrics, mixtures, pile fabrics, ribbons, lace, etc., amounted in August to £2,710,000, as compared with £6,190,000 in Aug. 1951. In the same months the figures for cotton yarn were £970,000 (£3,110,000); cotton fabrics £5,980,000 (£12,560,000); wool tops and woollen and worsted yarns £3,500,000 (£4,850,000); woollen fabrics £3,050,000 (£4,180,000); worsted fabrics £2,460,000 (£3,360,000).

Europe.—In most countries textile production was adversely affected by the world-wide recession and exports were lower than in 1951. Belgium, the Netherlands and Italy were the first to curtail production of cotton and spun rayon yarns and piece goods.

The Federal Republic of Germany and Austria soon took similar action, followed by France. Exports from Italy revealed a marked decline.

Commonwealth.—In India there was a fall in demand during 1952 for cotton textiles and the government attempted to alleviate the situation by partly decontrolling textiles at home and lifting some restrictions on exports. Exports to the trans-shipment areas were permitted and there were no restrictions on the export of fine and superfine cloth, but the export duty on coarse and medium cloth still remained. In 1951-52 India exported a total of 804,000 tons of jute manufactures valued at Rs. 268.1 crores, compared with 649,000 tons valued at Rs. 113.8 crores in 1950-51.

In Australia more than 90 cotton spinning and weaving mills were steadily employed, as were the 170 woollen mills. Wool prices during the latter half of the year had become more stable and gave fresh impetus to world buying activities. It was announced that Australian wool growers would receive from the Joint organization about £31,200,000 sterling in profits from disposals of wartime accumulated wool. (See also COTTON; LINEN AND FLAX; RAYON AND OTHER SYNTHETIC FIBRES; WOOL.)

(A. DR.)

Thailand (SIAM). A kingdom of southeastern Asia, Thailand is bounded west and northwest by Burma, northeast and east by French Indochina and south by Malaya. Area: 198,272 sq.mi. Pop.: (1947 census) 17,442,689; (1951 est.) 18,836,000. Language: Thai (Siamese) 75%; Chinese 20%; Indian and Malayan 6%. Religions (1947 est.): Buddhist 95%, Moslem 4%. Capital (pop., 1947 census): Bangkok 1,173,-

549. Ruler, King Phumiphon Adundet (or Bhumibol Aduladej); prime minister in 1952, Marshal Luang Pibul Songgram.

History.—On June 28, 1952, a son was born to King Phumiphon and Queen Sirikit; this was the first time a son had been born to a reigning monarch of Thailand since 1893 and was therefore an occasion for general satisfaction.

A new constitution adopted following the coup d'état of Nov. 28, 1951, was brought into force on March 8 when the king formally approved it, and thus Thailand reverted to the system first adopted in 1932 under which there was a single legislative chamber, half the members being elected by universal adult suffrage and half nominated by the crown, in place of the bicameral and elective system introduced in 1946.

The elections already held in February gave the existing ministry a strong position, for of the 123 elected members of the chamber only about 40 were likely to be in opposition, while the support of the 123 nominated members was assured. The new parliament met on March 18 and six days later nominated Marshal Pibul Songgram once more as prime minister.

Thailand was affected during the year by the fall in the price of rubber, and the southern provinces were in a distressed condition; in August the government resolved to make a grant of 5,000,000 baht to assist the rubber industry. A number of plans for developing the country's economic resources were formulated during the year; according to the press, loans totalling 3,000,000,000 baht (about \$166,000,000) were sought from the International Bank for Reconstruction and Development, for electric power projects, irrigation, extension of the railway system, harbour development, modernization of mines and development of new mineral resources.

The government maintained its co-operation with the United Nations and the western powers, and the Thai contingent in Korea continued at full strength. Diplomatic relations were resumed with Japan, and a Japanese embassy was established in Bangkok on April 28. Internally, however, a certain amount of Communist agitation continued, almost exclusively among the large Chinese population, and this unrest was strengthened by resentment against the raising of the alien registration fee from 20 to 400 baht a year.

An effort was made to send delegates to the peace conference at Peking in September, but the authorities refused to issue passports.

(B. R. P.)

Education.—Schools (1951): government 364, pupils 81,340; local public and municipal 18,581, pupils 2,660,492, teachers 72,281; private 1,279, pupils 267,442. Universities 5, students 10,557.

Finance and Banking.—Budget: (1951 est.) revenue 2,500,000,000 baht, expenditure 2,499,000,000 baht; (1952 est.) revenue 3,055,000,000 baht, expenditure 2,749,000,000 baht. Currency circulation (Dec. 1951): 3,782,000,000 baht. Bank deposits (Dec. 1951): 1,517,000,000 baht. Monetary unit: baht or tical with an official exchange rate of 35 bahts to the pound sterling and 12.55 bahts to the U.S. dollar.

Foreign Trade.—(1951) Imports 3,713,000,000 baht; exports 4,652,000,000 baht. Main sources of imports (1949): Hong Kong 17.3%; U.S. 15.7%; Singapore 13.4%; U.K. 8.7%. Main destinations of exports: Singapore 19.5%; U.S. 15.3%; India 13.4%; Penang 9.1%. Main imports: textiles 19.4%; foodstuffs 11.7%; metal manufactures 8.3%; yarns 6.8%. Main exports: rice 50.7%; rubber 15.7%; tin and tin ore 9.7%; teak 4.1%.

Transport and Communications.—Roads (1950): 3,587 mi. Licensed motor vehicles (Dec. 1950): cars 8,500; commercial vehicles 6,570. Railways (1950): 2,032 mi.; passenger-miles (1950) 891,818,000; freight net ton-miles 298,390,000. Merchant shipping (1949): vessels of 200 tons and over, 13; total tonnage 4,709. Air transport (1950): miles flown 1,265,000; passenger-miles 11,500,000; cargo ton-miles 267,000; mail ton-miles 30,400. Telephones (1951): 6,100. Radio receiving sets (1950): 100,000.

Agriculture and Fisheries.—Main crops (metric tons, 1951 except as noted): rice 7,250,000; sugar, raw value 32,000; soya beans 12,000; sesame 9,500; peanuts (1950) 55,000; tobacco (1950) 21,300; cotton (1950) 6,000; jute (1949) 3,000; cottonseed (1950) 14,000. Livestock (Dec. 1949): cattle 5,000,000; pigs 2,000,000; buffaloes 5,000,000; horses (1951) 220,000. Meat, commercial production (1951) 70,800 metric tons.

Fisheries: total catch (1950) 150,000 metric tons.

Industry.—Electricity production in 1951, Bangkok (93% of total generation): 57,000,000 kw.hr. Raw materials (metric tons, 1951): rubber (net exports) 110,500; tin (concentrates) 10,800; cement 228,000.

Theatre. The many difficulties facing the theatre in the United States appeared to be on the increase during 1952. The shortage of new plays of merit by Americans continued to prevail, and growing production costs made formerly adventurous producers cautious. While no new native dramatist seemed to have anything very extraordinary to offer, such superior works from abroad as Sean O'Casey's *Cock-a-Doodle Dandy*, Lord Dunsany's *The Strange Lover*, various plays by Ferenc Molnar (who died in New York city, April 1, 1952), André Roussin's *The Ostrich Eggs* and Marcel Aymé's *Clérambard* were available for production. The financial risk of staging them, however, prevented their being attempted, and Eugene O'Neill, ill and unable to supervise its production, published in book form instead of presenting in the theatre his play, *A Moon for the Misbegotten*.

The New York dramatic critics complained bitterly about the state of the theatre, and George Jean Nathan declined to contribute his annual volume on the season on the grounds that the year was unworthy of record. The New York Drama Critics circle prize was awarded to John van Druten's *I Am a Camera*, a dramatization of some short stories of pre-nazi Berlin by the English novelist Christopher Isherwood, and Julie Harris as the drifting, British bohemian in this play was selected as the season's outstanding actress. The Pulitzer prize went to *The Shrike*, a drama of life in the psychopathic ward of a large Manhattan hospital, the first play by Joseph Kramm, a former radio writer. *The Shrike* was distinguished by the direction and acting of José Ferrer, whose performance as the harassed inmate was another of the year's histrionic triumphs.

Helen Hayes found a following with Mary Chase's rather maudlin, Barrie-esque fantasy, *Mrs. McThing*, and Paul Osborn's dramatization of John P. Marquand's novel *Point of No Return* with Henry Fonda, Anita Loos's dramatization of Colette's novel *Gigi* with Audrey Hepburn, and Jan de Hartog's two-character play of 25 years of married life, *The Fourposter* (all of which had opened late in 1951), proved popular at the box office. S. N. Behrman contributed a drawing-room piece, *Jane*, based on a Somerset Maugham story, and Truman Capote, turning from the novel, wrote his first play, *The Grass Harp*, a gentle comedy of small-town life in the south. Its quality was not illuminated by a poor production.

There were many importations and revivals. Rex Harrison and Lilli Palmer offered Christopher Fry's poetic comedy of autumnal passion, *Venus Observed*, and Sir Laurence Olivier and Vivien Leigh played Shaw's *Caesar and Cleopatra* and Shakespeare's *Antony and Cleopatra*. Jean Anouilh's *Eurydice*, adapted as *Legend of Lovers*, appeared and disappeared. The Drama Quartette (Charles Laughton, Sir Cedric Hardwicke, Charles Boyer and Agnes Moorehead) read the "Don Juan in Hell" sequence from Shaw's *Man and Superman* and were so successful that many other "reading" companies were formed across the nation. The American National Theatre and Academy revived O'Neill's *Desire under the Elms*, Odets' *Golden Boy* and Gertrude Stein and Virgil Thomson's *Four Saints in Three Acts*, while the New York City Center theatre revived Clemence Dane's *Come of Age*, George S. Kaufman and Edna Ferber's *First Lady*, Ibsen's *The Wild Duck*, Deval's *Tovarich* and El-

PORTABLE STAGE equipment of the Touring Players being loaded onto a truck before moving on to a new engagement in 1952. On its 8,000-mi. barnstorming tour of the season, the travelling repertory group often played in small U.S. towns never before visited by a professional company

liott Nugent and James Thurber's *The Male Animal*, the last enjoying an extended engagement. Another theatre event of note was provided by the London actor Emlyn Williams, reading from the works of Charles Dickens.

The U.S. musical comedy stage suffered from a lack of fresh material as severely as did the dramatic stage during 1952. *South Pacific*, *Guys and Dolls* and *The King and I*—all held over from previous seasons—continued to prosper, but no new musical show joined their happy company. The only other show to do so was the handsome revival of *Pal Joey*, a Richard Rodgers-Lorenz Hart musical comedy of 1940 vintage. *Wish You Were Here*, an expensive extravaganza suggested by Arthur Kober's play *Having a Wonderful Time*, found a wider public than the critics had predicted, but the revival of George Gershwin's *Of Thee I Sing*, a new edition of the celebrated Negro revue *Shuffle Along*, and *Three Wishes for Jamie* all fared badly.

(T. Q. C.)

Canada.—The Dominion Drama festival entered a new era in 1952 when it accepted commercial sponsorship to avoid collapse of the annual competition: Calvert Distillers Ltd. granted the organization \$15,000 annually toward expenses and \$2,300 toward cash awards; a Calvert trophy and \$1,000 replaced the Bessborough trophy as the festival's top award, and Calvert trophies and \$100 awards were scheduled for winning groups in regional festivals. The decision to accept commercial sponsorship created some disturbance within the festival ranks, but with a \$30,000 annual expenditure, outside financial aid became inevitable. The 1952 festival was held in Saint John, N.B., and the traditional awards were made for the last time: the Bessborough trophy (highest award) to the Ottawa Little theatre for *The Enchanted*; the Martha Allan trophy for best visual

presentation to St. John's, Nfld., players; the Henry Osborne trophy for the best male actor to E. M. Margolese of Toronto Actor's company; the Nella Jeffris trophy for the best female actor to Carmel Kemp, St. John's; the Sir Barry Jackson trophy for the best presentation of a Canadian play in the 13 regional festivals to St. Marys, Ont., Little theatre.

The fourth annual ballet festival in Toronto was a great success and encouraged the Canadian Ballet Festival association in its aim—to promote the development of public consciousness of ballet to a point where dancers could earn their living at their profession.

There was much interest in the announcement that a Shakespeare festival would be launched at Stratford, Ont.; the avowed objective was Elizabethan-style settings and the establishment of the relationships between the actor and the audience that the Elizabethan theatre knew. The project was scheduled for 1953, with the leading talent to come from England. A company of 14 actors and actresses, mostly from London, Eng., went to Newfoundland late in 1952 and organized the island's first professional theatre. (C. Cy.)

Great Britain.—In 1951 the needs and purposes of the Festival of Britain had imposed upon the British stage a severe nationalism; and in 1952, as if by natural reaction from an artificial state of affairs, it was noticeable that London seemed to have an English-speaking, rather than an exclusively English theatre. This is not merely a roundabout or picturesque way of saying that the importation of United States plays was resumed in 1952 on a more than usually lavish scale (though that did in fact happen); it is a comment on the remarkable degree to which the British and United States stages had fused themselves into one vast organization in which almost every kind of talent was interchangeable.

A striking example occurred in *The Young Elizabeth*, by Jennette Dowling and Francis Letton, which came to the New theatre on April 2 and proved one of the year's chief successes. Although the theme of this play, the stormy and dangerous years of the girlhood of Elizabeth I, was a page of English history, the authors were American and the leading lady, Mary Morris, had been born in the Fiji Islands and had made her first appearance on any stage in the British West Indies. Miss Morris, who had been doing distinguished work for years without much reward, became a popular favourite overnight.

Another actress who belonged by birth to the commonwealth and by training to the British stage but who increased her reputation during the year by appearing in plays from the U.S. was Margaret Johnston, born in Australia. She appeared first in Tennessee Williams' *Summer and Smoke* and although the play did not entirely satisfy either critics or public, Margaret Johnston's sure but delicate touch in the part of the unhappy heroine and her faculty for creating about her an atmosphere of strangeness were greatly admired. Later, in Philip Barry's *Second Threshold*, she showed her ability to play a much more formidable woman without losing her individual quality. The actress won more praise than the play. Clive Brook gave one of the year's outstanding performances as the father.

Alfred Lunt, Lynn Fontanne and Noel Coward renewed an old partnership with Coward's play *Quadrille*. Compared with his last piece, *Relative Values*, which was still running at the Savoy, critical opinion found *Quadrille* a deeply disappointing comedy. A more worthy example of dramaturgy was *Winter Journey* by Clifford Odets, in which a broken-down actor was magnificently played by Michael Redgrave, his director by Sam Wanamaker and his wife by Googie Withers. Other U.S. productions which won commendation during the year were *Red Letter Day*, *Under the Sycamore Tree*, *The Trouble-Makers* and the musicals *Call Me Madam* and *Porgy and Bess*.

The year 1952 was not a good one for those British dramatists whose interests lay wholly at home. Indeed, only five such plays of real distinction were put on during the year—Terence Rattigan's *The Deep Blue Sea*, Charles Morgan's *The River Line*, J. B. Priestley's *The Dragon's Mouth*, Christopher Fry's *The First-Born* and James Forsyth's *The Other Heart*—and of these only the first three could be accounted successes.

Anthony Sharp's *Nightmare Abbey* was an unexpectedly rewarding stage transcription of Thomas Love Peacock's extravaganza. Later in the year the Westminster housed a really good "thriller"—Frederick Knott's *Dial M for Murder*.

The year had more than its share of worthy Shakespeare revivals, though some of the Stratford performances were not up to standard. John Gielgud's production of *Much Ado About Nothing* started the year's playgoing brilliantly; and a month later the Bristol Old Vic company, visiting the parent theatre with *Two Gentlemen of Verona*, carried that seldom-seen and generally intractable play to something very like a triumph. On May 28 the Old Vic company itself staged a memorable production of another rarely seen play, *Timon of Athens*; and at the opening of the autumn season *Romeo and Juliet*, with Alan Badel and Claire Bloom as the two lovers and Athene Seyler as the nurse, proved a real achievement.

The admirable series of revivals at the Arts Theatre club continued during the year, the most interesting being Harold Brighouse's *Hobson's Choice* and the 18th-century comedy *The Way to Keep Him* by Arthur Murphy. Another play which was resuscitated during the season was Thomas Middleton's *A Trick to Catch the Old One*, which proved to have more than a little life in it. (W. A. DN.)

Tibet. A country of central Asia, north and northeast of the Himalaya, Tibet is nominally a Chinese dependency. It had been in practice independent and was the only country in the world entirely under ecclesiastical control. Area: c. 469,294 sq.mi. Pop. (1948 est.): c. 3,000,000. Language: Tibetan. Religion: Buddhist. Capital, Lhasa. Ruler, the Ling Erh ("divine child") Pamo Töntrup or Lamu Fankha, the 14th dalai lama.

History.—The first anniversary of the "liberation" of this natural mountain fortress towering above the three most populated realms of the world was celebrated at Lhasa on May 23, 1952. Both the dalai lama and the panchen lama (who reached Lhasa on April 28) sent telegrams to Mao Tse-tung thanking him for his friendly protection. A military parade took place at Lhasa in the presence of Gen. Chang Ching-wu, the Chinese civil administrator, Gen. Chang Kuo-hua, commander of the Chinese forces, and Ngabo Ngawang Jigme, representing the Tibetan administration.

Shortly before, under Chinese pressure, the dalai lama had had to dismiss Lukhang, his premier, and Lobsang Tashi, a deputy premier, who were charged with being responsible for the nationalist movement which led to Sino-Tibetan clashes in Lhasa in April. Savang Lhalu, another minister, who commanded the fortress of Chamdo (Chengtu) when Tibet was invaded in 1950, was forced to resign. In June the panchen lama left Lhasa for the monastery of Shigatse where he was to make his headquarters.

In September it was reported that the Chinese were building an airfield at Lhasa and a highway linking Lhasa with Kashgar in Sinkiang.

The governments of India and China agreed in September that the Indian mission at Lhasa should henceforth be desig-

nated the Indian consulate-general. It was also understood that the three Indian trade agencies in Tibet, at Gyantse, Yatung and Gartok (western Tibet) would continue to function, and that the small Indian army detachment would remain at Gyantse for the protection of the trade route.

Tito (JOSIP BROZOVICH or BROZ) (1892–), Yugoslav prime minister, was born on May 25 at Kumrovec, Croatia. He served in the Austro-Hungarian army in World War I, was captured by the Russians, and in 1917 he joined the Red army and fought against anti-Communist Russian armies. In 1920 he was sent by the Comintern to Yugoslavia to organize the Communist party there. From 1928 to 1934 he was imprisoned for conspiracy, and in 1937 he became secretary-general of the Yugoslav Communist party. After the Germans overran Yugoslavia in 1941, Tito organized a leftist guerrilla group which effectively harried the axis occupation forces. Yugoslavia was liberated early in 1945, and Tito, who had appointed himself marshal, became prime minister and commander in chief. On June 28, 1948, the Cominform published a statement denouncing Tito for his "hateful policy in relation to the U.S.S.R." But from a correspondence between Belgrade and Moscow published later it was possible to learn that the real core of Tito's heresy was his brand of Yugoslav patriotism. "Even though we love the U.S.S.R. we cannot love our own

country less," wrote Tito to Stalin on April 13, 1948. On Oct. 29, 1950, he paid tribute to the U.S. government, which was helping Yugoslavia in its food crisis without imposing any political obligations.

During 1951 Tito pursued his qualified approach to the west. As the Soviet propaganda campaign against Yugoslavia increased in violence, on Nov. 14, 1951, Tito and George V. Allen, the U.S. ambassador, signed at Belgrade an agreement providing that the United States would "make or continue to make available" to Yugoslavia military equipment, materials and other services. On July 6, 1952, Tito said that Yugoslavia was ready to collaborate with Greece, Turkey and Austria but would not enter into formal alliances with those countries.

On Sept. 18, in Belgrade, and four days later at Bled, Tito discussed European problems with Anthony Eden, British foreign secretary. It was learned on that occasion that Tito had remarried and that his third wife was Jovanka Budisavljevic. On Nov. 3, at the Yugoslav Communist party congress, Tito spoke for five and a half hours.

Tobacco. U.S. consumers in 1952 paid about \$5,100,000,000 for tobacco products, of which about \$1,500,000,000 was taxes. Total tobacco production in the U.S. was large, indicated at 2,234,535,000 lb., compared with 2,328,226,000 lb. (second highest on record) in 1951 and an average for 1941–50 of 1,841,869,000 lb. Most types were under acreage allocations. The 1,790,000 ac. for harvest were slightly above 1951, but the 1941–50 average was 1,630,000 ac. Yields were somewhat better than was anticipated during the drought but averaged 1,248 lb. per acre, compared with a record 1,307 lb. in 1951 and 1,124 lb. average for 1941–50.

Tobacco consumption in 1952 averaged about 12.6 lb. by U.S. civilians. Cigarette consumption continued its upward trend in 1952 to an output of about 430,000,000,000, 3% more than in 1951 and 10% more than in 1950, a daily average of ten per person over age 15. Prices were about 5% higher, and some states increased tax rates on cigarettes. Cigar consumption also increased, but use of pipe tobacco, chewing tobacco and snuff declined.

The flue-cured types of the coastal plain (class I) which are the dominant cigarette and export tobaccos totalled 1,388,848,000 lb., second only to the record 1,451,965,000 lb. of 1951—the 1941–50 average was only 1,064,300,000 lb. Average yields per acre declined to 1,234 lb., compared with a record 1,304 lb. in 1951 and an average for 1941–50 of 1,103 lb. Acreage was approximately 1,125,600, and the official support price was 50.6 cents per pound. Carry-over stocks were a record 1,731,000,000 lb., which with the 1952 crop gave a total supply of 3,120,000,000 lb., about 2.5 times the probable disappearance in 1952–53; prices in the early southern markets were higher than in 1951, but in the northern markets were below the previous year.

Table I.—U.S. Tobacco Production by Leading States

(In thousands of pounds)							
State	Indicated 1952	1951	Average 1941-50	State	Indicated 1952	1951	Average 1941-50

*Preliminary.

The fire-cured types (class II) of Kentucky and Tennessee produced a small crop of 55,812,000 lb., compared with 59,529,000 lb. in 1951 and an average for the previous decade of 72,940,000 lb. The average yield of 1,195 lb. was lower than the 1,215 lb. of 1951, but far above the 1941-50 average of 1,051 lb. The support price was 37.1 cents per pound.

The air-cured Burley types amounted to 611,470,000 lb., slightly less than 616,515,000 lb. in 1951, but far above the 500,138,000 lb. average for the previous decade. The average yield was 1,310 lb. per acre, whereas 1951 was 1,352 lb. and 1941-50 only 1,154 lb. Burley acreage was 466,800 ac. in 1951. The support price averaged 49.5 cents per pound. Stocks from previous crops were a record 1,063,000,000 lb., giving a total supply about 3.1 times probable 1952-53 disappearance.

Southern Maryland tobacco (type 32) was 39,200,000 lb., well above the 33,702,000 lb. average for 1941-50, but below the 41,600,000 lb. of 1951. Yields (800 lb. per acre) were the same as in 1951, whereas the 1941-50 average was 758 lb. Acreage was 49,000, compared with 52,000 ac. in the previous year. The price was not supported.

Dark air-cured types totalled 30,185,000 lb., less than 31,708,000 lb. in 1951 and much below the decade average of 37,161,000 lb. The average yield was 1,126 lb. against 1,197 lb. in 1951 and 1,064 lb. in 1941-50. The support price averaged 33 cents per pound.

Cigar types, wrapper, filler and binder totalled 108,840,000 lb., compared with 126,645,000 lb. in 1951 and an average for the previous decade of 133,460,000 lb. The average yield declined to 1,459 lb., whereas 1951 was 1,502 lb. and 1941-50 was 1,413 lb. There was no price support on 1952 production of these types.

The 1952 tobacco crop of the north temperate zone was forecast at 5,422,000,000 lb., 4% less than in 1951, with the decrease mostly in North America and southeast Europe, largely but not wholly to be charged to drought. World production of flue-cured types was a new record in 1951-52 of 2,377,000,000 lb., 20% more than the record of the previous year and 31% more than the average for the decade. World trade in tobacco in 1951 totalled 1,293,923,000 lb., 6% more than 1950 and 9% above pre-World War II. Increased exports by the United States, Turkey, India, Greece and the Philippines more than offset decreased amounts from Italy, Yugoslavia, Brazil and Southern Rhodesia. The U.S. exported nearly one-half the total. Leading importers were the United Kingdom (355,804,000 lb.), the U.S. (104,652,000 lb.) and the Federal Republic of Germany. (J. K. R.)

Tobin, Maurice Joseph (1901-), U.S. secretary of labour, was born in Roxbury, Mass., on May 22. He worked for the New England Telephone and Telegraph company for a number of years, served in the Massachusetts legislature, 1927-28, was mayor of Boston, 1937-44, and governor of Massachusetts, 1944-46. In 1948 Pres. Harry S. Truman appointed him secretary of labour.

During the national steel strike of 1952, Tobin supported the wage demands of the C.I.O. steelworkers union, declaring at the latter's annual convention in Philadelphia, Pa., May 14, that he was behind the steelworkers "heart and soul and spirit."

Toronto. Capital of the province of Ontario, Can., Toronto lies at the mouths of the Humber and the Don rivers on the north shore of the western end of Lake Ontario. The population in 1951 was 670,945 (1941: 667,457); the 1951 population of the metropolitan area was 1,108,532 (1941: 909,928). In 1952 the population of the metropolitan area was estimated at 1,117,470, of which 544,171 were males. The subject of unification of Toronto proper with the 12 surrounding suburban municipalities continued to be hotly debated in 1952, but the once solid suburban opposition against unity in any form had disappeared under the admission that some form of union was desirable. The debate therefore centred around outright amalgamation, unification of essential services, or piecemeal amalgamation. By Oct. 31, 1952, no decision had been reached. The draft zoning law continued to be a contentious issue. A subcommittee of the city council studying traffic movement recommended a priority schedule for street enlargements to aid the flow of traffic from congested downtown areas. The province of Ontario consented to taxation of its vast property holdings in Toronto, valued at approximately \$11,000,000. A proposal to hold the sixth referendum on the question of two-year terms for councillors was discussed; the latest previous referendum was in 1950 when the idea was defeated by 20,000 votes. The Toronto board of education budget for 1952 totalled \$23,007,816, or \$2,833,855 over 1951. Figures released in 1952 revealed that Toronto had, in 1951, 157,205 occupied dwellings, of which 97,830 were owner-occupied. There were 4,005 major industries, having 158,562 employees, earning \$369,000,000 in wages, and making \$1,579,000,000 worth of goods. (C. Cy.)

Tourist Travel. The volume of vacation travel by the people of the United States, both at home and abroad, soared to a new record peak in 1952. The American Automobile association estimated that nearly 75,000,000 persons, about half the national population, made a pleasure trip sometime during the year, spending in excess of \$13,000,000,000 in the course of their travels.

Approximately 85% of all travel was by private passenger automobile; the vacation trend was further stimulated by a rise of more than 1,000,000 in the number of automobiles in the country in 1952. There were 43,894,000 passenger vehicles registered, an increase of 2.8% over the total of the previous year. A new record was set in national park visitation during the travel year, with 41,000,000 persons exceeding the total in 1951 by 14%. Ninety-six per cent of the visitors to the national parks arrived by car.

During the first six months of 1952, the 16 motor clubs affiliated with the American Automobile association issued a total of 531,821 travel routings to their members, an increase of 13.1% over the same period of the previous year. While travel rose to all regions, the percentages varied widely. The largest increase, 47%, was to California. Other increases, by regions, were northwest, 33%; New England, 21%; south central, 19%; northeast, 17%; southeast, 15%; Florida, 12%; southwest, 11%; north central, 9%; and eastern Canada, 8%.

The widespread use of the automobile as a means of travel greatly affected the accommodations industry. The building of conventional hotels had practically ceased; on the other hand, the construction of motor courts along the highways had proceeded at a high pace and by late 1952 there were an estimated 45,000 motels in the country, compared with 25,000 hotels. Owners of motor courts expected to take in an aggregate \$1,500,000,000 from a registration of 600,000,000 persons during 1952. The A.A.A. estimated that when its members travel by automobile, 55% stop at motor courts, 27% at hotels and the balance with friends or relatives.

Travel outside the country also continued to rise to new heights. Canada, the principal foreign objective of United States travellers, drew a total of 1,759,545 visitors during the first eight months of 1952, an increase of 5.9% over the same period of 1951. Alaska travel volumes were high and it was expected that a total of 50,000 vehicles, with about 100,000 passengers, would visit the territory during 1952. The total for the preceding year was 23,406 vehicles with 43,238 passengers. Mexican officials reported that 421,317 tourists visited Mexico during 1951, spending approximately \$300,000,000. A total of 500,000 visitors was expected during 1952.

A record number of travellers, citizens returning from abroad and aliens coming from other countries, arrived in the United States during the fiscal year ending June 30, 1952, according to figures furnished by the immigration and naturalization service. The total number of passengers was 1,433,010, an increase of 11.8% over the previous high set in 1951. The number of citizens was 797,108.

More passports were issued by the state department for travel abroad than ever before. During the first six months a total of 244,860 passports was issued, an increase of 48% over the same period in 1951. The principal foreign destination was Europe; the department of commerce estimated that in 1952 Americans visiting there would spend \$250,000,000.

A new international driving treaty, promulgated by the United Nations, took effect, with ratification by five nations including the United States. It was designed to "facilitate and encourage international motor touring" by enabling motorists of signatory nations to travel freely with their home licence plates and registration documents. The A.A.A.'s International Travel department reported a record high in the number of Americans motoring in Europe, with more than 4,500 shipping their own cars abroad and several thousand others renting cars for use on arrival. (See also AMERICAN CITIZENS ABROAD; NATIONAL PARKS AND MONUMENTS.) (MI. FE.)

Town and Regional Planning. The 21st International Housing and Town Planning congress was held in Lisbon, Port., Sept. 24-27, 1952. In Africa, a plan for Lusaka, the capital of Northern Rhodesia, was being realized in 1952. In 1951 plans were made for Capetown, Union of South Africa. A plan for greater Bombay, India, was published. For Copenhagen, Den., a city of more than 1,000,000 inhabitants, a plan for the metropolitan region was drawn up. At Marseilles, Fr., progress was made on the realization of a regional plan to localize and improve industrial zones and provide slum clearance for the central area. Construction proceeded in 1952 on the Avenida Bolivar in Caracas, Venez., a mile-long, 525-ft. parkway to provide an eight-lane superhighway across the heart of the city.

In Great Britain most of the county-wide, comprehensive plans required by law were filed in 1952 with the ministry of housing and local government. In Manchester, work began on realization of a 20-year plan. The new town of Lansbury, part of which was built as an exhibit for the Festival of Britain in 1951, was to be extended as one of a series of new towns to replace east side slum conditions in London. Construction proceeded in 1952 in the new towns of Stevenage, Harlow and others.

In the United States the growing urban population made demands on cities for revised plans and stimulated the creation and activities of county planning boards to take care of the overspill across official city limits. In 1950, 63.7% of the population lived in cities compared with 45.8% in 1910. The *Municipal Year Book, 1952* reported 20 city-county planning commissions. An economic survey in Arlington county, Va., made in

MULTIDECK GARAGE in a shopping district of Beverly Hills, Calif., one of the vertical parking structures growing in popularity in 1952 as an answer to midtown parking problems in many U.S. cities

1951, led to the establishment of a large regional shopping centre.

A plan for the state capitol area of Salem, Ore., was issued by the planning commission created by the legislature in 1949. In St. Paul, Minn., where an ambitious plan for approaches to the state capitol had been realized, announcement was made of a redevelopment scheme which would redeem slum areas in the capitol area. A similar redevelopment plan was announced for Nashville, Tenn. Many redevelopment schemes were adopted in 1952. In Portland, Ore., adverse uses were to be eliminated from an established industrial area. In Philadelphia, Pa., the planning commission announced redevelopment plans for Penn centre, where the removal of the Broad Street station and elevated tracks cleared the way for new land uses. A 1952 report indicated that the Board of Architectural Review, established in Rye, N.Y., in Aug. 1951, had performed a useful service. In Virginia a portable travelling exhibit, "Planning Your Town," was circulated in the towns.

The American Planning institute held its annual meeting at Baltimore, Md., April 24-26, 1952. The American Planning and Civic association held its National Citizens Conference on Planning and Resources in Louisville, Ky., May 18-21, 1952. The chamber of commerce of the United States held its fourth National Conference on Urban Problems in Portland, Ore., June 23-24, 1952. The American Society of Civil Engineers celebrated its 100th anniversary in Chicago, Ill., Sept. 3-13, 1952, and at one session "A History of City Planning" was given by Maj. Gen. U. S. Grant, III, president of the American Planning and Civic association. The American Society of Planning Officials held its National Planning conference in Boston, Mass., Oct. 5-8, 1952. (See also ARCHITECTURE; HOUSING.)

Track and Field Sports.

Competition leading to the Olympic games was a feature of 1952, and the various records set during the United States indoor campaign were indications of what lay ahead. The mile run, with Fred Wilt and Don Gehrmann the top stars, and the pole-vaulting duels of Bob Richards and Don Laz, were highlights of the season. Wilt got away winging at New York city, Jan. 12, when he took his specialty in 4 min. 14.6 sec. to help the New York Athletic club annex Metropolitan Amateur Athletic union team honours. Manhattan college's medley relay team missed a listed world mark by $\frac{1}{10}$ sec. when it triumphed in 1 min. 53.7 sec. on a flat armoury floor. Richards lost the pole vault for the first time in 50 consecutive meets in the *Washington Star* (D.C.) games Jan. 12 when Laz went 7 in. higher to score at 15 ft. 3 in. Gehrmann took the mile in 4 min. 14 sec. and Dick Attlesley set a U.S. indoor mark of 8.3 sec. for the 70-yd. high hurdles. Horace Ashenfelter clipped the meet two-mile standard to 9 min. 5 sec. Gehrmann, Richards, Roscoe Browne and George Rhoden all set meet records in the *Philadelphia Inquirer* (Pa.) games of Jan. 18. Gehrmann spun a mile in 4 min. 10.2 sec.; Richards vaulted 15 ft. 3 in.; Rhoden took the 600-yd. run in 1 min. 13 sec.; and Browne annexed the 1,000-yd. run in 2 min. 14.9 sec. Two of the season's best feats came in the *Milwaukee Journal* (Wis.) games on Feb. 1. Richards vaulted 15 ft. 4 $\frac{1}{2}$ in., his peak for the year, and Gehrmann again beat Wilt in a 4 min. 8.4 sec. mile, his fastest of the year. A photo finish between Gehrmann and Wilt featured the New York Athletic club meet on Feb. 9, with Wilt declared the victor in 4 min. 10.4 sec. The national A.A.U. championships at New York, Feb. 16, saw Gehrmann set a new meet and U.S. record of 2 min. 8.2 sec. for the 1,000. John O'Connell of the Manhattan College Athletic association took the 60-yd. dash, then helped Vernon Dixon, Louis Jones and Robert Carty take the medley sprint crown after they had established a new U.S. time of 1 min. 52.7 sec. in qualifying. Richards, vaulting for the Illinois Athletic club, won at 15 ft.; Bill Mack of East Lansing, Mich., defeated Wilt for the mile title; and Ashenfelter, running for the New York Athletic club, won at three miles in 14 min. 2 sec. Charles Moore broke the meet mark with a 1 min. 10.9 sec. clocking in the 600 as he helped the New York Athletic club annex the team championship with 27 points. The Manhattan College Athletic association was second with 20.

Wilt moved up to the two miles for the Intercollegiate A.A.A.A. games and triumphed in 8 min. 50.7 sec. for the fastest time ever made on the North American continent. Reggie Pearman, New York university, turned in the best half-mile ever run on an 11-lap track as he upset Gehrmann in 1 min. 51.3 sec. Manhattan, with 40 $\frac{1}{2}$ points, took the team crown. Manhattan continued its record breaking and set a new Canadian mark of 3 min. 22.1 sec. for the mile relay at Hamilton, Ont., on March 8. O'Connell tied the Canadian national standard of 6.2 sec. for the 60-yd. dash and equalled the mark of 4.6 sec. for the 40.

Four championship records fell at Long Beach, Calif., June 20-21 in the 64th national A.A.U. outdoor games. Designated as semifinal Olympic tryouts, the meet drew a crack field. Walter Davis of the San Antonio Athletic club accounted for a mark with a high jump of 6 ft. 10 $\frac{1}{2}$ in., and Parry O'Brien, wearing the colours of the Los Angeles Athletic club, set a shot-put

Outstanding U.S. Track and Field Performances (Outdoor), 1952

		6,713—Richards, Illinois A.C.	
		6,628—Albans, Los Angeles A.C.	

record of 57 ft. 4 $\frac{3}{8}$ in. in defeating Jim Fuchs, who had held the old mark. Henry Laskau of the 92nd Street Young Men's Hebrew association of New York city broke a 32-year-old U.S. and meet standard when he took the 3,000-m. walk in 12 min. 52.6 sec. Curtis Stone of the New York Athletic club was the only double winner as he annexed the 5,000- and 10,000-m. runs. The former Penn State ace won the 10,000 in 30 min. 33.4 sec. to better the mark set by Wilt in 1949. Bob Mathias of Tulare, Calif., retained the national A.A.U. decathlon title, and Stella Walsh of the Dreyer Athletic club kept the women's pentathlon crown.

Catherine Hardy of the Fort Valley State college, Fort Valley, Ga., annexed the 50-, 100- and 200-m. titles in the women's national A.A.U. outdoor championships. The team title went to the Police Athletic league of New York, which also won the women's laurels indoors as Mae Faggs led the scoring with a double in the 100- and 220-yd. sprints.

Southern California retained team honours in both the Pacific Coast conference and the National Collegiate Athletic association meets, and Manhattan college added the Intercollegiate A.A.A.A. outdoor championship to the one it had won indoors. Other major outdoor team title winners included Illinois, which

EMIL ZATOPEK (left) of Czechoslovakia, leading in the last lap of the men's 5,000 m. Olympic run at Helsinki, Fin., July 24, 1952. Zatopek set an Olympic record by finishing in 14 min. 6 sec.

repeated in the Western conference; West Point, Heptagonal league; Maryland, Southern conference; Kansas, Big Seven; Alabama, Southeastern conference; Texas A. and M., Southwest; Manhattan, Metropolitan (N.Y.) Intercollegiate; Washington State, Pacific, Northern; Rhode Island State, Yankee conference; and Tufts, New England.

A number of U.S. squads toured other countries before and after the Olympics. Dillard, one of the touring stars, was awarded the John Thornton trophy by the British Amateur Athletic association for winning the 120-yd. hurdles at London in August, his time of 13.9 sec. being the fastest of the year in Britain for that event. John Disley, English steeplechase ace, gained the C. N. Jackson trophy as Britain's athlete of the year. Bill Nankeville, Eng., ran a sparkling 3 min. 49 sec. for 1,500 m., easily beating Peter Robinson of England and Gehrman at London in May. (See also OLYMPIC GAMES.) (T. V. H.)

Trieste, The Free Territory of.

Trieste is a small state at the northern end of the Adriatic sea, between Italy and Yugoslavia, demilitarized and neutral, whose integrity and independence were assured from Sept. 15, 1947, by the Security council of the

United Nations. Total area: 293 sq.mi. Total pop. (mid-1951 est.): 372,000. Military governors under provisional regime: zone A, British-U.S. (area, 96 sq.mi.; pop., 312,000), Maj. Gen. Sir John Winterton; zone B, Yugoslav (area, 197 sq.mi.; pop., c. 60,000), Col. M. Stamatovitch. Mayor of the city of Trieste: Gianni Bartoli.

History.—The history of the free territory during 1952 was particularly stormy. Toward the end of February Marshal Tito approached the question from a new angle, proposing a Yugoslav-Italian condominium by which there should be alternate Yugoslav and Italian governors of the whole territory, each holding office for three years; a Yugoslav governor would have an Italian, and an Italian governor a Yugoslav deputy. Italy rejected this proposal out of hand.

On March 20 large-scale demonstrations were organized which were primarily intended to press for the return of the whole of the free territory to Italy and to arouse sympathy for the Italians subjected to the Yugoslavs in zone B. The result, however, was that U.S.-British-Italian talks on modifications only in zone A were opened in London on April 3. In a speech to both chambers in Belgrade on March 31 Marshal Tito protested against a discussion of the Trieste question without the participation of Yugoslavia.

On May 9, nevertheless, a U.S.-British-Italian memorandum was signed which provided for the handing over of a number of administrative functions in zone A to Italians. In reply the Yugoslav military governor introduced further Yugoslav legislation into zone B.

Meanwhile elections, postponed from 1951, had been held in zone A on May 25. While 94% of the electorate voted, the percentage voting for reincorporation in Italy fell from 63% in 1949 to 62%. The proportion of Christian Democrat voters diminished from 39% to 32.5%; the administration, however, remained in mainly Christian Democrat hands. (E. Wt.)

Finance.—Budget (1951-52 est.): revenue 12,730,000,000 lire, expenditure 15,680,000,000 lire. Monetary unit: lira with an exchange rate of 1,750 lire to the pound and 62½ lire to the U.S. dollar.

Foreign Trade.—(Excluding Italy; 1951) Imports 29,776,000,000 lire; exports 9,116,000,000 lire. Main sources of imports (1951): Yugoslavia and Yugoslav zone 7.2%; Germany 5.7%; Austria 3.3%; U.S. 2.7%. Main destinations of exports: U.S. 32.8%; Yugoslavia and Yugoslav zone 39.1%; Austria 6.7%; U.K. 2.7%.

Trinidad and Tobago. This British colony consists of two islands off South America north of the Orinoco delta. Area: 1,980 sq.mi. Pop.: (1946 census) 557,970 (27,161 in Tobago); (1951 est.) 643,000 (31,000 in Tobago). Language: English, Hindu, French, Spanish. Religion: Christian 70%; Hindu 23%; Moslem 6%. Chief towns (pop. 1950): Port of Spain (cap., 105,700); San Fernando (32,870). Governor in 1952, Major General Sir Hubert Rance.

History.—Extremes of wet and dry weather caused the 1952 sugar crop to fall some 25,000 tons below the estimated 165,000 tons. The year's cocoa crop, at an estimated 12,000,000 lb., was 8,000,000 lb. less than the previous year. The United Kingdom government made a Development and Welfare grant of 500,000 British Caribbean dollars toward the cost of a land settlement scheme. A department of co-operative development was established. In May, four of the bases leased to the U.S.A. were provisionally handed back to the colony, 22,000 ac. thereby becoming available for cultivation. New installations at the oil field at Point-a-Pierre, completed in August at a cost of \$24,000,000, included the colony's first catalytic cracking plant. A large cotton mill and a knitwear factory were opened during the year.

Legislation was passed to vest executive powers of local government in the colony's county councils.

The cost of living continued to rise, and a permanent com-

mittee was set up to study the question. Prices calculated at 100 in January, had risen to 106.6 in August.

A colony-wide attack on tuberculosis by means of B.C.G. vaccination was undertaken with the help of the U.N. International Children's Emergency fund. During the two-year campaign 400,000 persons were to be examined and about 250,000 vaccinated.

Education.—Pupils enrolled (1951): elementary 120,847; secondary 5,882. Government expenditure, B.W.I. \$5,344,000.

Finance and Trade.—Monetary unit: British Caribbean dollar, valued at U.S. \$.58½. The following data are in British Caribbean dollars. Budget (1952 est.): revenue \$56,115,000; expenditure \$60,384,500. Foreign trade (1951): imports \$218,639,400; exports incl. re-exports \$214,746,700. Production (1951): petroleum 20,843,000 bbl.; asphalt 154,705 tons; rum 2,277,000 proof gal.; cocoa (delivery for export) 7,705 tons. Sugar crop (1952) 140,724 tons. (P. H.-My.)

Trolley Coaches: see ELECTRIC TRANSPORTATION.

Tropical Diseases. **Malaria.**—The extensive use of residual insecticide sprays such as DDT had demonstrated the biologic and economic feasibility of nation-wide programs to eradicate malaria. In Ceylon, for example, where such a program was started in 1946, the death rates which ranged from 854 to 880 per 100,000 during the period from 1940–46 were reduced to 215 per 100,000 in 1950.

The adaptation of the parasites of falciparum (aestivo-autumnal or malignant tropical) malaria to man apparently is less complete than is that of vivax (simple tertian) malaria. In the former infection the stages of the parasite in the tissues, developing immediately after inoculation by an infected anopheline mosquito, either disappear or become nonfunctional after producing the first brood of forms in the circulating blood. These forms are produced only once in the course of any given infection. Definitive cure, therefore, may be obtained by appropriate treatment of the acute clinical attack. With vivax malaria, on the other hand, the tissue stages persist and give rise to successive broods of the blood forms at intervals which account for the periodic relapses of the disease.

Important advances were made in treatment, especially of vivax malaria. In this infection definitive cure is dependent upon elimination of the tissue forms which are responsible for the successive broods of blood forms producing the relapses. Chemical compounds belonging to the 8-aminoquinoline group were found to be effective against the tissue forms. One of these, primaquine, was shown to be sufficiently active and with low enough toxicity to warrant extensive clinical use. Neither this preparation nor the related compounds, however, are active against the blood forms of the parasite. Chloroquine (Aralen) is the drug of choice against the latter and is, therefore, the preferred drug for the treatment of acute vivax malaria. Definitive cure of vivax malaria was achieved by the combined use of chloroquine and primaquine. The former drug continued to be the most effective agent for suppressive treatment.

Yellow Fever.—The recent extension of jungle yellow fever into Central America called attention to the potential danger of "yellow jack" in the western hemisphere. In 1948 and 1949 fatal cases of the disease were identified in Panamá. The following year the first case on the Atlantic side of the isthmus was reported, and in 1951 a case was found at Almirante, well up the Atlantic coast. Yellow fever also appeared in epidemic form in two localities on the Atlantic side of Costa Rica. Mouse protection tests using the blood from wild monkeys showed that 12% of the animals examined in the state of Chiapas, Mex., were immune to the infection, and consequently that the virus of jungle yellow fever is present in the forest areas of that region.

The occurrence of an epidemic of jungle yellow fever in 1951 among new settlers in the state of Goiás, Braz., with about

2,000 cases and several hundred deaths emphasized further the importance of this disease as a public health problem. It constituted a permanent potential source of the virus for the infection of towns and cities harbouring the vector mosquito *Aedes aegypti*. It had become abundantly apparent that protection against the classical urban yellow fever epidemics of the past century depended upon constant and continuing efforts directed to the vaccination of exposed populations and the eradication of the *Aedes aegypti* mosquito in all towns and cities situated in close proximity to forests in which the infection is known to exist.

Schistosomiasis.—The demonstration of an endemic focus of schistosomiasis in Santo Domingo constituted further evidence of the increasing public health problem which this disease presents.

The dinitrophenol compounds are the most effective molluscicides for the eradication of these intermediate hosts. Although they are toxic to fish and other aquatic life, they do not appear to be harmful to domestic animals in the concentrations required for control operations. Such operations, however, must be conducted over a considerable period of time. It was shown that even after a series of applications of the chemical a few snails remain and in the absence of continued treatment these can soon repopulate the area.

Filariasis.—Additional evidence had been accumulated to indicate that the severe complications of filariasis such as elephantiasis depend upon constantly repeated infections over a prolonged period of time. The severity of the resulting disease appears to be related to the total number of adult filarial worms in the patient's body, and the number of microfilariae in the circulating blood is not necessarily an index of the intensity of such infection.

Further studies conducted in the Society Islands demonstrated the value of hetrazan both for treatment and control of spread of the infection. The drug significantly reduced the prevalence of microfilaria-positive blood films, and greatly reduced the numbers of microfilariae in the blood of patients who remained positive after treatment. However, hetrazan did not appear to reduce the frequency or severity of clinical filariasis.

The eradication of filariasis was shown to depend upon effective co-ordination of treatment of infected individuals, sanitation and the use of insecticides to eliminate the mosquitoes responsible for the spread of the disease.

Onchocerciasis.—In onchocerciasis, the blinding filarial disease of Africa and the coffee-growing regions of Guatemala and Mexico, hetrazan did not prove to be as effective as had been hoped. Although the drug caused the microfilariae to disappear for a time, this effect was temporary and it did not appear to affect the adult worms. When typical nodules in the skin were removed surgically three to six months after treatment, little if any damage to the adult worms was demonstrable.

A new drug, suramin, appeared to have greater promise. Injection of this preparation into the blood stream of infected individuals was shown to be followed by death of the adult filarial worms.

Leprosy.—The introduction of the sulphones for the treatment of leprosy had brought about a profound change in the prognosis of the disease. Prior to this new treatment the patient suffering from the malignant lepromatous type of the disease had to be isolated. Now he may continue his work while undergoing therapy.

Two preparations received particularly favourable comment: DDS (diaminodiphenyl sulphone) and Diasone (sulfoxone sodium). Analysis of the results obtained in the treatment of 1,430 cases with the latter drug showed improvement in 74.8%. While all stages of leprosy were benefited, progress was more

favourable when therapy was started early.

The sulphones are likewise considered important in the control of the disease, since they cause rapid healing of ulcers of the skin and mucous membranes and prevent to a large extent shedding of bacilli from the body. (See also CHEMOTHERAPY; WORLD HEALTH ORGANIZATION.)

Truman, Harry S. (1884–), 33rd president of the United States, was born at Lamar, Mo., on May 8. (For his early career, see *Encyclopædia Britannica*.) He was elected to the U.S. senate in 1934, and re-elected in 1940. Elected vice-president in 1944, he became president on the death of Franklin D. Roosevelt on April 12, 1945. He was elected president on Nov. 2, 1948.

Truman surprised Democratic party leaders on March 29, 1952, when he said at a Jackson-Jefferson dinner at Washington that he would not seek re-election. At the Chicago convention in July he threw his support to Gov. Adlai E. Stevenson of Illinois, and after the latter received the nomination, Truman campaigned for him vigorously, travelling an estimated 18,000 mi. and making more than 200 speeches.

Foreign affairs continued to be a major problem for the president in 1952. Despite protracted armistice negotiations, the Korean war dragged on and the toll of United States casualties continued to mount. In his state-of-the-union message to congress, Truman declared that a world war still threatened, and about \$50,000,000,000 of his \$85,000,000,000 budget was allocated to national defense. In his October campaign speeches, however, he said that the balance was swinging in favour of the "free world" and that the probability of actual conflict had become more remote.

Truman's Fair Deal legislative program suffered its usual fate on Capitol Hill, no major proposal of his being enacted. Amid sharp controversy, congress overrode his veto of the McCarran-Walter act, which tightened immigration laws and continued the

existing basis of national origin quotas. The administration's alleged softness toward Communists and fellow-travellers was cited as evidence of need for this legislation and for stricter security tests. Truman also vetoed a measure vesting ownership of tidelands in the states, and this assertion of federal authority, which was upheld in the senate, became an issue in the presidential campaign.

Congressional exposure of corruption and political favouritism in several executive departments, notably the Justice department, Internal Revenue bureau and the Reconstruction Finance corporation, forced a cabinet shake-up. Although Truman had approved the appointment of Newbold Morris of New York as an outside investigator and clean-up man, Morris was summarily dismissed by Attorney General J. Howard McGrath in a disagreement over a questionnaire concerning the income of justice department officials. Truman immediately requested McGrath's resignation, and replaced him with Judge James P. McGranery of Philadelphia, Pa.

Labour troubles beset the White House when, in March, the Wage Stabilization board recommended a wage increase and union shop for striking C.I.O. steel workers. Charles E. Wilson, director of the Office of Defense Mobilization, criticized the recommendation as an inflationary threat and, when Truman upheld the board, he resigned. He was succeeded by Henry H. Fowler, former head of the National Production authority. As the strike continued, Truman ordered federal seizure of the steel plants under what he called the "inherent powers" of the presidency. In a sharp judicial rebuke, Judge David Pine of the U.S. district court at Washington held this action unconstitutional, and he was upheld by the U.S. supreme court in a 6 to 3 decision. Several impeachment resolutions were introduced in the house during this controversy.

A similar predicament arose to embarrass the Democrats during the fall campaign. After John L. Lewis, United Mine Workers president, had won a \$1.90-a-day increase for his men from the coal operators, the Wage Stabilization board reduced it to \$1.50. When the miners walked out in protest, Truman invited Lewis to the White House, and arranged for resumption of work pending a final settlement.

Truman's plans for his future career were indefinite, although he frequently expressed a desire to write, lecture and teach on behalf of world peace. He warned that he would always take an active interest in politics, for, as he once said, "I am a politician and proud of it!" (See also ELECTIONS, U.S.; POLITICAL PARTIES, U.S.; UNITED STATES.) (R. Tu.)

Trust Territories. These include former German colonies and islands which became mandates after World War I and trust territories after World War II; South-West Africa, which remained mandated; and the former

Italian Somaliland which became a trust territory with Italy administering on April 1, 1950. Total area: 1,231,972 sq.mi.; total population c. 20,174,000.

History.—In 1952 the United Nations Trusteeship council had to hold three separate sessions, in order to carry out its duty of supervising, by means of comprehensive and continuous study, the political, educational and social development of 11 trust territories, presenting extraordinary differences in stages of civilization, climate and economic resources. The reports of visiting missions, the annual reports of the administrations, the actual presence of experts from all the trust territories to answer questions and give full information, the growing number of petitions all combined to make the trusteeship council a body possessing immense experience, and able to speak with unique authority on the whole range of questions involving the future of these vast and in many cases backward areas.

A particularly urgent case seemed to be Somaliland. There conditions were unusual. Italy, the administrative power, was not yet a member of U.N. and was being assisted by a U.N. advisory council; within a fixed period of eight years the country was to achieve independence. Careful consideration was given to the annual and visiting mission's reports and a large number of recommendations were made emphasizing the urgency for taking further steps toward the integration of the Somalis, of whom a majority were still nomadic, into the territory's social and economic life.

The wide range of far-reaching problems with which the trusteeship council was faced and their bearing on the trusteeship system as a whole, can be appreciated by the following examples. In the Pacific Islands the most urgent task was to create a sense of unity in 96 scattered islands, with a great variety of indigenous peoples and languages. A secondary task was to plan for the economic future of an area where resources were dwindling. The same planning for the future was necessary in the case of the smallest trust territory, Nauru, whose phosphates, the sole source of wealth, would be exhausted in 70 years. In Western Samoa real progress had been made toward self-government and the problem was becoming one of more education both at home and abroad. In New Guinea, the most backward of the trust territories, the urgent need was to bring the whole area under administrative control. In Tanganyika where a small population was spread over a vast area and where conditions of soil and climate showed extraordinary extremes, it was an immense task to promote the territorial consciousness, necessary for the attainment of real independence. A remarkable point in the administration's annual report was the adoption of measures aiming at the improvement of conditions for women and the removal of the load of taboos. In Ruanda-Urundi, where the year's record of the administration (Belgian) won special commendation from the trusteeship council, the duality of the territory and the survival of some of the old hostility between the two parts still remained problems to be solved.

Two larger questions, already considered at earlier sessions of the trusteeship council, came up for review. They involved the pooling of certain administrative services in Ruanda-Urundi and those in Belgian Congo, and of similar services in Tanganyika and those in Kenya and Uganda. The council approved the benefits derived from this interstate co-operation which in their view involved no political fusion whatever. In two instances the council singled out for commendation the raising of funds by the administration of a territory for special purposes: these were the native welfare fund for economic and social development in Ruanda-Urundi and the trust fund for meeting the changes in the economic situation of Nauru in the near future.

The trusteeship council also took occasion to tighten up its

own machinery. In one case more effective methods for dealing with petitions were worked out. A special committee was set up to examine petitions both before and during the council's sessions, in two stages: a preliminary stage dealing with the facts and further information if required, a second for more final examination and recommendation of action by the trusteeship council as a whole. In another, a special committee was set up to improve the functioning of the periodic visiting missions, one of the most important innovations of the trusteeship system. Trust Territory of the Pacific Islands: see MARSHALL, CAROLINE AND MARIANA ISLANDS.

Tuberculosis. *Diagnosis.*—Never before was so much tuberculin testing in humans reported as during 1952. Among 41,815 tested in Manila, Phil., from 43% to 61% of first grade school children and 100% at the age of 18 reacted. In Israel, testing of 365,298 from birth to 30 years of age revealed approximately 156,400 reactions. In Ecuador, among 646,702 children and young adolescents, 11% at the age of 5 and 48% at the age of 15 reacted. In Tunisia, among 601,502 persons from birth to 24 years tested, 21% at age 5 and 51% at age 15 reacted.

The Medical Research Council of Great Britain reported testing of 94,000 children and young adults. In the rural areas of England and Wales the percentage of tuberculin reactors ranged from 20 at the age of 5, to 56 at the age of 20. In the urban areas of southern England the percentage increased to 9 and 59 for the same ages, and in the other urban areas, mainly northern, it rose from 13% at 5 to 74% at 20.

TEMPORARY CLINIC for vaccination against tuberculosis in a village in India, with signs assuring parents that inoculation was harmless. The continuing campaign to control tuberculosis in India included testing, inoculation and mass radiography in 1952

In Syria, among 175,926 children and young adults, more than 60,000 reacted. In Austria, 21% of 669,848 children and adolescents reacted. Among 671 persons of 25 years of age or younger tested in the Willow Bunch area of Saskatchewan, only 5% reacted.

Incidence and Mortality.—In most parts of the world the number of persons reported to have tuberculosis had undergone only slight change in recent years. K. Torning (Denmark) attributed this in Copenhagen to the intensity of case finding so that a much larger percentage of existing cases were known and were accessible to treatment than was the case 30 years before.

Y. Chasis stated that in Israel 4,000 persons suffered from tuberculosis. A new centre was opened near Jerusalem, including a 225-bed hospital. Israel had 108 beds per 100,000 population and planned to increase the total to 130. H. del Castillo said that among the 20,000,000 people of the Philippines, 300,000 had active tuberculosis. At Istanbul university, Turk., examination of 10,000 students revealed that 21 out of every 1,000 needed treatment, whereas among 94,000 students in 16 universities in France, only 7 out of every 1,000 required treatment.

The 1951 tuberculosis mortality rate was 20.1 per 100,000 in the United States. This was a drop of 9% in a year and was the lowest rate of any major nation in the world. In eight states the rate was less than 10 per 100,000. The lowest was Iowa with 6.3. The highest rate on the mainland was 64.5 in Arizona. In Puerto Rico it was 117 per 100,000.

Treatment.—Denmark had seven beds per annual death from tuberculosis. Norway had approximately six and some states in the United States had nine beds per death. The United States Veterans administration had 15,077 beds in operation for tuberculous patients.

Patients leaving hospitals against medical advice presented a serious problem. E. C. Beacham reported that from the tuberculosis division, Baltimore City hospital, Md., in 1947, 66% of the discharges were irregular, but in 1950 only 12% were irregular. G. J. Drolet said that in 24 institutions caring for the tuberculous in New York city, 25% of the patients left without medical consent.

Drugs were extensively employed in the treatment of tuberculosis. Impressive results were reported from the treatment of tuberculous animals with isonicotinic acid hydrazide. Large numbers of tuberculous people throughout the world were also given this drug, and beneficial effects from the standpoint of control of symptoms were reported. The exact action of the drug was not yet known.

Tuberculosis is so capricious that long periods of observation are necessary before final conclusions can be drawn concerning any form of treatment. One gram of streptomycin every three days, and 12 g. of *p*-aminosalicylic acid daily was regarded as the best drug treatment. In some cases these drugs had been employed for a year or more and it seemed possible that they might ultimately destroy tubercle bacilli.

R. Debre (France) reported on 262 cases of tuberculous meningitis seen between 1947 and 1949, of whom 127 were alive in Feb. 1951. The highest mortality (75%) occurred among those less than 1 year old, and the lowest (37.5%) among those of 6 to 20 years of age. Although none of the cases had been followed long enough to be certain, he believed this disease could be cured by streptomycin.

By 1952 no drug had replaced any of the standard methods of treating tuberculosis. Cortisone and ACTH appeared to have no place in the treatment of tuberculosis, and were thought possibly to be hazardous when administered for coexisting conditions in persons with active tuberculosis.

In some places lung collapse procedures, such as artificial pneumothorax and extrapleural thoracoplasty, gave way to sur-

gical removal of the diseased part. Other workers continued to use collapse methods and surgical resection if later indicated. R. H. Overholt *et al.* (Brookline, Mass.) reported on 426 persons who had undergone pulmonary resection between 1934 and 1950. During the streptomycin era (since 1947) improvement had been so great that the statistics of previous years were only of historic interest. They concluded that pulmonary resection was a useful tool but was only one of many. Frank Dolley *et al.* (Los Angeles, Calif.) reported that of 84 resections between 1947 and 1950, 54 gave satisfactory results, 21 were unsatisfactory and 9 died. B. J. Ryan *et al.* (Sunmount, N.Y.) stated that in 30 consecutive wedge or subsegmental resections the immediate results were excellent, but they emphasized that at least five years of observation were necessary before conclusions could be drawn.

K. Torning (Copenhagen, Den.) said it was too early to determine the true value of pulmonary resections. He emphasized that it was impossible to compare results from resections made under the protection of modern drug treatment with the results of artificial pneumothorax and extrapleural thoracoplasty in the period before drug treatment was introduced. He said that artificial pneumothorax remained the dominating type of collapse treatment, and pointed out that in the past, when properly used even without drug treatment, it resulted in a lasting effect in about 80% of patients.

Prevention.—Infection with the bovine type of tubercle bacillus is as serious as with the human type; therefore preventive measures must include control of the disease in animals. J. Meyer *et al.* presented evidence that in five Swiss cantons the bovine type of tubercle bacillus was responsible for one-third of all the cases of tuberculosis in man. They cited other cantons where the disease had been almost entirely eradicated from cattle and where practically no person was found to have the bovine type of tuberculosis. It was believed that the high incidence of reactors among children in rural areas of England was caused by the bovine type of tubercle bacillus.

Numerous reports were made on the administration of BCG (Bacillus-Calmette-Guérin). The World Health organization demonstrated that a team of one physician and six technicians could cover a population of more than 100,000 persons a year. In India about 300 doctors and vaccinators were engaged in BCG vaccination activities. The International Tuberculosis campaign made its final report on work done from July 1948 through June 1951. The tuberculin test was administered to 36,694,983 persons in 23 countries, of whom 16,650,624 received BCG. The United States Indian bureau announced that in 50 Indian service hospitals all babies were to receive BCG during the first week of life. Moreover, plans were under way to administer BCG among Indian children who had entered school since 1949.

M. I. Levine called attention to numerous deficiencies in the existing knowledge of BCG. E. Groth-Petersen believed that the declining morbidity among children from 7 to 14 years in Denmark was largely the result of wholesale BCG vaccinations in schools. This opinion was countered by reports of greater decreases among children of the same age in places where BCG had not been employed. (See also CHEMOTHERAPY; WORLD HEALTH ORGANIZATION.) (J. A. My.)

Tunisia. A French protectorate in North Africa, Tunisia is situated between Algeria (west) and Tripolitania (east). Area: *c.* 48,332 sq.mi. Pop. (1946 census): 3,230,952, largely (87.6%) Moslem and Arabic speaking but including 239,249 Europeans (143,977 French citizens [many Italian-born] and 84,935 Italians) and 71,543 Jews; (1951 est.)

FRENCH TROOPS inspecting a train wreck in Tunisia early in 1952. The incident followed various acts of sabotage to railroads and other lines of communication in the area, believed by French officials to be the work of Moslem terrorists

3,500,000. Chief towns (1946 census): Tunis (cap., 364,593, incl. 119,222 Europeans); Sfax (54,637); Bizerta (39,327); Sousse (36,566). Ruler, Bey Mohammed el-Amin. Prime ministers in 1952: Mohammed Shenik and (from March 28) Salah ed-Din ben Mohammed Bakkush. French resident general, Jean-Marie-François de Hauteclouque.

History.—The agitation that had begun in Dec. 1951 continued in Jan. 1952. The Shenik ministry made a complaint against France to the United Nations. On Jan. 13 Louis Périllier was succeeded by Jean de Hauteclouque as resident general. The leader of the Neo-Destour party, Habib Bourguiba, was put under surveillance. Rioting broke out, in the course of which several Frenchmen, including the district commander at Sousse, were killed. Countermeasures were taken in February, with particular severity in the Cape Bon region.

In March the bey agreed to dismiss the Shenik ministry, which was succeeded by Salah ed-Din Bakkush's government. Tranquillity was restored in April. The Tunisian complaint was ruled out of order by the U.N. Security council. The French government proposed reforms as follows: Tunisian sovereignty was to be recognized with a gradual advance toward internal self-government; Tunisian assistant-directorships were to be set up beside the French directorships; public offices were to be reserved in principle for Tunisians; the legislative power was to lie with the bey, assisted by two councils (one, legislative, entirely Tunisian, the other, financial, half Tunisian and half French); elections were to be held for municipal councils and caidate assemblies.

This plan met with sharp criticism in the national assembly: the right wing thought it went too far, the left not far enough. The bey refused to approve the reforms and convened 40 notables to examine them. In August he rejected them. Tentative discussions went on while the Arab states and certain Asiatic governments lodged a fresh complaint with the United Nations. The French population of Tunisia objected to the idea of their being excluded from public affairs on the grounds that they paid more than half the taxes and that the country depended on France for financial investments and as a market for its primary

products (oil, wine and phosphates). The Destour party on the other hand was against any idea of joint sovereignty.

The rehabilitation of the wine-growing industry made progress. The budget, however, showed a deficit of more than 7,000,000,000 fr. (See also UNITED NATIONS.)

Education.—Pupils 200,000 (incl. 38,000 French). Lycées and colleges 15. Institute of Higher Studies at Tunis.

Finance and Banking.—Note-circulation 21,000,000,000 fr. Monetary unit: Tunisian franc=metropolitan franc. U.S. \$1=350 fr.

Foreign Trade.—(1951) Imports 59,495,000,000 fr. (including 45,063,000,000 fr. from France); exports 35,212,000,000 fr. (including 15,907,000,000 fr. to France), mainly phosphates (5,745,000,000 fr.), alfalfa grass (5,278,000,000 fr.), olive oil (3,674,000,000 fr.), cereals (2,900,000,000 fr.), iron ore (1,929,000,000 fr.), wine (1,540,000,000 fr.).

Transport and Communications.—(1950) Railways 1,350 mi.; roads 8,694 mi.; motor vehicles 21,500. Ships entered (all ports): 2,928. Aircraft landed: 5,325. (Hu. De.)

Tunnels. Demands for increased electric power, more water for agricultural and human consumption and better transportation routes continued to maintain tunneling activity at a high level throughout the world in 1952.

North America.—The biggest 1952 tunneling news in North America was the initiation in August of the third tube of New York's Lincoln vehicular tunnel under the Hudson river, but two Canadian hydroelectric tunnels and a New York water-supply tunnel continued to rate as the continent's major projects.

One Canadian tunnel project, at Niagara Falls, Ont., was 5 mi. long, consisting of a pair of 45-ft. finished-diameter bores. Work on the second bore began in 1952, the first having been started a year earlier. They would conduct power water that was made available by a 1950 U.S.-Canadian treaty that divided available remaining Niagara river water between the two countries. The other Canadian project was the 10-mi. Kemano tunnel, under way in British Columbia. Having a diameter of 25 ft., it would conduct water to an aluminum company's power plant. Also for hydropower in the continent's northern parts was Ek-lutna tunnel, near Anchorage, Alsk. Five miles long and 9 ft. in diameter, it was one-fourth complete in 1952.

Irrigation continued to be the major objective for tunneling in western United States. The longest tunnels were 5-mi. Tecolote, near Santa Barbara, Calif., and 5.5-mi. Pole hill, part of the Colorado-Big Thompson project in north-central Colorado. The former, which also would provide domestic water, was three-fourths complete. The latter was complete at midyear. Three

other Colorado-Big Thompson tunnels, totalling 5 mi. in length, were completed during the year and another, 1.25 mi. long, was almost complete. These tunnels had diameters of 8 to 10.5 ft. Somewhat larger was the 14-ft. diameter, 1.75-mi. Frenchman hill tunnel in Washington's Columbia basin project, which was three-fourths complete. Duchesne tunnel in Utah, 5.9 mi. long, was completed during the year. Another tunnel completed in western U.S. was a 2-mi. bore for draining and rehabilitating metal mines in the Leadville, Colo., region.

Domestic water supply was the objective of tunneling operations in the Catskill mountains 100 mi. N.W. of New York city. There, driving neared completion in the 25-mi. East Delaware tunnel, and lining was finished in the 6-mi. Neversink tunnel. Each would bring Delaware river watershed water to Rondout reservoir, in the Hudson river watershed, from which it would go to the city via the already completed Delaware aqueduct.

Vehicular tunnels, in addition to the third Lincoln tube, were under construction at three widely separate locations in the U.S. At Norfolk, Va., a 2,100-ft. sunken-tube tunnel under the Elizabeth river was opened to traffic in May, becoming the tenth subaqueous tunnel in the U.S. A similar tunnel at Baytown, Tex., was in place, but work continued on approaches. Twin-tube Broadway tunnel, in San Francisco, Calif., was substantially complete. In Havana, Cuba, a short vehicular tunnel under a navigable channel was built by an unusual method. Half of it was built in an open cofferdam extending from one shore; then the cofferdam was removed to allow rerouting of river traffic over the completed tunnel portion, and another cofferdam was built out from the other shore, to contain construction of the second half. One railroad tunnel, 0.6 mi. long for the Baltimore and Ohio railroad in West Virginia, was opened to traffic.

South America.—Venezuela and Peru had active tunnel projects in 1952. Two tunnels for a new highway between Caracas and its port city of La Guaira were driven as twin two-lane structures. One, 5,900 ft. long, was holed through; the other, 1,560 ft. long, was complete. In Peru, work was 80% complete on 11 tunnels of the Rio Quiros irrigation system. The longest tunnel would be 3.1 mi.; the total length of the tunnels would be 5.4 mi.

Europe.—Extensive tunneling was included in 23 different schemes of the North of Scotland Hydro-Electric board. In all there were to be 47 mi. of main tunnels and 43 mi. of subsidiary tunnels. The longest of these was the 6-mi. Errochty, which was completed in March 1952. The Invergarry and Quoich tunnels, both 2.8 mi. long, were one-fourth and three-fourths completed, respectively, during the year, and the 2.1-mi. Lawers tunnel was one-fourth completed. The principal tunneling works in England were found in improvements to the Manchester corporation waterworks. There, the 5.3-mi. Haslingden and 6-mi. Walmersley tunnels were completed during 1952. The Marl hill tunnel, 2.7 mi., was two-thirds complete.

Viella tunnel, begun in 1926 and the final link in a Spanish Pyrenees highway between Port Bou on the Mediterranean and Fuenterrabia on the Atlantic, was fully excavated and ready for paving and waterproofing work. Its length was 3.1 mi. Another vehicular tunnel, 3,600-ft. Croix Rousse, in Lyons, Fr., was opened in 1952.

The remainder of European tunnels were for hydropower. In Switzerland, of 45 mi. of tunnels in the Maggia valley project, 80% were driven and 45% were completed. This project included extensive rock excavations for underground power plants. In France, driving was two-thirds complete on the 7.25-mi. Isère-Arc tunnel, which also would feed an underground plant. This tunnel would have a 24 ft. high horseshoe section. The largest of a scheme of 15 hydropower tunnels in south-central Norway was the 15-mi. Vinstra tunnel, completed during the

year. Sweden completed the Tasan project, which included 7 mi. of tunnel.

Africa.—At least one hydropower project in Africa involved tunneling. It was the Wadi Agrioun project, in Algeria, for which a 5.2-mi. conduit was completed in 1952. In French Morocco, the 10-mi. Abda Doukkala tunnel was completed and ready to deliver irrigation water diverted from the Oum er Rbia river.

Australasia.—In New Zealand, driving began on the 5.5-mi. Rimutaka tunnel, which would shorten the rail distance between Wellington and Wairarapa. Two rail tunnels were under construction in Australia—both in New South Wales; and three tunnels in the Kiewa hydroelectric project were completed during 1952.

Turkey. A Republic in the southeastern Balkans and Asia Minor, Turkey is bounded west by the Aegean sea, northwest by Greece and Bulgaria, north by the Black sea, northeast by the U.S.S.R., east by Iran and south by Iraq, Syria and the Mediterranean. Area: 296,185 sq.mi. (including 9,256 sq.mi. in Europe). Pop.: (1950 census) 20,934,670, including 1,626,229 in European Turkey. Language (1935): Turkish 86.8%, Kurdish 9.3%, Arabic 0.9%, Greek 0.7%, Armenian 0.4%. Religion (1945): Moslem 98%; Christian 1.4%; Jewish 0.4%. Chief towns (1950 census): Ankara (cap., 286,781); Istanbul (1,018,468); Smyrna (Izmir) (362,340); Adana (117,799); Bursa (100,007); Eskisehir (88,459). President of the republic, Celal Bayar; prime minister in 1952, Adnan Menderes.

History.—Home politics were uneventful during 1952, because of the weakness of the opposition. In foreign relations, the year saw Turkey admitted as a full member of the North Atlantic Treaty organization (NATO), the first result of which was its attendance at the Lisbon conference. This led to the formation of the southeastern Europe command, the headquarters of which was fixed near Smyrna (Izmir). Adm. Robert Carney (U.S.), commander in chief of the southeastern Europe command, and Maj. Gen. David Schlatter, commander of the NATO air forces in southern Europe, attended the Turkish army manoeuvres in September. There was a series of visits of high-ranking U.S. and British officers to Ankara. Gen. Dwight D. Eisenhower went in March; Field Marshal Viscount Montgomery of Alamein went in May and again in September; Gen. Matthew Ridgway included Turkey in his round of visits upon accepting the supreme command of the NATO forces.

With the United States, relations remained particularly intimate because of the help, military, financial and economic, that the U.S. had given Turkey. Relations with Great Britain remained as friendly as ever. King Paul of the Hellenes and Queen Frederika paid an official visit to Ankara in June and received an enthusiastic welcome. On Aug. 5 visas between Turkey and Greece were abolished. Yugoslavia concluded a commercial agreement with Turkey, taking 100,000 tons of wheat in exchange for a variety of products.

With the Soviet Union and Bulgaria the war of nerves continued. Both these countries sent notes protesting that Turkey's association with NATO revealed aggressive intentions and was aimed against the U.S.S.R. and its allies. Meanwhile Bulgaria continued to create incidents on the frontier.

Traditional friendship was maintained with France, and relations with Italy became cordial. Friendship with Germany was restored. A German ambassador arrived, and there was a marked revival of Turco-German trade.

Turkey's attitude was always friendly toward the other Moslem countries, although it declined to take part in the World

Moslem conference held at Karachi in February. Treaties of friendship and commerce were concluded with Pakistan and India.

The government continued its policy of denationalization and encouragement of private enterprise and foreign investment. By 1952 there was foreign capital in seven major undertakings in Turkey. A notable enterprise was the Seyhan barrage, a £T30,000,000 scheme, in which U.S. and private native capital was invested.

Great progress was being made in agriculture, largely because of the vast sums contributed under the European Recovery program. The Bank of Agriculture granted no less than £T914,000,000 in loans to farmers. More than 450,000 ac. of land were earmarked for reclamation, and large areas were distributed to landless peasants.

The harvest was excellent and large quantities of wheat were available for export. The dispatch of chrome to the United States expanded, and that of carpets and wool doubled. The coal and iron and steel industries were expanding rapidly.

Between 1947 and 1952 the national income rose by 54% and was estimated in 1952 at £T11,000,000,000.

(See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; MIDDLE EAST; NORTH ATLANTIC TREATY ORGANIZATION.) (MA. B.)

Education.—Schools (1950-51): primary 17,318, teachers 35,770, pupils 1,675,415; secondary 442, teachers 4,546, pupils 78,449; *lycées* 92, teachers 1,944, pupils 23,573; farming and handicraft 222, teachers 3,085, pupils 31,205; professional 88, teachers 1,257, pupils 21,684. Institutions of higher education (1950-51): 23 (including universities of Istanbul and Ankara with 1,431 teachers and 21,366 students), teaching staff 2,101, students 27,585. Illiteracy (1946): male 56.3%; female 83.2%.

Finance and Banking.—Budget: (1951 actual) revenue £T1,344,000,000, expenditure £T1,579,000,000; (1952-53 est.) revenue £T1,551,000,000, expenditure £T1,750,000,000. Currency circulation (Aug. 1952) £T1,310,000,000. Bank deposits (Dec. 1951) £T1,437,000,000. Gold and foreign exchange (Aug. 1952) U.S. \$180,000,000. Monetary unit: Turkish pound or lira with an exchange rate of £T7.84 to the pound sterling and £T2.80 to the U.S. dollar.

Foreign Trade.—(1951) Imports £T1,125,000,000; exports £T879,400,000. Main sources of imports (1951): Germany 24%; U.K. 17%; U.S. 12%; France 6%. Main destinations of exports: Germany 27%; U.S. 21%; U.K. 8%; Italy 4%. Main imports: machines and vehicles 31%; iron and steel and manufactures 10%; cotton yarn and fabrics 11%; petroleum 8%. Main exports: cotton 25%; tobacco 21%; fruit and nuts 13%; nonferrous metals and manufactures 10%.

Transport and Communications.—Roads (1949): 13,530 mi., including 7,900 mi. all-weather roads. Licensed motor vehicles (Dec. 1950): cars 10,071, commercial vehicles 16,386. Railways (1949): 4,882 mi.; passenger-miles (1950) 1,350,000,000; freight ton-miles (1950) 1,573,000,000; freight carried (1950) 7,332,000 tons. Shipping (merchant vessels of 100 gross tons and over, July 1951): 230; total tonnage 423,971. Air transport (Turkish state airways, 1947): flights 6,712; miles flown 1,188,109; passengers flown 78,844. Telephones (1951): 65,150. Radio receiving sets (1950): 320,853.

Agriculture.—Main crops (metric tons, 1951, except as noted): wheat (1952) 6,400,000; barley (1952) 2,900,000; oats (1952) 380,000; maize (1952) 900,000; rye (1952) 650,000; potatoes 676,000; sugar (raw value) 207,000; tobacco 82,000; cotton (raw) 155,000; raisins 55,000; olives 236,000; olive oil 43,000; linseed 25,000; cottonseed 308,000; sunflower seed (1952) 110,000; sesame seed (1952) 30,000; soybeans 2,000; dry beans 79,000; hemp fibre 10,600; oranges and tangerines 82,000. Wine production (1952) 150,000 hl. Livestock (1951): cattle and buffaloes 11,268,000; sheep 26,121,000; horses 1,173,000; camels 108,000; mules (1950) 109,000; asses (1950) 1,633,000; goats 16,500,000; turkeys (1950) 1,200,000; chickens 19,858,000. Wool (clean basis, 1952) 30,000 metric tons. Meat (metric tons, 1951): 99,000 (including beef and veal, 40,000).

Industry.—Fuel and power (metric tons, 1951): coal 4,728,000; lignite 994,000; crude oil 19,000; electricity 114,000,000 kw.hr. Raw materials (metric tons, 1951): iron ore (metal content) 219,000; pig iron 154,000; steel ingots and castings 135,000; copper (smelter) 17,500; chrome (1950) 400,000; manganese ore (1950) 23,200; antimony ore (metal content, 1950) 454,000; salt 300,000; sulphur (1949) 3,100; boracite (1950) 7,100. Lumber (sawn wood, 1949 est.): softwood 308,000 cu.m.; hardwood 154,000 cu.m. Manufactured goods (metric tons, 1951): cement 400,000; cotton yarn 29,000; wool yarn 6,000; paper 24,000.

Union of Soviet Socialist Republics.

The federation of soviet socialist republics is a state covering parts of eastern Europe and of northern and central Asia. Area: 8,598,678 sq.mi., including 1,969,110 sq.mi. (23%) in Europe. Pop.: (1939 census) 170,467,572; (1950 est.) 201,300,000, including about 138,000,000 (68.6%) in Europe. In 1946 the Russians constituted about 51.3% of the population, Ukrainians 17.4% and Byelorussians 3.5%. None of the other nationalities, all non-Slavonic and most of them non-European, reached 3% of the total, the most important being the Turkish-speaking Uzbeks (2.85%). Religion: Russians, Ukrainians, Byelorussians and Moldavians are Greek Orthodox; Lithuanians are Roman Catholic; Latvians, Estonians and Karelo-Finns mainly Lutheran; Georgians have their own autocephalous Orthodox Church; Armenians are Christian; the indigenous inhabitants of Azerbaijan, the five central Asian republics and many autonomous territories (Tatar, Bashkir, Dagestan, etc.) are Moslem, and their number was estimated in 1939 at 24,000,000; Buryats and Kalmyks are Lamaist Buddhist. Chief towns (pop., 1939 census): Moscow (cap., 4,137,016); Leningrad (3,191,304); Kiev (846,293); Kharkov (833,432); Baku (809,347); Gorki (644,116); Odessa (604,223); Tashkent (585,005); Tiflis (519,175); Rostov-on-Don (510,253); Dnepropetrovsk (500,662). Eight towns had a population of more than 200,000 and 43 had more than 100,000.

Chairman of the presidium of the supreme soviet, Nikolai Mikhailovich Shvernik; chairman of the council of ministers, Joseph Vissarionovich Stalin (q.v.).

History.—Any faint hopes that might have been aroused by the tone of Jacob A. Malik's proposals for an armistice in Korea, in June 1951, that the Soviet Union was prepared to come to friendlier terms with the west, were dispelled in 1952 as it was realized that the "cold war" was to be continued—in

Union of Soviet Socialist Republics

Republic	Capital	Area (sq.mi.)	Population (1940 est.)
Russian S.F.S.R.	Moscow	6,533,584	108,800,000*
Ukraine	Kiiv (Kiev)	222,625	40,525,000†
Byelorussia	Minsk	80,154	9,000,000
Uzbekistan	Tashkent	157,336	6,282,400
Kazakhstan	Alma-Ata	1,063,242	6,146,000
Georgia	Tbilisi (Tiflis)	29,421	3,542,300
Azerbaijan	Baku	33,089	3,209,700
Lithuania	Vilnius (Wilno)	25,174	3,000,000†
Moldavia	Chisinau (Kishinev)	13,050	2,700,000§
Latvia	Riga	24,903	1,950,000
Kirghizia	Frunze	76,023	1,459,300
Tadzhikistan	Stalinabad (Dyushambe)	55,058	1,485,100
Armenia	Erivan	11,506	1,281,600
Turkmenistan	Ashkhabad	187,181	1,252,000
Estonia	Tallinn (Reval)	17,413	1,117,300
Karelo-Finnish S.S.R.	Petrozavodsk	68,919	606,300§
		8,598,678	192,357,000

*According to the 1939 census the population of the Russian S.F.S.R. was 109,278,614. Its reduction was explained by the fact that the Karelian A.S.S.R. (469,145 inhabitants in 1939) formed with the areas ceded by Finland in 1940 a Karelo-Finnish S.S.R.

†Excluding the population of Subcarpathian Ruthenia (725,000), which was incorporated into the Ukrainian S.S.R. in 1945.

‡Excluding the population of the Klaipeda (Memel) territory which was incorporated with the Lithuanian S.S.R. in 1945.

§1941 official Soviet estimate.

||Estonian sources before 1940 gave the area of Estonia as 18,358 sq.mi.

Source: Areas and populations are taken from the *Bolshaya Sovetskaya Entsiklopedia: Soyuz Sovetskikh Sotsialisticheskikh Respublik* (Moscow, 1948). While all the areas are postwar, that is, including territorial aggrandizements in the west and east, population figures are in general those of the 1939 census, except for republics which were either increased by the 1939-45 annexations or formed after 1940. The order, as in the original, is according to the number of population.

FIRST SHIPS passing a lock of the Volga-Don shipping canal linking the Volga and Don rivers. Opened to passenger traffic in 1952, the canal was part of a trans-soviet waterway connecting the Black sea with the landlocked Caspian sea for the first time, and linking both with the White and Baltic seas in the north

some respects intensified—and the “iron curtain” maintained. In Europe a Communist German army was set up and the western occupying forces in Berlin were harassed and hampered; western proposals for peace treaties with Germany and Austria were rejected, as were Swedish protests at the shooting down of Swedish aircraft over the Baltic sea and French protests at interference with French aircraft flying to Berlin; Soviet diplomats in Stockholm and London were found to be implicated in cases of espionage. In spite of Stalin’s answer to a question from U.S. newspaper editors in April that “the peaceful coexistence of capitalism and communism is fully possible, given noninterference in the affairs of other states,” the Soviet Union continued to encourage the antiwestern movements in the middle east and north Africa, to supply arms to the Koreans and the Chinese in North Korea, and to give aid to the Communist terrorists in Malaya. A vehement campaign against the alleged waging of germ warfare by U.N. forces in Korea was carried to the United Nations and—by the Soviet Union’s sympathizers—into the lecture halls and pulpits of the west. At home antiwestern propaganda was maintained.

The Soviet public was encouraged by a slow but appreciable increase in the supply of consumer goods and by price cuts; by the progress of the great hydroelectric and irrigation schemes (of which the opening of the Volga-Don canal was an earnest); and by the announcement of a new five-year plan. The Communist party was reorganized at its 19th congress in Moscow in October.

Foreign Policy.—At the Lenin memorial meeting in Moscow on Jan. 21, in the main speech which had come to be regarded as setting the Soviet Union’s propaganda theme for the year, P. N. Pospelov, director of the Marx-Engels-Lenin institute, elaborated in Stalin’s presence on “the crisis of the entire colonial system of imperialism” and “the awakening of the peoples of Asia as evidence of the triumph of creative Marxism.” No force, he said, could now stop this accelerated development of

history. The speech echoed Stalin’s unexpected and unprecedented New Year message to the Japanese people which referred to “those who had fallen under the misfortune of foreign occupation,” and it was echoed in its turn by a spate of sympathy in Soviet newspaper comment for all antiwestern nationalist movements, from Morocco to Malaya.

It was not surprising, therefore, to find that the Chinese delegation to Moscow in September should have been headed by Chou En-lai, the prime minister, and that the discussions should have lasted for a month. The closeness of the two great Communist powers, the apparent cordiality and the detail into which the discussions must have gone were more significant even than those decisions that were published: the return of the main Manchurian strategic railway to Chinese administration, and the Soviet retention of the naval base at Port Arthur. Solidarity with China and a claim to the moral leadership of the eastern world against the west were more firmly stated by the Soviet Union in the course of 1952 than ever before.

In Europe the Soviet Union continued its evasions of the problems of Germany and Austria. The western powers’ note on Austria in March, proposing a “short treaty” draft, went unanswered for five months in spite of reminders: as expected, it proved unacceptable. The exchange of notes on Germany (*q.v.*) was equally inconclusive.

Meanwhile, G. V. Kozlov, one of the Soviet Union’s leading political theorists, writing in the official review, *Problem of Economics*, elaborated on “the mounting antagonisms between the capitalist countries, above all between the United States and Great Britain.” The view was widely canvassed in London and New York, and in messages from U.S. correspondents in Moscow, that the appointment in June of Andrei A. Gromyko, deputy foreign minister, to succeed the far less eminent Gheorgiy N. Zarubin as Soviet ambassador in London betokened a friendlier approach to Great Britain and a wish to explore every opportunity of detaching its foreign policy from that of the United States.

The whole trend of Soviet propaganda was to modify the violence previously shown toward all western countries indiscrimi-

"THE VOICE AT PANMUNJOM," a 1952 cartoon by Fitzpatrick of the *St. Louis Post-Dispatch*

nately and to represent the United States as alone responsible for the existing tension. Thus the charges of germ warfare in Korea were pinned firmly on to U.S. units, and it was equally typical that in the Security council the Soviet Union should have vetoed the resolution for an inquiry by the International Red Cross into the allegations.

Venezuela broke off diplomatic relations with the Soviet Union on June 13, alleging that the Soviet embassy in Caracas had become "a permanent centre of clandestine propaganda" designed to foment internal disorder. This left Argentina and Uruguay as the only South American states in diplomatic relationship with the Soviet Union.

The Party and the Government.—Stalin, as secretary-general of the central committee of the Communist party of the Soviet Union, signed the announcement in the Soviet press on Aug. 20 that the 19th congress of the party would be held in Moscow on Oct. 5. The selection of G. M. Malenkov as secretary of the central committee to present the central committee's report was widely held in the west to indicate that he had been chosen as Stalin's successor (Stalin was 74 in December) in preference to V. M. Molotov or L. P. Beria.

Although, according to the party rules, party congresses were supposed to be held not less than once every three years, such a congress had not been held since 1939 and, before that, 1934. The chief items in the agenda were the reorganization of the party and the details of the fifth five-year plan, which would be held to cover the years 1951–55 and provided for a 70% increase in industrial production. The main change in the party structure was the abolition of the Politburo, the party's supreme policy-making body, and of the Orgburo, the committee dealing with the internal organization of the party, and their supersession by a presidium, which would absorb their functions.

While it would appear that such changes might be merely a matter of tidying up internal organization, it was noteworthy that the main address on the changes in the party's rules, delivered by Khrushchev, another secretary of the central committee, laid special emphasis on the "shortcomings and unhealthy symp-

toms that appear in the life and work of party organizations." The insistence in the new party rules on the "correct selection of cadres" and on the necessity for a period of probationary membership was significant in the light of Khrushchev's statement that "in many party, state and economic organizations selection is made on the basis of friendly relations, personal attachments and kinship." His charge that "there have been fairly widespread manifestations of political carelessness and slackness, and cases of disclosure of party and State secrets" seemed to foreshadow an intensification of the security police work, both within the party and among the ordinary citizens.

The Economic Position.—As in previous years, a state loan of 30,000,000,000 roubles was launched in May and oversubscribed in a week. The bonds were redeemable at par over a period of 20 years, but lottery prizes on the bonds, drawn each year, were equivalent to a rate of interest of 4%.

The new five-year plan, adopted by the party congress in October, was deemed to have been under way since the expiration of the fourth five-year plan at the end of 1950. It aimed at a 70% increase in total production by 1960, covering such figures as 76% more cast iron, 62% more steel, 64% more rolled metal, 43% more coal and 85% more oil. Hydroelectric capacity was to be trebled and powerhouse capacity doubled; the output of heavy forge and press machinery was to be doubled.

The success of the previous plan, and development during the previous year, notably in the construction of hydroelectric plants, suggested that these targets were not beyond reach. The fourth five-year plan was stated to have been fulfilled ahead of time—in four years and three months—with an increase in production of 75% above the 1940 level. It was notable, however, that the timber industry came in for the usual criticism as "lagging behind the nation's needs" and that not only had the output of building materials to be doubled but it had to be of better quality. Brick and slate production had, in fact, to be rather more than doubled, and the production of polished glass to be increased four times.

Very general increases were called for over the whole of agriculture, 40% to 70% for wheat and other grains, cotton, flax, beet sugar, potatoes and tobacco, and twice as much for hay and four times more for root crops. Closely related to these figures was the intention to produce 215,000 tractors and 25,000 combine harvesters, compared with a prewar farm machinery fleet of only 31,000.

The new plan called for an acceleration of the gradual increase in consumer goods and in amenities generally. More goods in the shops, of better quality, and at prices that would give people an increase of 35% in their purchasing power was the way the draft plan put it. Among the specified targets were 32% more cotton goods, 34% more shoes, 70% more lump sugar, three times as much canned dairy products, 80% more restaurants and 25% more theatres.

The plan ordered "several times more" refrigerators, washing machines, vacuum cleaners and sewing machines—all goods that had been appearing in small quantities in the stores of the big cities, at any rate, during 1952.

Meanwhile, the fifth consecutive annual reduction in retail prices, in April, ranging between 10% and 20% over most commodities, and notably food, resulted by the end of June in an increase of 11% in retail sales by state co-operatives and in the collective farm markets.

The report on the fulfilment of the short-term plan for the second quarter of 1952 showed that the gross production plan was fulfilled by 102% but that the ministries concerned with the building of heavy machinery, transport machinery and farm machinery had fallen short, as had the timber, fish, meat and dairy industries. RUSSIAN LITERATURE.)

(C. Ry.)

Education.—Schools (1951): 220,000 primary, secondary and lower technical, 37,000,000 pupils, 1,600,000 teachers; 31 universities and 849 institutions of higher education, 840,000 students and 407,000 taking correspondence courses. In the Russian S.F.S.R. there were 119,000 primary and secondary schools with a total enrolment of 18,000,000 pupils and a teaching staff of 760,000.

Finance.—Budget estimates (000 roubles):

	1950	1951	1952
Revenue	433,167,416	458,716,644	509,911,608
Expenditure	427,937,525	451,502,680	476,920,588

The external value of the rouble, high and nominal: £1 = 11.20 roubles; U.S. \$1 = 4.00 roubles.

Foreign Trade.—(Million U.S. dollars, f.o.b.; percentage of the world trade in brackets):

	1938	1949	1950
Imports	338 (1.5)	943 (1.5)	1,049 (1.8)
Exports	365 (1.6)	1,024 (1.8)	1,141 (1.9)

Main sources of imports (1938; 1950 in parentheses): European people's democracies (Bulgaria, Czechoslovakia, Hungary, Poland and Rumania) 4.1% (60.6%); Germany, Democratic and Federal 14.2% (14.5%); United Kingdom 16.3% (3%); United States 21.9% (0.09%). Main destinations of exports (1938; 1950 in parentheses): European people's democracies 7% (71.3%); Germany 14.7% (8.3%); United Kingdom 33.1% (7.5%); United States 7.5% (3.5%).

Transport and Communications.—Railways (1950 est.): 112,530 km.; the railways accounted for 83% of all goods traffic. Shipping (1950): 437 ships totalling 1,824,000 deadweight tons.

Agriculture.—Main crops (million metric tons):

	1913	1938	1940	1950	1952	1955 Plan
Grain	80.1	90.0	119.0	124.7	131.0	186.7
Sugar beets	10.9	16.7	21.8	24.3		40.0
Potatoes	23.3	65.6	84.2	...		147.8
Cotton	0.7	2.7	2.7	3.8		6.3

Livestock (million head, including those on collective farms, state farms and privately owned):

	1913	1938	1940	1950	1951	1955 Plan
Cattle	60.6	63.2	71.0	57.2	58.8	68.6
Pigs	20.9	30.6	36.1	24.1	26.7	36.2
Sheep and goats	121.2	102.5	108.5	99.0	107.5	160.4
Horses	35.8	17.5	20.6	13.7	14.5	16.4

Industry.—Heavy industry production (million metric tons, electricity in 000,000,000 kw.hr.):

	1913	1937	1940	1950	1951	1955 (Plan)
Coal and lignite	29.1	127.0	166.0	260.0	288.0	371.8
Crude petroleum	9.2	28.5	31.0	37.8	42.1	69.9
Electric power	1.9	36.4	48.2	90.3	104.0	162.5
Pig iron	4.2	14.5	14.9	19.4	21.9	34.1
Crude steel	4.2	17.7	18.3	27.3	31.6	44.2
Copper (000 tons)	97.5	161.0	255.0	...	455.0

(K. Sm.)

The Beacon Press, Unitarian publishing house, added 62 book titles in 1952. About 300,000 Unitarian pamphlets were distributed and the new newssheet *The Signal* achieved a circulation of 65,000.

The Unitarian Service committee, in co-operation with the U.S. state department, undertook a program to rebuild the educational system of Korea, and a team of educational leaders was dispatched there. By 1952 technical projects of the Unitarian Service committee had been carried on in 13 countries and 56 universities, involving 160 professional volunteers.

The Triennial Congress of the International Association for Liberal Christianity and Religious Freedom, founded in 1900 by the American Unitarian association, was held in Oxford, Eng., in Aug. 1952. Forty U.S. delegates attended, and 14 countries were represented. The problem of authority and freedom was discussed in the fields of theology, comparative religions, science, society and education. For the first time, a layman, Percival Brundage of New York, was elected president. (See also CHURCH MEMBERSHIP.)

(J. H. L.)

United Church of Canada. The United Church of Canada, which in 1925 united the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches in Canada, reported for 1951 a membership of 834,118 with 2,002,553 persons under pastoral oversight, a Sunday school enrolment of 550,922 and 6,405 preaching places. The church owned property worth \$170,542,932. The missionary and maintenance givings of the church in 1951 totalled \$3,191,294, an advance over the previous year of \$181,315.

Among the important events in the life of the United Church during 1952 were: the setting of a new objective of 1,000 new recruits for the ministry of the church at home and the overseas work abroad, or 200 each year for the five years beginning in 1952; the continuance of negotiations on reunion with representatives of the Church of England in Canada, with slow progress; the raising of the minimum salary scale for married ministers to \$2,700 with an additional amount of not less than \$400 for travel grant and free use of furnished parsonage; the raising of \$770,000 for church extension in new housing, industrial and mining areas across Canada, with at least \$2,500,000 as the goal to be reached over the next five years.

The Rt. Rev. A. A. Scott, principal of Indore college, India, was elected moderator in September to hold office until 1954.

Unitarian Church. Unitarian membership in the United States continued its growth during 1952. Forty new fellowships (churches with less than 50 members) were established in various communities, making a total of 95 fellowships. The Church of the Larger Fellowship for isolated Unitarians numbered 1,103 members. The Unitarian Laymen's league adopted a five-year plan to increase the number of members in existing churches. The first Unitarian society in South America was organized in Guayaquil, Ecuador.

At the annual meetings of Unitarian organizations in Boston, Mass., in May, the annual award for distinguished service was given to G. Brock Chisholm, director general of the World Health organization. Resolutions were passed against the McCarran-Walter Immigration act; against universal military training; and against the appointment of an ambassador to the Vatican. Other resolutions were in favour of peaceful relations between east and west, the United Nations Genocide convention and the elimination of racial discrimination in churches and church conferences.

United Nations. During 1952, relations between the Soviet bloc and the "free world" continued hostile and nonco-operative. As a result the United Nations was able to achieve little in dealing with problems that required agreement between them. The United Nations nevertheless was able to make some progress in those areas of primary or exclusive concern to the "free world" and particularly in promoting the economic, social and political development of countries outside the sphere of Communist control.

Membership and Representation.—There was no change in the membership of the United Nations during 1952. The following states were members: Afghanistan, Argentina, Australia, Belgium, Bolivia, Brazil, Burma, the Belorussian Soviet Socialist Republic, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, the Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, Iceland, India, Indonesia, Iran, Iraq, Israel, Lebanon,

Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Pakistan, Panamá, Paraguay, Peru, the Republic of the Philippines, Poland, Saudi Arabia, Sweden, Syria, Thailand, Turkey, the Ukrainian Soviet Socialist Republic, the Union of South Africa, the Union of Soviet Socialist Republics, the United Kingdom, the United States of America, Uruguay, Venezuela, Yemen and Yugoslavia.

The question of the admission of new members into the United Nations continued to be a leading subject of controversy. The inability of the permanent members of the Security council to reach an agreement on this question resulted in the continued failure of the organization to admit new members.

Nevertheless, at the sixth session of the general assembly a spirited attempt was made on the part of a group of South American members to break the deadlock. On their initiative a resolution was passed designed to facilitate action by the Security council by interpreting the criteria for membership more precisely and less subjectively. In addition the permanent members of the Security council were asked to make an effort to come to an agreement on the matter.

However, when in February the Security council resumed consideration of the admission of Italy to the United Nations, especially in view of Italy's designation as administering authority for Somaliland, this step was blocked by a Soviet veto. Conversely, in September the Soviet Union's proposal, that all 14 applicants previously examined by the council should be admitted en bloc, was voted down. Finally, in the same month, the applications of Libya, Japan, Vietnam, Cambodia and Laos were vetoed by the U.S.S.R. and the application of the Democratic Republic of Vietnam was turned down by a majority vote. Libya's application was rejected notwithstanding the fact that Libya became an independent state under United Nations auspices.

On Oct. 25 the general assembly rejected, for the third successive year, the claim of the Central People's (Communist) Government of China to represent the Chinese state in the U.N. and approved the credentials of the Nationalist delegation for the duration of the assembly's seventh session.

Organization and Meetings.—The sixth session of the general assembly convened at the Palais de Chaillot in Paris, Fr., on Nov. 6, 1951, under the presidency of Luis Padilla Nervo of Mexico, and was concluded on Feb. 5, 1952.

The seventh session of the general assembly convened in the new hall at permanent headquarters in New York city on Oct. 14, 1952. Lester B. Pearson of Canada was elected president.

Following the customary general debate, the assembly adopted an agenda of 73 items and allocated them to its 6 main committees and the *ad hoc* Political committee for consideration. Among the more important substantive items included on the agenda were the following: the Korean question, the Tunisian and Moroccan questions, the report of the Disarmament commission, the report of the Collective Measures committee, admission of new members, treatment of people of Indian origin in the Union of South Africa, racial segregation practices of the government of the Union of South Africa, the Austrian question, the Palestine situation, the reports of the Security, Economic and Social, and Trusteeship councils, economic development of and technical assistance to underdeveloped countries, the draft Convention on Freedom of Information, the draft Convention on Political Rights of Women, the refugee problem in its various aspects, problems of nonself-governing territories and trusteeship, co-ordination of specialized agencies, the secretary-general's proposals for the reorganization of the secretariat and the 1953 budget.

The Security council continued to suffer during 1952 from the loss of prestige and effectiveness resulting from the continuing

deadlock among its permanent members. The principal questions before the council during the period under review were the India-Pakistan question, aspects of the Korean "police action," and disarmament, in addition to membership applications. The membership of the council during the year included the five permanent members—China (represented by the Nationalist government), France, the U.S.S.R., the U.S., and the U.K.—and six nonpermanent members—Brazil, Chile, Greece, the Netherlands, Pakistan and Turkey. During its seventh session, the general assembly elected Colombia, Denmark and Lebanon to replace Brazil, the Netherlands and Turkey for two-year terms ending Dec. 31, 1954.

The Economic and Social council decided to hold only one regular session during 1952, thus departing from its previous practice of two regular sessions a year. In addition the council held a special one-day session on March 24, as requested by the sixth session of the general assembly, for the purpose of transmitting the assembly's instructions regarding the two draft covenants on human rights to the Commission on Human Rights. During 1952 the council's membership was as follows: with terms ending Dec. 31, 1952—Canada, Czechoslovakia, Mexico, Iran, Pakistan and the U.S.; with terms ending Dec. 31, 1953—the Philippines, Poland, Sweden, the U.S.S.R., the U.K. and Uruguay; and with terms ending Dec. 31, 1954—Argentina, Belgium, China, Cuba, Egypt and France. During its seventh session the general assembly elected the following states to membership on the council for a three-year term ending Dec. 31, 1955—Australia, India, Turkey, the U.S., Venezuela and Yugoslavia.

The Trusteeship council held two sessions during the year, the 10th from Feb. 27 to April 1 and the 11th from June 3 to July 24, both sessions meeting at U.N. headquarters. Alan Burns of the U.K. served as president during the 10th while Awni Khalidi of Iraq presided over the 11th. The membership of the council during 1952 was as follows: members administering trust territories—Australia, Belgium, France, New Zealand, the U.K. and the U.S.; members by virtue of their permanent seats on the Security council—China and the U.S.S.R.; and members elected by the general assembly—the Dominican Republic, El Salvador, Iraq and Thailand. At the seventh session of the general assembly El Salvador was re-elected and Syria was elected to replace Iraq for a three-year term.

Administration and Finance.—On Nov. 10, 1952, Secretary-General Trygve Lie announced his resignation to take effect as soon as a successor was chosen. When Lie's first term expired in 1950, the Security council was unable to recommend another person for the position, as the charter requires, because of the inability of the permanent members of the Security council to agree. Lie's term was renewed for a three-year period which was due to expire early in 1954.

Suggestions for a basic reorganization of the secretariat were presented to the seventh session of the general assembly by the secretary-general. The proposals had as their underlying objectives greater co-ordination of activities in related fields as well as relieving the secretary-general of many administrative functions that he might devote greater attention to policy formulation. With this in mind, the secretary-general proposed that the departments of the secretariat be reorganized into three major groupings, each headed by a deputy secretary-general, as follows: (1) Political and public affairs (to include departments of Security council affairs, trusteeship and information from nonself-governing territories, and public information); (2) economic and social affairs (to include departments of economic affairs, social affairs and the Technical Assistance administration); and (3) administrative and conference services (to include departments of administrative and

VIEWS of the General Assembly building at U.N. headquarters in New York city, completed before the opening of the seventh general assembly session on Oct. 14, 1952

Right: CLOSE-UP of the panel behind the auditorium rostrum. The circular shields surrounding the U.N. emblem were to carry the coats of arms of U.N. member nations

Below, left: MANHATTAN SKYLINE with the buildings of the U.N. headquarters in the foreground. They are, left to right: the Secretariat building, the Conference building and the General Assembly building

Below, right: THE MAIN LOBBY, and balconies leading to the public galleries of the assembly hall. The walls of the lobby, at right, were of glass panels set between marble piers

financial services, and conference and general services and the library). The legal department would be attached to the secretary-general's office. The three deputy secretary-generals would, with the secretary-general himself, constitute a small policy-formulating team. Each deputy secretary-general would be responsible for over-all co-ordination of programs within his field while maximum responsibility for day-to-day administration would be delegated to the principal directors of divisions.

The secretary-general's budget estimates for 1953 provided for a total expenditure of \$47,765,200 or a decrease of \$331,850 from 1952 estimates. U.N. income was estimated at \$6,112,500 leaving \$41,652,700 to be raised by contributions of members. The Advisory Committee on Administrative and Budgetary Questions recommended a reduction of \$990,900 in the secretary-general's estimate.

The Committee on Contributions recommended the further revision of the scale of assessments. It recommended that the U.S. contribution to the U.N. be reduced from 38.92% to 35.12%. However this reduction did not meet the demand of the U.S. congress which had, in July, stipulated that henceforth the U.S. contribution to any international organization was not to exceed 33.33%.

Political Problems.—Korea.—During 1952 fighting in Korea continued on a limited and sporadic basis along a line in the general region but for the most part north of the 38th parallel. Truce negotiations at Panmunjom became completely deadlocked on the prisoner-of-war issue with no immediate prospect of agreement. The United Nations Commission for the Unification and Rehabilitation of Korea was primarily concerned with observing and reporting on political developments in the Republic of Korea. The relief and reconstruction of Korea continued for the greater part of the period to be the exclusive responsibility of the United Nations command with the United Nations Korean Reconstruction agency (U.N.K.R.A.) acting in an advisory and consultative capacity under an arrangement originally entered into under which U.N.K.R.A. was to assume responsibility within six months after the cessation of hostilities. The prolonged deadlock in armistice negotiations and the consequent continuation of hostilities led to a revision of this arrangement by which U.N.K.R.A. took over a portion of the responsibility for reconstruction. On Oct. 2, J. Donald Kingsley, agent-general for U.N.K.R.A., announced that the agency was prepared to begin large-scale operations in Korea by spending up to \$70,000,000 on relief and reconstruction during the year ending June 30, 1953. (For an account of the progress of the war and of the truce negotiations in Korea during 1952, see *KOREAN WAR*.)

When the general assembly met on Oct. 14, the Korean question was included on its agenda and referred to the Political committee. In the course of committee discussion, Secretary of State Dean Acheson, for the Unified Command, and Andrei Y. Vishinsky, for the Communists, gave long and detailed statements of the two opposing positions with no indication of an area for compromise. Acheson introduced a draft resolution, supported by the United States and 20 other members, calling for approval of the principle of voluntary repatriation of prisoners and the communication of the general assembly's position by its president to the authorities of Communist China and North Korea, while Vishinsky introduced a draft resolution which, without mentioning the prisoner issue, provided for the establishment of a commission, composed in part of "neutrals," to achieve a cease-fire and a political settlement in accordance with the wishes of the Koreans. Several delegations, including the Asian-Arab, concentrated their efforts on finding a formula acceptable to both sides.

Palestine.—The general assembly in January adopted a reso-

lution by which the U.N. Conciliation Commission for Palestine was directed to continue its efforts. These efforts eventually resulted, in September, in the Israeli government's agreeing to release blocked bank accounts belonging to Palestinian Arab refugees. While this step was regarded as a hopeful beginning, the major issues of the Palestinian problem, namely, war damages, the repatriation of refugees, the status of Jerusalem and the terms of a peace treaty, remained unresolved when the seventh session of the general assembly met in October.

With respect to the special problems created by the existence of more than 800,000 Arab refugees in the near east, the director and advisory commission of the United Nations Relief and Works Agency for Palestine Refugees in the Near East placed before the sixth session of the general assembly a three-year relief and reintegration program. To be concluded by July 1, 1954, the program contemplated the expenditure of \$50,000,000 for relief and \$200,000,000 for reintegration, these funds to be raised by voluntary contributions of member states.

In January the general assembly adopted the director's program virtually intact.

Kashmir.—Although the United Nations representative for India and Pakistan was able to report substantial progress to the Security council in reconciling the differences which prevented a settlement of the Kashmir question, the two nations continued to hold opposing positions on fundamental issues.

Essentially the U.N. representative's task was to carry out resolutions adopted in 1948 and 1949 by the former United Nations Commission for India and Pakistan providing for the creation of suitable conditions for the holding of a plebiscite in Kashmir under United Nations supervision. During the period under review, the U.N. representative's attention was primarily directed toward finding an agreement on the conditions for the demilitarization of the area, the character and quantity of the forces to be left by the two nations in the area, the period of demilitarization and the time at which the plebiscite administrator would assume his functions. The U.N. representative submitted reports to the Security council in January, April and September on the progress of negotiations but was unable to resolve differences on the key question of the number and character of forces to be maintained by the two countries in the area during the period of the proposed plebiscite. (See also *INDIA*.)

Unification of Germany.—The United Nations Commission to Investigate Conditions for Free Elections in Germany, a body created by the general assembly at its sixth session, was unable to fulfill its task because of the nonco-operation of the authorities of the Soviet Union and the (East) German Democratic Republic. The commission, meeting largely in Geneva, submitted reports in April and July on its efforts to carry out its instructions. Although it received every assurance of co-operation from the Allied high commission in Western Germany and the authorities of the (West) Federal Republic of Germany and the western sectors of Berlin, the Soviet and East German authorities did not reply to the commission's communications. As a result, the commission adjourned sine die in July.

Anglo-Iranian Oil Question.—The International Court of Justice commenced public hearings on this question in June. It decided in July that it lacked jurisdiction to rule on the dispute. By a vote of nine to five it ruled that the 1933 concession was a contract not having the character of a treaty and that only treaties subsequent to the 1932 declaration could give the court jurisdiction. The court also declared that its interim order of protection of 1951 had lapsed. (See also *INTERNATIONAL LAW*; *IRAN*.)

Tunisia and Morocco.—Having failed in Nov. and Dec. 1951,

in their efforts to place the Moroccan question on the agenda of the sixth session of the general assembly, the Arab-Asian bloc turned, in March 1952, to the Security council in an effort to bring the Tunisian problem before that organ. As in the case of Morocco, affairs in Tunis had reached a crisis stage in which widespread anti-French, nationalistic disturbances were being met by vigorous police action on the part of the French authorities. Again, as in the Moroccan case, negotiations on administrative and political reforms were ostensibly being conducted in Tunis by French and Tunisian representatives.

The Security council discussed the question in April and though the subject at hand was the procedural one of whether the council should put the question on its agenda, heated debate ranged over the substance of the dispute. The French delegate insisted that the situation was an internal one and maintained that the negotiations then in progress would be hampered by council consideration. The Pakistan representative doubted the integrity of the negotiations and pointed to the council's unbroken record of admitting every item for discussion. On April 14 the council, by a vote of three to five with four abstentions, decided not to include the question on its agenda.

The Arab-Asian bloc then requested the secretary-general to call a special session of the general assembly to consider the matter. However, in July the secretary-general announced that the request had failed to receive the necessary majority of member states.

In September the Arab-Asian bloc again submitted the Tunisia-Moroccan questions for inclusion on the agenda of the seventh general assembly, and the assembly's General committee recommended favourable action. The general assembly followed the recommendation.

Regulation of Armaments.—The sixth session of the general assembly in January established a 12-power Disarmament commission to replace the Atomic Energy and Conventional Armaments commissions. Operating as a subsidiary organ of the Security council, the new body was given the task of drawing up a draft treaty or treaties for the regulation and reduction of armaments and the international control and prohibition of atomic energy and weapons as well as other weapons of mass destruction. Although the Soviet bloc disagreed with the resolution establishing the Disarmament commission, the U.S.S.R. nevertheless consented to participate in its work.

The commission considered work programs submitted by the U.S., Soviet and French delegates. Over Soviet opposition the commission adopted, in March, the French program which included (1) the problem of disclosure and verification of all armed forces and armaments, including atomic; (2) regulation and control of armed forces and armaments, especially atomic weapons and weapons of mass destruction; and (3) the procedure and timetable necessary to effect these objectives. The commission also decided to create two subordinate committees to consider the first and second of the above items.

It soon became evident, however, that the new commission was facing the same problems that its predecessors had failed to solve. In the matter of disclosure of information on armed forces and weapons, the western concept of progressive disclosure ran counter to Soviet insistence upon full and simultaneous disclosure of both atomic and nonatomic weapons. With respect to reduction of armaments, the Soviet government advocated a flat one-third cut while the western powers maintained that a "balanced" reduction was required. Finally and most important, both sides were almost as far apart as ever on the questions of prohibition and control, especially with regard to atomic weapons. The Soviet Union adhered to the view that prohibition must precede control, and defined control as inspection and verification by an international authority in a manner

which did not interfere in the domestic affairs of states. The western powers insisted, on the other hand, that prohibition was only realistic after an effective system of controls had been installed and that such a system to be effective must include ownership and management by an international authority of atomic installations as well as an unhampered right of inspection.

In May the three western powers defined what they meant by balanced reduction of armed forces by submitting a proposal that the armed forces of China, the Soviet Union and the United States be limited to between 1,000,000 and 1,500,000, that France and Great Britain limit theirs to between 700,000 and 800,000 and that other powers limit theirs to not more than 1% of their population. The western powers felt that if the Soviet Union could accept this or a related basis for the reduction of armed forces, discussion could then proceed to the question of the reduction, control and prohibition of armaments. The Soviet delegate, however, turned down both the proposal and the method since the proposal did not distinguish between land, sea and air forces, while the method reversed the order held necessary by the Soviet Union.

In August the three western powers submitted a new proposal designed to meet Soviet criticism of their plan for a balanced reduction of armed forces. The proposal called for a big five conference to consider the distribution by principal categories of the armed forces considered necessary, the types and quantities of armaments necessary to support these forces, and the elimination of all armed forces and armaments, including atomic weapons and weapons of mass destruction, not expressly permitted. It was further proposed that regional conferences be subsequently held to reach similar agreements covering other states and that the results of these conferences be embodied in a draft treaty. However the Soviet delegate rejected this proposal because of the time lag between the limitation on armed forces and the prohibition of atomic weapons.

Bacteriological Warfare.—In addition to the wide divergence of viewpoints mentioned above, the progress of the Disarmament commission was further hampered by protracted and heated discussion caused by the Soviet accusation that the United States was employing bacteriological weapons in Korea. This charge was first raised at the commission's second meeting in March and in subsequent meetings was categorically denied by the U.S. supported by all the other delegations. The U.S. delegate proposed an investigation of the Soviet charges by the International Red Cross but this was rejected by the Soviet delegate. When the Soviet delegate returned to these charges in late March he was ruled out of order on the ground that the commission was not the proper body for making or discussing specific charges of that nature.

The Soviet Union then turned to the Security council where it raised much the same question in somewhat different form. In June the Soviet delegate proposed that the council appeal to all states which had not adhered to the Geneva protocol of 1925 on the prohibition of the use of chemical and bacterial weapons to do so at once. The U.S. was the principal nation which had not ratified the treaty. The U.S. delegate maintained that the treaty was an obsolete paper promise and ineffective as a deterrent to the use of those weapons and that the sincerity of the United States on this question was being demonstrated in the Disarmament commission where the U.S. delegate was supporting efforts to establish an effective system of international control over all weapons of mass destruction. This view was generally supported by other members of the council and the Soviet proposal was rejected in late June by a vote of one to none with ten abstentions. On the other hand, two U.S. proposals, one requesting the International Red Cross to investigate the charges, and a second condemning the fab-

rication of false charges, were vetoed by the Soviet delegate.

The Soviet Union then returned to the Disarmament commission and, in connection with the three-power proposal of August mentioned above, itself proposed that priority in consideration be given to the violation of the prohibition of bacterial warfare. The commission rejected the Soviet proposal in late August and adopted a proposal sponsored by Chile, France and Turkey which provided for specific reference to bacteriological weapons in the commission's working program.

Economic and Social Co-operation.—United Nations activities in this field were of a wide and varied nature. The character of the activities ranged from research and publication to field operations. The subject matter covered the whole range of topics suggested by the above title—economic stability and development, technical assistance, control of narcotics and other social evils, definition and protection of human rights, status of women, etc. In some instances the work was done directly by organs of the United Nations; in other instances in co-operation with one or more of the specialized agencies, as in the case of technical assistance.

Co-ordination of Activities.—One of the continuing problems with which the principal organs of the United Nations dealt during the year 1952 was that of the better co-ordination of the policies and activities of the United Nations and the specialized agencies in order to prevent overlapping and achieve concentration on tasks of primary importance. During its sixth session in February, the general assembly approved the system of priorities which had been adopted by the Economic and Social council as a co-ordinating device. During its 14th session the Economic and Social council approved a revised list of

major programs which were to enjoy priority, along with a number of contributory programs. The major programs were as follows: (1) increased food production and distribution; (2) increased production in fields other than food; (3) measures for promoting domestic full employment and economic stability within an expanding economy; (4) acceleration of welfare, social security and basic public health programs; (5) development of education and science; and (6) formulation and wider observance of human rights.

Economic and Social Surveys.—The secretariat published two important surveys which were the basis of much of the discussion of U.N. organs and which were of great value to governments and scholars. One was the *World Economic Report, 1950-51* which contained an analytical account of economic developments in the years 1950 and 1951. The other was the first survey of the world social situation ever to be prepared which attempted to present a balanced picture of living conditions throughout the world.

Technical Assistance.—An ever-increasing share of the time and efforts of the United Nations and the specialized agencies was devoted to technical assistance. A part of this work was financed from the regular U.N. budget and was administered by the Technical Assistance administration of the United Nations. An increasing portion of this work was being done under the expanded program of technical assistance, under a special account established in 1950, and under the direction of the Technical Assistance board and the Technical Assistance committee of the Economic and Social council. The council, during its 14th session, voted to raise the target for contributions to finance the expanded program from \$20,000,000 for 1952 to \$25,000,000 for 1953.

In order to reduce the need for foreign experts, increasing attention was given to the training of local personnel. During the first half of 1952, 769 fellowships were awarded for study abroad. Special emphasis was also placed upon training centres, demonstration projects and pilot plants in recognition of the desirability of training individuals locally.

Economic Development.—In the field of economic assistance to underdeveloped nations, the problem of meeting the needs and demands of underdeveloped countries for foreign capital to help finance their economic development continued to absorb much of the interest and activities of the Economic and Social council and other bodies. Inequalities in standards of living, in available capital and in production throughout the world remained as serious as ever. These problems were further aggravated by economic dislocations resulting from the rearmament programs of the western powers as well as the growing disinclination of the U.S.—the chief capital exporting nation—to make capital grants for other than strategic purposes.

The search for a solution developed largely along three lines. The first consisted of efforts to facilitate the flow of private capital to underdeveloped areas. Of chief interest in this connection was the proposal to create an International Finance corporation to make equity investments or loans to private enterprises in underdeveloped countries. It was believed that the example set by the corporation would help to dissipate the lack of confidence which was felt to be the chief deterrent to the resumption of large-scale private international investment. This proposal was considered by a group of experts appointed by the secretary-general, by the Economic Employment and Development commission and by the Economic and Social council which referred the problem to the International Bank for Reconstruction and Development. The bank reported favourably on the proposal to the Economic and Social council at its 14th session but that organ could not come to an agreement on what action should be taken and referred the matter

"THE LONG AND SHORT OF IT," a 1952 cartoon by Russell of the *Los Angeles Times*

back to the bank for further study. At the same session the council asked its Fiscal commission to study the question of tax incentives as a means of stimulating private foreign investment.

The second approach was embodied in a resolution adopted by the sixth session of the general assembly requesting the Economic and Social council to submit a detailed plan for establishing a special fund for grants-in-aid and low-interest, long-term loans to underdeveloped nations. The assembly resolution was partly the result of recommendations made in 1951 by a group of experts appointed by the secretary-general. It barely passed the assembly by a vote of 30 to 16 with 11 abstentions, most of the industrialized countries voting in the negative. The Economic and Social council considered the assembly's proposal at its 14th session and finally decided to refer the matter to a special committee of nine experts who were to submit detailed recommendations to the council's 15th session in March 1953.

Finally, efforts were undertaken in the Economic and Social council to liberalize the lending operations of the International Bank for Reconstruction and Development. Debate on this question at the council's 14th session was generally appreciative of the increased flexibility in the bank's operations, but criticism was expressed on the size of the interest rates charged by the bank.

Human Rights.—The general assembly in its sixth session instructed the Commission on Human Rights to submit two covenants, one embodying political and civil rights, and the other economic, social and cultural rights. It also requested the commission to prepare a recommendation concerning international respect for the self-determination of peoples. This task occupied much of the spring session of the commission. Its recommendation was strongly resisted by the western colonial powers. As the commission was unable to complete the drafting of the two covenants, it requested, and received permission from the Economic and Social council to finish its work in 1953.

The Commission on the Status of Women completed in March 1952 a draft convention on the Political Rights of Women which was approved for transmission to the general assembly.

Refugees.—The work of the high commissioner for refugees in meeting the needs of refugees left without assistance by the termination of the International Refugee organization (I.R.O.) was greatly handicapped during 1952 by lack of funds. Only about half of the \$3,000,000 requested by the high commissioner was thought likely to be available by the end of the year. (See also REFUGEES.)

Specialized Agencies.—An important part of the work in the field of international economic and social co-operation was performed by the specialized agencies, international organizations set up on the basis of their own constitutions for specialized purposes and brought into relation with the U.N. by agreements concluded by the appropriate organs of the U.N. and the particular specialized agency in question. During 1952 the following specialized agencies were in actual operation:

International Labour Organization (I.L.O.).—Headquarters in Geneva, Switz.; David A. Morse, director-general; 65 members. (See separate article.)

Food and Agricultural Organization (F.A.O.).—Headquarters in Rome, It.; Norris E. Dodd, director-general; 67 members. (See AGRICULTURE.)

International Monetary Fund.—Headquarters in Washington, D.C.; Ivar Rooth, managing director; 51 members. (See separate article.)

International Bank for Reconstruction and Development.—Headquarters in Washington, D.C.; Eugene R. Black, president; 51 members. (See separate article.)

International Civil Aviation Organization (I.C.A.O.).—Headquarters in Montreal, Que.; Edward Warner, president of the council; 57 members.

United Nations Educational, Scientific and Cultural Organization (U.N. E.S.C.O.).—Headquarters in Paris, Fr.; Jaime Torres Bodet, director-general; 65 members.

World Health Organization (W.H.O.).—Headquarters in Geneva, Switz.; Brock Chisholm, director-general; 78 members plus one associate member (Southern Rhodesia). (See separate article.)

International Telecommunications Union (I.T.U.).—Headquarters in Geneva, Switz.; Leon Mulatier, secretary-general; 89 members (including

colonial areas).

Universal Postal Union (U.P.U.).—Headquarters in Berne, Switz.; Fritz Hess, director of the international bureau; 92 members (including colonial areas).

World Meteorological Organization (W.M.O.).—Headquarters in Geneva, Switz.; G. Swoboda, chief of the secretariat; 77 members.

The constitutions of two additional specialized agencies had not yet entered into force because of the absence of the necessary ratifications. The convention establishing the Inter-Governmental Maritime Consultative organization (I.M.C.O.) had been ratified by 10 states. Ratification by 21 states, including the principal maritime powers, was required. The constitution of the International Trade organization (I.T.O.) had not been ratified by any signatory. The 52-member Interim commission continued to function, however.

Aid to Nonself-Governing Peoples.—The Committee on Information from Nonself-Governing Territories (formerly the Special Committee on Information Transmitted under Article 73 [e] of the Charter) devoted much of its 1952 session to examining and making recommendations on information submitted by the administering powers on social developments in the nonself-governing territories. Social problems and dislocations resulting from the impact of western knowledge, science and techniques upon village and tribal societies were examined. The committee also dealt with the question posed by the obligation of member nations having nonself-governing territories to supply information to the U.N. on economic, social and educational matters in these territories until they achieve "a full measure of self-government." This problem had been accentuated by the steady decline in the number of territories reporting, the administering power in each case claiming that self-government had been achieved. In January the sixth session of the general assembly submitted a list of factors to serve as guides to the administering powers in determining this question. In addition it created an *ad hoc* committee to study the question and report to the seventh session of the general assembly.

In accordance with an assembly request, the council at its tenth session established a standing committee on petitions to handle petitions dealing with specific complaints. In response to another assembly request, the council reviewed the methods and functioning of its visiting missions. In compliance with a third assembly resolution, the council's standing committee on administrative unions reviewed the problems posed by the need to balance the administrative convenience of the administering powers with the obligations of those powers to the trust territories incurred under the charter and trust agreements. Finally, the council deferred consideration of an assembly recommendation on indigenous participation in the council's work until its 11th session at which time it passed a resolution expressing the hope that the administering authorities would include in their delegations to the council inhabitants of their trust territories.

The 11th session of the Trusteeship council was devoted in large part to a detailed review of conditions and progress in seven African trust territories. Reports by the administering powers on Somaliland, Ruanda-Urundi, Tanganyika, the two Togolands and the two Cameroons were considered, and observations and recommendations were made to the general assembly. In addition, arrangements were completed for a visiting mission to the four West African trust territories. This mission, in addition to its regular duties, was instructed to make a special study of the Ewe unification problem, as requested by the general assembly. The Ewe problem, which had increased in importance, was the result of the desires of the Ewe people (about 800,000) for political and administrative unity, a desire which was hampered by their division into three administrative areas: the two trust territories of British and French Togoland and the British Gold Coast dependency. The mission

was instructed to report back on this subject to the 12th session of the council in November.

On Aug. 11 the emperor of Ethiopia ratified a new constitution for Eritrea and U.N. supervision over the former Italian colony came to an end. Under the arrangement, and pursuant to a general assembly resolution of Dec. 1950, Eritrea became an autonomous unit federated with Ethiopia and under the sovereignty of the emperor. (See also ATOMIC ENERGY; EDUCATION; LIBYA; PHILATELY; PRISONERS OF WAR; TRUST TERRITORIES; WORLD HEALTH ORGANIZATION.) (L. M. GH.)

United States. Revised figures of the 1950 census, released by the census bureau in 1952, placed the total population of the United States (including armed forces overseas) at 154,233,000 as of April 1, 1950. On Sept. 1, 1952, the current estimate of the bureau was 157,505,000 (for full details see the article CENSUS DATA, U.S.). As was natural in a presidential election year, the increase in population led to speculation as to possible increase in total vote. Early in the year it was thought that the increase would be as high as 16%. As the event proved, the increase was the greatest since 1880. (See ELECTIONS, U.S.) The reports of the census bureau, in comment upon steady increases and expectation of continued increase, emphasized the fact that while this process had been going on, the land useful for agriculture could now be materially increased only through mechanization, scientific utilization and public works. A real pressure of population on the land had appeared, and slightly less farm acreage was reported in 1950 than in 1945.

Economic Developments.—As the year opened, prosperous conditions were noted throughout the business structure; yet inflation seemed a continued certainty, with costs remaining high and profits and purchasing power equally certain to decline because of the impending tax burden. In presenting plans for tax revision, Pres. Harry S. Truman in his report to the congress on Jan. 16 wrote: "As 1952 opens, we face a period during which the burden of the defense program will increase greatly—both in absolute terms and relative to the total size and strength of the economy. This increasing burden, while indispensable to our security, will place an additional strain upon our manpower, our physical plant, our natural resources and our standard of living. It will inescapably cause Government expenditures to rise greatly, and, even with the additional taxes I am recommending, it is estimated that there will be a large deficit this year and a larger one next year." The president, in a message to the congress on Jan. 21, presented his budget estimates calling for \$85,000,000,000 for the fiscal year 1952-53. Of this, 76% was for "major national security programs," of which 60% was for military services. A total of \$5,000,000,000 was asked for the atomic energy program. (See also BUDGET, NATIONAL.)

Opposition to the president's program was expressed not only by Republican leaders, but by representatives of the Democratic party from both south and north. Sen. Paul Douglas of Illinois saw "catastrophe" in the growing tendency to accept "easy money" views. Sen. Harry F. Byrd of Virginia in particular attacked the dangers of continued inflation, and offered an alternative budget of \$76,000,000,000 as a possible way to escape deficit spending without injuring the "essential Government functions or the program of military security."

It was reported on July 1 that in the fiscal year ending June 30, 1952, the United States treasury showed a deficit of \$4,000,000,000. By midyear, employment was reported at the record point of 62,500,000.

Foreign Policy.—On Jan. 7, 1952, the British prime minister, Winston Churchill, arrived in the United States for discussions

"HELLO!" a 1952 cartoon by Hesse of the St. Louis Globe-Democrat

of military bases in England and the continuing crisis in the middle east, and primarily to "re-establish the close and intimate relationship that he had with President Roosevelt in wartime and to seek a common policy and approach on the grave problems facing the Western Alliance." Churchill made a bow to the United Nations, but emphasized in his public addresses the North Atlantic Treaty organization. He addressed congress on Jan. 17. On Jan. 28 congress granted \$300,000,000 to Great Britain "to support its defense program and contribute to maintaining the strength and stability which are essential to that program." Despite Churchill's assurances that "We welcome your patience in the armistice negotiations (in Korea) and our two countries are agreed that if the truce we seek is reached only to be broken our response will be prompt, resolute and effective," on his return to Britain, in answer to Labour party criticism, he said it meant no change in British policy.

Secretary of State Dean Acheson supported a suggestion made by Gen. Dwight D. Eisenhower on Jan. 21 to the effect that the western European nations call a constitutional convention "to examine and actually cope with problems of greater political and economic unity." Meanwhile, the meeting at Lisbon, Port., of the North Atlantic Treaty Organization council went forward, and Acheson on Feb. 29, in a national radio broadcast, reported agreement on five basic matters in this ninth meeting of the foreign ministers of the western European powers: (1) the forces to be made available to General Eisenhower's NATO command during 1952; (2) the bases and facilities to be built and maintained for these forces; (3) the creation of a European army by six nations, including western Germany; (4) the means by which return of west Germany to a place of equality and responsibility in the European community could be achieved; and (5) the reorganization and strengthening of the NATO structure. On May 27 in Paris, the representatives of 15 European nations signed agreements creating and guaranteeing a single unified European defense force and aiming as well to bind western Germany to the Atlantic defense system. (See also EUROPEAN

UNION; NORTH ATLANTIC TREATY ORGANIZATION.) This was hailed by Secretary Acheson as a great step toward peace in Europe, and when on June 11 he defended before the senate foreign relations committee the agreement on German rearmament, he found no opposition to the proposed alliances. It was notable that Republican as well as Democratic leaders were favourable to European unification policy.

That the policies of the administration in Europe and elsewhere were not to go unchallenged was signaled on Jan. 27 when Herbert Hoover addressed a nation-wide audience by radio and television. His position was that inasmuch as European nations were lagging in contribution to their own defense, the United States should withdraw most of its ground forces from Europe and build on the western hemisphere as the "bastion of liberty." Widespread approval was given this address. That the foreign policy of the administration was to be the subject of debate in the presidential campaign was also evident, and the issues were joined as a result of an address of Sen. Robert A. Taft of Ohio on June 1. He said that the policy of President Truman and Secretary Acheson from 1944 to 1952 had been "the most disastrous in the entire history of American foreign policy" and that so-called "bi-partisan foreign policy was a fraud."

Senator Taft declared he was not an isolationist, that he would not withdraw from Europe or from Korea, nor would he withdraw from the United Nations, but "do our best to amend the Charter so that action is based on international law and the adjudication of an impartial tribunal, and the veto power eliminated." He reiterated the position, so often stated by former President Hoover, that control of the sea and priority in the air, not the possession of overwhelming land forces, should be the basic military policy of the United States.

The year was marked by the participation of military men in political debate, including not only Generals Dwight D. Eisenhower and Douglas MacArthur, but also Albert C. Wedemeyer, formerly commander of United States forces in China, and Omar N. Bradley, chairman of the joint chiefs of staff. Gen. Bradley on March 20 attacked the "Gibraltar" theory of defense of Taft and Hoover as overemphasizing the strength of air and naval power.

In the midst of the presidential campaign, a conference on Pacific problems was held in Honolulu, T.H., attended by representatives of New Zealand and Australia, and led by Secretary Acheson. Britain was not asked to send representatives, nor

were France, the Netherlands or the Philippines. On Sept. 11 Acheson gave a full-length defense of the foreign policy of the administration in which he denounced the idea that it was merely "containment" of communism.

The insistence by the Soviet Union, on Oct. 3, that United States Ambassador George F. Kennan be recalled, led to a formal defense of Kennan by the state department, but he returned to the United States.

Treaty of Peace with Japan.—On April 15 President Truman signed the treaty of peace with Japan, in which 49 nations, not including the Soviet Union, had concurred, and by which Japan recovered full sovereignty on April 28. A separate treaty of peace between Japan and nationalist China was signed on that day, which marked the formal end of World War II in the Pacific area.

Korean War.—Throughout the year the people of the United States continued to view with deep misgiving the participation of the United States in the war in Korea. The widespread acceptance in 1950 and even in 1951 of duty within the United Nations gave way to an uncertain sense of obligation in that the United States appeared unable to bring about a successful termination of the war and yet was unwilling to withdraw its forces. British and U.S. policies on the extent of the war seemed nearer together than in 1951. Those opposing the prevailing U.S. policy included Senator Taft, who on Feb. 12 advocated arming Chinese nationalist forces on Formosa for invasion of the mainland of China.

The long-drawn-out so-called "truce negotiations," begun on July 8, 1951, continued at Panmunjom. By April 1 these "talks" had been going on for nine months, and were deadlocked over the matter of forced repatriation of prisoners, the United Nations representatives insisting that there should be no forced repatriation. On May 15 Gen. Mark W. Clark succeeded Gen. Matthew B. Ridgway as commander in the far east. General Ridgway reported in Washington "significant build up of the Soviet Union's Far Eastern military strength." General Clark let it be known that he would advise bombing China if the Communist Chinese air force attacked in strength in Korea. But the stalemate continued until in late October it was evident that a "new war" had come in Korea, for the North Korean-Chinese forces were using artillery as never before. In the closing days of his campaign for the presidency, General Eisenhower declared that he would "go to Korea" himself in the hope of finding a solution to the problems of the Korean war. By November hope was dim in the United States for a negotiated peace. (See also KOREAN WAR.)

The stalemate in Korea had profound effect upon public opinion in the United States. The administration maintained its position on war, united effort and continued negotiation. Opponents said mistakes had been made (1) in a land war in Korea; (2) in failing to follow General MacArthur's leadership; (3) in not naming the U.S.S.R. the "aggressor"; and (4) in working with Great Britain in the far east.

The result of this argument within the nation was a weakening of general foreign policy and a weakening of belief in the United Nations. Thus, belief in air power was strengthened, as was faith in General Eisenhower and interest in an aggressive foreign policy.

Meanwhile, the universal military training legislation before congress was thought inadequate in an atomic age. Although its advocates felt that "its enactment may shape the destiny of this nation and possibly the peace of the world for the rest of this century," the matter was nevertheless shelved on March 4. However, to enable release of 1,080,000 men and yet keep an army of 3,700,000 in readiness, the draft continued and plans were made to take 610,000 men for training between July 1,

UNIDENTIFIED PHENOMENA photographed by a U.S. coast guardsman at the Salem air station, Mass., on July 16, 1952. Coast guard spokesmen offered no opinion as to the cause or source of the "objects," but released the picture because of widespread public interest in "flying saucers"

1952, and July 1, 1953. (See also SELECTIVE SERVICE, U.S.)

Communism in the United States.—The discussion of Communism in the United States continued throughout the year and was emphasized by three developments: (1) the activity of Sen Joseph McCarthy of Wisconsin; (2) 14 Communists on trial in Los Angeles, Calif., found guilty; and (3) the position taken by loyalty boards. A group of 38 Republican senators signed a petition of nonconfidence in Philip C. Jessup as delegate of the United States in the United Nations assembly meeting in Paris. President Truman stood against the use of state department files by congressional investigating committees. Owen Lattimore spent 11 days before the senate internal security committee late in February and in early March. On July 2 the senate investigating committee reported on the conclusion of an 18-month inquiry into the Institute of Pacific Relations, declaring Lattimore "a conscious articulate instrument of Soviet conspiracy" and recommending perjury charges. In early December the justice department moved to indict Lattimore. Meanwhile, Gen. Walter Bedell Smith, head of the central intelligence agency, stated his belief that Communists were undoubtedly within this highly secret agency, as well as in other security organizations of the federal government. On Dec. 2 a federal grand jury reported that it had found a "definite, planned pattern" by which high officials of the United States government had surrounded themselves with disloyal persons who were later shifted to key posts in the United Nations organization. (See also COMMUNISM.)

Corruption.—Late in January the house judiciary committee, without a dissenting vote, ordered a full-scale investigation of the department of justice. On Feb. 1, the president appointed Newbold Morris of New York special assistant to Atty. Gen. James Howard McGrath to investigate the charges. In accepting, Morris said he would conduct a nonpartisan investigation (not prosecution) "to clean up the spoils system in government." Morris developed his plan despite heavy criticism of his powers and of his record. He proceeded to issue a questionnaire; McGrath denied his power, the president upheld Morris and McGrath dismissed Morris.

Then Truman, with whom the attorney general had long been associated in politics, accepted the resignation of McGrath and appointed a federal judge, James P. McGranery, as attorney general. The matter of investigation was dropped.

Labour.—The first six months of the year were marked by a struggle in the steel industry. On Dec. 31, 1951, it had been announced that the members of the United Steel Workers of America, an organization of the Congress of Industrial Organizations, were prepared to strike on the issue of an increase in wages, and early in April this strike was threatened. On April 8 President Truman seized the steel industry to prevent the nation-wide walkout. Management sought injunctions against seizure. In late April Judge David A. Pine of the federal district court ruled that the president's seizure was unconstitutional and ordered return of the plants to private management. The steel workers began the threatened walkout, but the United

States court of appeals granted a stay of the order restoring the steel plants to the companies and at President Truman's request the strike was called off, pending the decision of the supreme court in this case.

On June 2 the supreme court ruled that the president's seizure of the steel industry was unconstitutional. A 54-day strike of the steel workers followed the return of the plants to private management. The president appealed to the congress for a law permitting seizure in a national emergency. The senate rejected this appeal and urged use of the Taft-Hartley law. The president rejected this proposal. So dangerous to the national defense was the stoppage of work that the president threatened to seize certain mills under the Selective Service act. Finally, just before the close of the Democratic national convention, the president summoned the leaders of labour and management to the White House, and an agreement was signed in his presence by Philip Murray of the United Steel Workers and Benjamin Fairless, president of the United States Steel corporation. It was a total victory for no one. The strike at its various stages had been marked by three significant developments: (1) serious interference with defense production; (2) positions of far-reaching import taken by both the president and the supreme court; (3) limitation of the power of the Wage Stabilization board.

In May the three-year-old railroad labour dispute had been brought to an end when three operating unions, Brotherhood of Locomotive Engineers, Order of Railway Conductors and Brotherhood of Locomotive Firemen and Enginemen, accepted the terms worked out by the representative of the president. The settlement, which provided substantial wage increases, was accepted reluctantly by the unions. They had protested against government seizure and labour injunctions. The railways, which had been under nominal operation by the army since their seizure in Aug. 1950, were returned to private management. (See also LABOUR UNIONS; RAILROADS; STRIKES; WAGE STABILIZATION BOARD.)

Immigration.—The McCarran-Walter Immigration and Nationality bill was passed by the senate on June 11 after passing the house by a vote of 203 to 53. On June 25 President Truman vetoed the bill as discriminatory and crippling to United States foreign policy. The bill, 300 pages in length, was the result of 3 years of study by congressional committees in an attempt to codify the immigration laws that had accumulated during 30 years. Despite "improvements" noted by the president, he claimed that the bill would not only continue an "outdated national origins quota system," but would actually place the rights of some citizens in jeopardy. The house of representatives, nevertheless, on June 26 voted 278 to 113 to pass the bill over the president's veto, and the following day the senate overrode the president's veto by a 57 to 26 vote. The new law provided for the annual admission of 154,658 persons, 308 more than could

CABINET APPOINTMENTS made by President-elect Eisenhower. Left to right: John Foster Dulles, secretary of state; George M. Humphrey, secretary of the treasury; Herbert Brownell, Jr., attorney general; Arthur E. Summerfield, postmaster general; Douglas McKay, secretary of the interior

Table I.—Major Legislation Passed by U.S. Congress in 1952

Act	House Vote	Senate Vote	Date of Enactment
Treaty of Peace with Japan		66-10 Yeas: D. 38, R. 28 Nays: D. 1, R. 9 (March 20)	Instrument of ratification signed April 15
Railroad Unemployment Insurance act amendment (Increased unemployment and sickness benefits to maximum of \$7.50 and minimum of \$3 per day)	Passed by voice vote (May 5)	Passed by voice vote (April 24)	Signed May 15
Armed forces pay increase (Provided for a cost-of-living pay increase of 4% and a 14% increase in food and rental allowances for all members of the armed forces)	333-0 Yeas: D. 161, R. 171, Ind. 1 Present: R. 1 (May 15)	Passed by voice vote (May 15)	Signed May 19
Mutual Security Act of 1952 (Authorized omnibus appropriation of \$6,447,730,750 for U.S. economic, military and technical aid to foreign nations in period July 1, 1952-June 30, 1953)	230-115 Yeas: D. 157, R. 73 Nays: D. 26, R. 89 Present: R. 1 (June 5)	59-11 Yeas: D. 41, R. 18 Nays: D. 1, R. 10 (June 9)	Signed June 20
Immigration and Nationality act (Revised laws relating to immigration, naturalization and nationality)	203-53 Ayes: 203 Noes: 53 (June 10)	Passed by voice vote (June 11)	Vetoed June 25 Veto overridden House 278-113 Yeas: D. 107, R. 170, Ind. 1 Nays: D. 90, R. 23 Senate 57-26 Yeas: D. 25, R. 32 Nays: D. 18, R. 8 Enactment date June 27
Marine corps—strength, status (Fixed strength of marine corps at not less than three combat divisions and three air wings and stipulated that commandant is to have coequal status on the joint chiefs of staff in considering any matter directly concerning the marine corps)	Passed by voice vote (June 19)	Passed by voice vote (June 19)	Signed June 28
Defense Production Act Amendments of 1952 (Authorized continuation of wage and price controls to April 30, 1953, rent control to Sept. 30, 1952, and priorities and allocations to June 30, 1953; created new Wage Stabilization board without dispute authority; requested President Truman to use the Taft-Hartley act in the steel labour dispute)	194-142 Yeas: D. 127, R. 66, Ind. 1 Nays: D. 38, R. 104 (June 28)	Passed by voice vote (June 28)	Signed June 30
Puerto Rican constitution (Approved upon certain conditions the constitution of Puerto Rico adopted March 3, 1952)	Passed by voice vote (June 30)	Passed by voice vote (July 1)	Signed July 3
Emergency Powers Continuation act (Extended 48 presidential emergency war powers for duration of national emergency proclaimed Dec. 16, 1950, and six months thereafter, but not beyond April 1, 1953)	Passed by voice vote (July 2)	Passed by voice vote (July 3)	Signed July 5
Department of defense appropriation act, 1953 (Appropriated \$46,610,938,912 for U.S. armed forces in period July 1, 1952-June 30, 1953)	Passed by voice vote (July 5)	Passed by voice vote (July 5)	Signed July 10
Resale price maintenance (Amended Federal Trade Commission act to authorize contracts and agreements establishing minimum or stipulated resale prices on brand-name items which are extended by state law to persons not parties thereto)	196-10 Ayes: 196 Noes: 10 (May 8)	64-16 Yeas: D. 35, R. 29 Nays: D. 10, R. 6 (July 2)	Signed July 14
Veterans' Readjustment Assistance Act of 1952 (Authorized educational and training allowances for persons who served in the armed forces on and after June 27, 1950)	322-1 Yeas: D. 172, R. 149, Ind. 1 Nays: D. 0, R. 1 (July 4)	Passed by voice vote (July 4)	Signed July 16
Social Security act amendments of 1952 (Increased monthly benefits by 12½% or \$5, whichever is larger, where benefits are based on pre-1951 earnings and by \$5 in most cases where based on post-1950 earnings)	Passed by voice vote (July 5)	Passed by voice vote (July 5)	Signed July 18
Farm parity formula extension (Extended through the 1954 crop year the current method of computing parity prices for basic farm commodities)	Passed by voice vote (July 5)	Passed by voice vote (July 5)	Signed July 17
Peace contract with the German Federal Republic (Freed German Federal Republic from all Allied controls except those relating to defense and defined relations with the U.S., the U.K. and France)		77-5 Yeas: D. 45, R. 32 Nays: D. 0, R. 5 (July 1)	Instrument of ratification signed Aug. 2

previously be admitted. Racial barriers to immigration were literally removed by a small quota (2,000) admissible from Asiatic countries, and the ban to naturalization of people of Asiatic birth, now resident in the United States, was wiped out. Foreigners married to women citizens of the United States might henceforth enter the country without reference to quotas, as might the foreign brides of servicemen, and certain foreign

members of families established in the country might be exempt from literacy tests for entry. But provisions for the admission, exclusion and deportation of aliens dangerous to the national security were strengthened by the law, and a system of selective immigration instituted whereby top priority would be given those having superior education or skills needed in the country. (See also IMMIGRATION AND EMIGRATION.)

Transition of Power.—The election of Dwight D. Eisenhower to the presidency on Nov. 4 reflected one of the "tidal sweeps" of United States political history. Abrupt changes had been provided in the election of Abraham Lincoln in 1860, of Warren

CABINET APPOINTMENTS made by President-elect Eisenhower. Left to right: Ezra T. Benson, secretary of agriculture; Sinclair Weeks, secretary of commerce; Martin P. Durkin, secretary of labour; Charles E. Wilson, secretary of defense; Oveta Culp Hobby, federal security administrator. Mrs. Hobby, while not holding an office of cabinet rank, was to attend cabinet meetings

"READING HIS EPITAPH AGAIN," a 1952 cartoon by Parrish of the *Chicago Tribune*

G. Harding in 1920 and of Franklin D. Roosevelt in 1932; yet each of these upheavals had been a party triumph, and the leader had been less important than the movement of the masses in the direction he seemed to point. In 1952 the leader was of primary importance, and this fact was the most significant aspect of the election.

Pressure of problems and need of immediate action were reflected in the swift moves made by the outgoing and the incoming administration to achieve a transition of power at an earlier date than ever before in the history of the United States, that is, on Jan. 20, 1953. However, it was repeatedly pointed out that the representatives of President-elect Eisenhower were in Washington during the "interregnum" as "observers" only. In addition to pressing problems in foreign relations, finance, foreign trade and taxes, two major questions presented themselves throughout the campaign and became increasingly critical as the year ended: (1) How would Eisenhower, as president and Republican party leader, deal with the basic divisions on foreign policy within the Republican membership of the senate and house? (2) How would Eisenhower deal with the schisms within the United Nations on matters involving European aid, the Korean war and the continued soviet policy of obstruction of the majority of the members of the United Nations?

Another question of vital importance was this: what would become of the Democratic party? It was a question in any political discussion, despite the fact that the Democrats had polled 45% of the popular vote for president and had heavy minority representation in both senate and house. The question arose because it appeared that party organization had disintegrated in the course of the campaign. The southern Democrats still held important committee assignments in congress. Although Adlai Stevenson became titular leader of his party, as admitted by President Truman, only among "liberals" and "independents" was Stevenson generally accepted as the leader for the next four years. President Truman and his administrative colleagues would relinquish power on Jan. 20, 1953. Inasmuch as their program in both domestic and foreign affairs was to be replaced, they were the new government's "loyal opposition" in the public eye. It seemed unlikely that Truman would disappear as a party leader. Moreover, it seemed probable that Stevenson as leader

would support many policies of the new administration. There was some expression of belief that as Eisenhower's program would develop, a realignment of power would appear within both the Democratic and Republican parties.

The meeting of President Truman and President-elect Eisenhower on Nov. 18 was unprecedented except for the meetings of Hoover and Roosevelt in Nov. 1932 and Jan. 1933, when effort had been made to achieve co-operation on both foreign and domestic policies. This earlier effort had not been productive, and it was well said of the Truman-Eisenhower meeting that Truman had the power but not the leadership, and Eisenhower had the leadership and not the power. The constitutional provision for postponement of transfer of power until Jan. 20 was responsible for this situation. Despite the impasse, representatives designated by Eisenhower (Henry Cabot Lodge, Jr., and Joseph M. Dodge) were brought into conference with representatives of the president. This had been the president's suggestion. It was pointed out that this "was the first time in American history that specific arrangements for an orderly and informed transfer of power" had been made. Meanwhile, by conferring with both Thomas E. Dewey and Robert A. Taft and numerous other party leaders of many shades of opinion and of varying record in politics, Eisenhower maintained his position, taken in the campaign, of holding together the factions of the Republican party. (See also ELECTIONS, U.S.; POLITICAL PARTIES, U.S.)

On Nov. 20 it was announced that President-elect Eisenhower had invited John Foster Dulles (as secretary of state), Charles E. Wilson of General Motors (as secretary of defense) and Douglas McKay, governor of Oregon (as secretary of the interior) to become members of his cabinet. The next day came the news of invitations to George Humphrey of Cleveland, O., to be secretary of the treasury, Herbert Brownell, Jr., to be attorney general and Harold E. Stassen to be Mutual Security director. By Dec. 2 the proposed cabinet was completed with the addition of Ezra Taft Benson as secretary of agriculture, Martin P. Durkin as secretary of labour, Arthur E. Summerfield as postmaster general and Sinclair Weeks as secretary of commerce, and the president-elect had announced as well the names of a number of men and women designated for important administrative positions at home and abroad. (See also articles on the various states.) (E. E. R.)

Foreign Credits of the U.S. Government.—Utilization of foreign credits extended by the U.S. government exceeded \$659,000,000 in the fiscal year ended June 30, 1952, an increase of more than one-half over the preceding year's total. Principal collections on foreign credits did not increase as markedly in the same period. Nevertheless, principal collections of \$334,000,000 still aggregated more than half of total utilizations. Net credit utilization in the fiscal year 1952 was almost double that in the prior 12-mo. period, raising the total indebtedness of foreign countries to the U.S. government by \$325,000,000. The amount outstanding as a result of U.S. government foreign-lending programs since the creation of the Export-Import bank (in 1934) stood at \$10,442,000,000 on June 30, 1952. During the fiscal year 1952 the U.S. government collected \$183,000,000 in interest and commissions on these outstanding credits.

Utilization of \$172,000,000 from the special wheat credit to India comprised more than one-half of net credit utilizations for the fiscal year 1952. Western European nations and dependencies drew \$229,000,000 in loans from the Mutual Security program; these utilizations were offset by large repayments during the year against early post-World War II credits to France, the Netherlands and the United Kingdom.

Credit aid constituted more than one-eighth of the total gross foreign aid by the U.S. government (grants and credits com-

URANIUM PROSPECTOR setting up a Geiger counter to retest old diggings at Temple mountain, Utah. In addition to the efforts of private individuals and companies, about \$3,000,000 was spent by U.S. government agencies in tracking down new uranium sources in 1952

Uranium. The frantic scramble for the discovery and development of new sources of uranium continued in 1952. For the time being the major emphasis was on uranium as a source material for atomic weapons. In the first phase of the search the old-time whiskered prospector with his burro and gold pan made way for the young scientist and his Geiger counter, wandering in out-of-the-way places, some promising and others not; such broadcast methods resulted in many new discoveries, but were slow and tedious. A second phase led to a careful scrutiny of various operations handling minerals in large quantities, on the theory that the ores might contain minute quantities of uranium which could be recovered as a by-product; this method also proved profitable as evidenced by processes for the recovery of traces of uranium from phosphate rock and from the gold ores of South Africa. In a third phase, to overcome the slow progress of ground work, prospecting took to the air. Aeroplane surveys using suspended scintillation counters were made in Saskatchewan, Colorado and Utah, thus covering in a day an area that would require a year's work by a ground crew, and at less cost per acre.

The British and U.S. governments were jointly financing the plant investment required for the recovery of uranium from South African gold ores. The first of a series of a dozen plants was scheduled to start operation about midyear of 1952.

In the United States, while the Colorado plateau area continued to be the heaviest producer, several mines were operating in the Marysville district of Utah, and scattered discoveries had been made elsewhere, as well as extensions of established

producing areas. Processing plants were distributed throughout the producing areas, the ninth plant being under construction in 1952. (See also ATOMIC ENERGY.) (G. A. Ro.)

Uruguay. A republic in southeastern South America, Uruguay is bounded on the north by Brazil, on the south by the Rio de la Plata, on the east by the Atlantic ocean and on the west by Argentina. It is the smallest country in South America, with an area of 72,172 sq.mi. It has a population of 2,365,000 (official est., Dec. 1949), mostly of European extraction. Montevideo, the capital, has 850,000 inhabitants (1947 est.). Other leading cities are Paysandú (50,000); Salto (48,000); Mercedes (33,000); and Minas (32,000). Religion: Christian, mostly Roman Catholic. Chairman of the governing council in 1952: Andrés Martínez Trueba.

History.—During 1952 Uruguay's political life remained stable and its economy, although affected by high living costs and inflation, was under control so that it did not have any adverse effects on the life of the nation.

Wool and meat, the most important products for export, continued to bring high prices and their demand remained stable. The decline of Argentine production helped Uruguayan foreign trade. The government adopted a policy of strict control on local prices which helped to ease living costs.

A step toward further democratization of the government and ensuring against the emergence of a strong executive with authoritarian ideas was taken when the presidency was abolished. In its place a governing council (*ejecutivo colegiado*) was adopted. The new council, made up of nine members, six representing the majority Colorado party and three the minority party, took office on March 1. Andrés Martínez Trueba, the outgoing president, was elected chairman of the new council, which was to hold office for three years to complete the current term. Thereafter the term would be for four years and members would not be eligible for re-election. The council would perform the executive functions of the government and would have a cabinet of nine ministers to assist it.

Relations with Argentina remained strained throughout the year. The establishment of the Argentine Exile association in Montevideo, a group of political refugees from the Perón regime dedicated to maintaining close association among themselves and to promoting political activity, constituted another hindrance in the relations between the two countries. (J. McAd.)

Education.—In 1950 there were 546 urban schools with 157,033 pupils and 1,176 rural schools with 55,476 pupils. The total number of teachers was 6,744. There were also 191 private schools with 36,884 pupils. The University of Montevideo had 11,948 students. In 1950, 25,457,117 pesos were allocated for primary education and 7,047,140 pesos for the university.

Finance.—The monetary unit is the peso, valued at \$0.5263 U.S. currency, controlled rate; \$0.4082, commercial free rate; and \$0.3378, uncontrolled rate, on Sept. 17, 1952. The 1952 budget estimated revenue at 456,100,000 pesos and expenditure at 456,156,000 pesos. Actual government expenditure in 1951 was 367,000,000 pesos; revenue, 357,500,000 pesos. Autonomous entities operated at a loss of 12,600,000 pesos. The internal public debt was 786,185,000 pesos on May 31, 1952; external, 112,623,000 pesos. Currency in circulation at the end of July 1952 amounted to 302,900,000 pesos; demand deposits 407,800,000 pesos; gold reserves \$211,000,000; dollar exchange in U.S. banks \$102,000,000. The cost of living index for Montevideo stood at 132 in July 1952 (1948=100).

Trade and Communications.—Exports in 1951 totalled \$236,330,000; imports (excluding gold valued at \$63,627,000), \$309,389,000. Chief exports were wool (41%), beef and mutton (16%), hides, skins and leather (10%) and linseed oil (4%); leading imports, raw materials (including sugar, iron and steel and cotton) (30%), vehicles (16%), machinery (15%) and fuel and lubricants (9%). Leading customers were the U.S. (43%), British Commonwealth (20%), Belgium (5%) and France (4%); leading suppliers, the U.S. (38%), British Commonwealth (16%), Brazil (7%) and France (6%).

Railways (1948) totalled 1,874 mi.; in 1951 they carried 10,899,000 passengers and 1,883,645 metric tons of freight. Highways (1948) totalled 26,000 mi., of which 3,051 mi. were paved national roads. On Dec. 31, 1949, there were 56,500 automobiles and 20,000 trucks. According to *Lloyd's Register of Shipping*, the merchant marine had 44 steamers and motor ships (100 tons and over) aggregating 70,222 gross tons on June 30, 1951.

Agriculture.—Official production estimates for major crops in the crop year 1951-52 (in metric tons) included wheat 472,571; linseed 119,946;

oats 39,762; malt barley 10,203; ordinary barley 7,926; rice 46,104; maize (1950-51) 278,467. The 1951 agricultural census showed 23,408,642 sheep, 8,154,109 cattle, 511,547 milk cows, 667,251 horses and 258,980 pigs. Wool exports in the wool year 1951-52 (Oct. 1-Sept. 30) were 103,041 bales, of which 59,807 bales went to the U.S., 15,630 bales to the United Kingdom and 4,875 bales to Germany. Meat exports in 1951 included 62,202 metric tons of frozen beef, 12,633 tons of canned beef and 4,857 tons of frozen mutton.

Manufactures.—There were four *frigoríficos* for treating meat, eight *saladeros* and seven meat-canning plants in 1952. (J. W. Mw.)

U.S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Utah. A Rocky mountain state of the United States, admitted to the union in 1896, Utah is popularly known as the "Beehive state." Area: 84,916 sq.mi. (82,346 sq.mi. land; 2,570 sq.mi. water); pop. (1950 census) 688,862 (est. July 1, 1951) 709,000.

Capital: Salt Lake City (1950 census) 182,121. Other principal cities with 1950 census figures were Ogden, 57,112; Provo, 28,937; Logan, 16,832.

History.—The chief officers of Utah in 1952 were J. Bracken Lee, governor; Heber Bennion, Jr., secretary of state; Reese M. Reese, auditor; Ferrell H. Adams, treasurer; Clinton D. Vernon, attorney general; E. Allen Bateman, superintendent of public instruction.

In the Aug. 1952 primary election, incumbent Sen. Arthur V. Watkins defeated Marriner S. Eccles for the Republican nomination for senator. Other Republican contests found J. Bracken Lee the nominee for governor to succeed himself; Douglas R. Stringfellow, nominee from the 1st congressional district; and William A. Dawson, nominee from the 2nd congressional district. For the Democrats, Rep. Walter K. Granger defeated former Gov. Herbert B. Maw for the nomination for senator. In other Democratic contests, Mayor Earl J. Glade of Salt Lake City bested Secretary of State Heber Bennion, Jr., in the closest contest of the election; Ernest R. McKay won the nomination in the 1st congressional district; and incumbent Reva Beck Bosone won in a landslide the nomination in the 2nd congressional district. The total vote cast was approximately 152,000, about 30,000 more than had ever been cast in a Utah primary since the adoption of the primary system in 1938. The vote cast was about 37% of the 414,000 voters which the U.S. census estimated to be the total Utah population of voting age. (For results of the November elections, see the article ELECTIONS, U.S.)

Education.—For the 1951-52 school year there were 103,211 full-time elementary students and 65,235 full-time secondary students enrolled in the Utah schools. This total of 168,446 students was an increase of 11,769 over the 1950-51 figure. During 1951-52 the elementary schools employed 2,826 teachers or a total instructional staff of 3,240 (including principals, supervisors, etc.); the secondary schools employed 2,272 teachers or a total instructional staff of 2,489. Total expenditures for education in Utah in 1950-51 amounted to \$39,375,661.91.

Social Insurance and Assistance, Public Welfare and Related Programs.—Total expenditures for public assistance during the fiscal year July 1951 to June 1952 amounted to \$13,241,877.23 (for 24,700 persons) which was an increase of \$1,365,236.22 over the 1951 total. The funds were distributed as follows: old-age assistance \$6,314,488.13 (10,127 persons); aid to dependent children \$3,813,944.21 (10,470 persons); aid to the blind \$154,056.38 (246 persons); aid to the disabled \$1,046,457.73 (1,663 persons); aid to unemployables \$646,138.85 (1,059 persons); aid to employables \$180,466.36 (600 persons); foster care \$274,573.44 (535 persons); medical care and sight conservation \$12,368.43; welfare services \$142,930.33; and administration \$656,453.37.

For the fiscal year July 1951 to June 1952 the four Utah state welfare institutions reported the following expenditures and populations: industrial school at Ogden, approximately \$275,000 and 165 students; mental hospital at Provo, approximately \$1,000,000 and 1,360 inmates; training school at American Fork, approximately \$475,000 and 740 students; and the tuberculosis sanatorium at Ogden, approximately \$115,000 and 85 patients.

Communications.—On Jan. 1, 1952, there was a total of 30,211 mi. of road in the state, including the following: state road mileage 5,472; county road mileage 16,107; city street mileage 2,917; and federal road mileage 5,715. Total expenditures by the Utah state road commission for the year ending Dec. 31, 1951, amounted to \$12,709,354 of which \$7,966,179 was spent for construction, \$514,905 for securing rights-of-way, \$2,607,018 for maintenance, \$664,021 for equipment rentals and sales, and \$957,231 for miscellaneous expenditures. Motor vehicle registration reached 289,455 vehicles by Sept. 30, 1952, including 228,140 passenger cars. As of Jan. 1,

1952, operating railroads had a combined mileage of 1,977.22 mi., but by Sept. 1952, the Bamberger Electric Railway, extending from Ogden to Salt Lake City, had petitioned the state for authorization to substitute buses for the streetcars.

Banking and Finance.—The 45 state banks had total assets of \$389,986,763.50 as of June 30, 1952. On that date the ten national banks reported total assets of \$291,198,177.63. There were 13 state-chartered savings and loan associations with total investment accounts of \$50,564,399. The six federal building and loan associations reported total assets of \$42,911,934.

State receipts for the fiscal year ending June 30, 1952, were \$95,399,115; disbursements for the same period amounted to \$88,476,881. The total state debt on June 30, 1952, was \$470,000 which was to be completely amortized by March 1, 1955, as result of a bond retirement fund created by the 1943 legislature.

Agriculture.—Total farm income for Utah for 1951 reached \$199,286,000 of which livestock and products amounted to \$142,533,000, crops amounted to \$45,468,000, government payments amounted to \$3,164,000, and products consumed on farm totalled \$8,121,000. The total value of crops exclusive of livestock and products for 1951 amounted to \$87,118,000.

Table I.—Principal Agricultural Products of Utah

Crop	Indicated 1952	1951	Average, 1941–50
Wheat, bu.	8,079,000	9,081,000	7,236,000
Barley, bu.	6,624,000	6,072,000	5,757,000
Oats, bu.	2,162,000	1,886,000	2,106,000
Corn, bu.	1,188,000	1,147,000	831,000
Potatoes, bu.	3,175,000	2,316,000	2,938,000
Sugar beets, tons	322,000	403,000	520,000
Hay (all), tons	1,234,000	1,023,000	1,154,000
Apples, bu.	347,000	493,000	441,000
Peaches, bu.	648,000	800,000	646,000
Pears, bu.	276,000	198,000	156,000
Celery, crates	331,000	295,000	306,000
Tomatoes, bu.	60,000	50,000	48,000

Manufacturing.—In 1951, the average workers per month in the principal industries of the state increased by 8,118. The total wages for 1951 surpassed those of 1950 by \$58,666,522. (B. D. M.)

Table II.—Principal Industries of Utah

Industry	Av. workers per month	Total wages 1950
Mining	13,230	\$ 56,990,716
Contract construction	13,027	49,881,784
Manufacturing	31,253	108,946,279
Transportation, communication and utilities.	10,539	34,114,717
Wholesale and retail trade	46,214	126,705,882

Vandenberg, Hoyt Sanford (1899–), U.S. air force chief of staff, was born on Jan. 24 in Milwaukee, Wis. He graduated from the U.S. Military academy at West Point, N.Y., in 1923 and served in

various capacities in the U.S. until May 1929 when he went to Schofield Barracks, Hawaii, to join the 6th pursuit squadron, of which he assumed command in Nov. 1929. He became an instructor at the Air Corps Tactical school and in Sept. 1938 entered the Army War college, being graduated in June 1939. He next served in the plans division of the office of the chief of the air corps in Washington, D.C., and became operations and training officer of the air staff in Washington after the U.S. entered World War II. In June 1942 he was assigned to the United Kingdom, and helped plan the air participation in the North African campaign. On Feb. 18, 1943, he became chief of staff of the northwest African strategic air force. Returning to the U.S. in Aug. 1943, he was deputy chief of air staff, and in 1944 commanded the U.S. air component in the Allied expeditionary force, assuming command of the 9th air force in Aug. 1944. He was named chief of staff of the air force on April 30, 1948.

On Feb. 19, 1951, he agreed in testimony before a senate committee that air and sea forces alone could not prevent Soviet forces from overrunning Europe.

Vandenberg, recovered from a serious illness in 1951, was re-appointed chief of staff of the air force on March 6, 1952, for another 14-month term.

Van Fleet, James Alward (1892–), U.S. general, was born on March 19 in Coytesville, N.J. He studied at the Summerlin institute in Bartow, Fla., attended the U.S. Military academy and was graduated in 1915. He saw action in France during World War I, served with U.S. occupation forces, and was assigned to a series of military education posts during the 1920s and early 1930s. As the pre-World War II defense program expanded, he was named commanding officer of the 8th infantry regiment of the 4th division, and he eventually led this regiment in the invasion of Normandy. He commanded the 4th infantry division in operations against the Siegfried line, the 90th division in crossing the Moselle and the 3rd corps in the advance into Germany.

On Feb. 6, 1948, Pres. Harry S. Truman named him to direct the U.S. military groups on duty in Greece, where he had much to do with the eventual ousting of the Communist guerrilla forces. On April 11, 1951, he was appointed to succeed Gen. Matthew B. Ridgway as U.S. 8th army commander in Korea, in the reshuffling of commands that followed the removal of Gen. Douglas MacArthur. He was named a four-star general by President Truman on July 9, 1951. Throughout the protracted truce negotiations in 1951 and 1952, Van Fleet expressed full confidence that the U.N. forces would decisively defeat any new Communist offensive in Korea.

Varnishes: see PAINTS AND VARNISHES.

Vatican City State. This sovereign independent state was established by the Lateran treaty between the Holy See and the Italian government on Feb. 11, 1929. The treaty was recognized in international law, with the reigning pope as sovereign. The area of Vatican City is 108.7 ac., excluding the papal estate of Castel Gandolfo and certain basilicas in Rome which are extraterritorial. Executive powers are exercised by the governor, responsible to the pope.

The Vatican sent 51 representatives, including nuncios, inter-nuncios, apostolic delegates and other representatives, to other countries. Diplomatic representatives were assigned to the Vatican by 41 countries.

Pope Pius XII sent a representative to the United Nations for the first time in May 1952 to sign an international treaty to promote the welfare of refugees.

In an apostolic constitution Pope Pius provided for the estab-

lishment of a supreme council on emigration, under the jurisdiction of the Sacred Consistorial Congregation, and defined the functions under it of the delegate for emigration.

A copy of the *Princeton Index* was presented to the Vatican library by Francis Cardinal Spellman, archbishop of New York. The index, through its large collection of 100,000 photographs, brought together an organized volume of material which was not previously available to the scholar and research worker.

The Sacred Congregation of the Holy Office placed on the *Index of Forbidden Books* eight Italian books dealing with Padre Pio, Capuchin priest and reputedly a stigmatic. All works of André Gide, French novelist, were placed on the *Index* and all works of Alberto Moravia, Italian neorealist novelist.

The Sacred Congregation of the Holy Office issued a pronouncement condemning "corrupt and errant forms of sacred art" which had found their way into the churches and instructed bishops to resist certain tendencies in modern art which, by producing works "deformed or grotesque or hideous," pervert religious art's basic purpose.

The Sacred Congregation for the Propagation of the Faith issued an instruction regularizing mission collections by religious orders and other agencies. The instruction was particularly concerned with the status of pontifical mission organizations and the relations of other groups to them. (See also PIUS XII; ROMAN CATHOLIC CHURCH.) (J. LAF.)

Veal: see MEAT.

Vegetable Oils and Animal Fats.

Production in the U.S. of these several oils and fats was forecast at 11,815,000,000 lb. for the year beginning Oct. 1, 1952—a decline of about 400,000,000 lb. from the very high levels of 1950 and 1951, but far above the pre-World War II average of 8,696,000,000 lb. Consumption of the edible types by U.S. civilians in 1952 was indicated at 43.7 lb. per capita, about 5% more than in 1951 but only 98% as much as the prewar average.

U.S. Production of Principal Fats and Oils*

(In millions of pounds)

	1952†	1951‡	1950	Average, 1937-41
Butter	1,370	1,405	1,472	2,220
Lard	2,650	2,920	2,811	2,091
Edible tallow	180	170	158	225
Edible vegetable oils	4,565	4,685	4,397	2,253
Soap fats and oils	2,370	2,375	2,504	1,523
Drying oils	655	625	899	363
Other oils	25	25	32	21
Totals	11,815	12,205	12,273	8,696

*Year beginning October.

†Forecast. ‡Preliminary.

The total crop of the four oilseeds was a new record, 2% more than the previous high (1951) and about one-third larger than average. Soybeans made up more than half the total and cottonseed about one-third. Flaxseed production totalled 31,033,000 bu., compared with 33,802,000 bu. in 1951 and an average for the decade 1941-50 of 38,056,000 bu.; peanuts, 1,225,145,000 lb., compared with 1,676,125,000 lb. in 1951 and an average of 2,042,448,000 lb. for 1941-50. Butter production declined about 35,000,000 lb., compared with 1951. Consumption dropped to 8.7 lb. per capita for U.S. civilians, 9% less than in 1951 and 52% of the prewar level. Lard and rendered pork fat production declined by nearly 10% because of smaller pig crops.

Margarine use in 1952 was estimated at 7.7 lb. per capita, or 18% more than in 1951.

Soap fats and oils production remained on nearly the same level as in 1951, but far above average. Total domestic use in 1951-52 was about 20% less than a year earlier, partly because soap inventories were high and expansion continued in the sale

of synthetic detergents.

Of the 8,702,000,000 lb. of edible fats and oils, including butter, distributed in 1951-52, 81.9% went to U.S. civilians, 15.6% to export markets and smaller amounts to the U.S. military and possessions. Exports of food fats and oils for the year amounted to 1,358,000,000 lb., 30% more than the 1,045,000,000 lb. of the previous year, and indicated as a new record tonnage.

Prices for most fats and oils were lower to weak during 1952, with lard down 55% or more below its post-Korean war peak. In October the general level for fats and oils was about 25% lower than a year before, with the inedible soap fats and oils especially hard hit. Price-support programs to producers were in effect on several of the U.S.-produced oils and oilseeds: cottonseed at \$62.40 per ton (season's average forecast at \$69.30 per ton); soybeans at \$2.56 per bushel (season's average forecast at about \$2.70 per bushel); butterfat at 69.2 cents per pound; tung nuts at \$67.20 per ton; olive oil at \$2.50 per gallon; peanuts at 11.97 cents per pound; and flaxseed at \$3.77 per bushel.

Imports into the U.S. in 1951-52 of vegetable oils (expressed) were valued at \$85,300,000, 28% less than the \$119,000,000 of the previous year. Oil-bearing materials declined even more sharply, by 45%, to \$68,800,000 from \$125,000,000 in the preceding year.

World-wide, the fats and oils situation was eased. Even Japan's fat balance was indicated as markedly improved. World prices, led by U.S. and Indian markets, weakened, especially as regards lard, soybean oil, cottonseed oil and peanut oil. India set quotas on exports of linseed oil, peanuts and peanut oil. Production and exports of copra, coconut oil and palm oil in most producing areas tended to decline in 1952; there were some expectations of increased production in 1953. Norway's cod-liver oil production approximated the 1951 total of 3,170,000 gal. Spain, with a large 1951-52 olive oil crop of 770,000 tons, relaxed the previous rationing. A preview of the olive oil crop of the Mediterranean basin indicated only about 700,000 short tons, compared with a record 1,600,000 tons in 1951. Antarctic outturn of whale oil in 1951-52 totalled 408,000 tons. World production of sperm oil in 1952 was below the record 118,000 tons of 1951. (See also COTTON; PEANUTS; SOYBEANS.)

(J. K. R.)

Vegetables. Commercial truck-crop production in the U.S. for the fresh market in 1952, based on 25 vegetables and not including strictly market garden areas nor farm gardens, was forecast at about 8,552,300 tons, 3% smaller than in 1951 but 5% above the average for the preceding decade. Acreage was indicated at 1,764,870 ac., 1% more than in 1951 but only 95% as much as the 1941-50 average.

Amendment of the Defense Production act during 1952 prohibited price ceilings on fresh and processed vegetables. Prices were higher than in 1951. Exports of vegetables in 1951-52 accounted for only 1.4% of the total fresh vegetable production and 1.6% of the processed pack.

In Europe, it was indicated that the area under vegetables in 11 net importing countries in 1951-52 was 638,000 ha., compared with 675,000 ha. in the previous year and an average for 1947-48 to 1950-51 of 722,000 ha.; in 5 exporting countries the area in vegetables was 732,000 ha. in 1951-52 against an average for earlier postwar years of 684,000 ha., suggesting a shift away from local self-sufficient production at all costs toward trade expansion.

Commercial Truck Crops for the Fresh Market.—Commercial vegetable crops for the fresh market for the fall season of 1952 were estimated at 1,762,300 tons, 3% larger than in 1951 and 8% above average. The summer crop of 3,227,700 tons was

about average, but 4% less than in 1951. The spring crop of 2,163,200 tons was 2% less than in 1951, but 15% above average, and the winter crop was 1,397,100 tons, smallest of the year and only 93% of the 1951 production, but 3% above average.

Though the price situation varied widely from one type of vegetable to another, in general prices for truck crops were substantially higher than in 1951. The seasonally adjusted July index was 360, compared with 253 a year earlier, and in September it was 269 against 238 a year before. Per capita consumption of fresh vegetables by civilians was expected to average 241 lb., 95% of the 254 lb. of 1951. Exports of fresh vegetables, primarily to Canada, were 548,000,000 lb. in 1951-52, compared with 466,000,000 lb. in the previous year and only 92,000,000 lb. in the pre-World War II period.

Commercial Truck Crops for Processing.—The U.S. 1952 crop of the 11 most important truck crops for commercial processing was forecast, on the basis of incomplete data, at 5,794,000 tons, compared with 6,937,070 tons in 1951 and an average for 1941-50 of 5,090,380 tons.

Consumption of canned vegetables in 1952 was estimated at 41.2 lb. per person, the same as in 1951, but 38% more than in the prewar period. It was indicated that the 1952 pack of canned vegetables was about 20% smaller than the 1951 record of 264,182,000 cases.

The 1952 pack of frozen vegetables was again large, perhaps exceeding the 1951 record pack of 770,038,000 lb., which in turn exceeded the 1950 record of 587,101,000 lb. Stocks in storage on June 30 were 346,031,000 lb., a new record, and about one-third larger than the 1950 record. Green peas constituted about one-third of the total, spinach one-sixth. Consumption per capita was estimated at 4.2 lb. (about one-tenth of that of canned vegetables), 2% more than in 1951.

Dry Edible Peas and Beans.—The U.S. dry edible bean crop of 1952 was indicated at 16,291,000 bags of 100 lb. each, compared with 17,446,000 bags in 1951 and an average for 1941-50

of 17,997,000 bags. California, as usual, was the leading producer (4,651,000 bags), followed by Michigan (3,630,000 bags) and Idaho (2,183,000 bags). Stocks of old-crop dry beans in commercial storage on Sept. 1, 1952, were 4,601,000 bags, compared with 9,785,000 bags in 1950, the latest comparable date.

The U.S. dry edible pea crop of 1952 was less than half a crop, indicated at 2,697,000 bags (100 lb.), compared with 3,763,000 bags in 1951 and an average for 1941-50 of 6,011,000 bags. U.S. civilian consumption in 1952 of 0.7 lb. per capita was the same as in 1951.

World production of dry beans in 1951-52 was estimated at 115,400,000 bags, about 3% more than in 1950-51. Brazil was the leading producer (27,635,000 bags), followed by China (24,000,000 bags) and the U.S.

World production of dry peas was estimated at 16,800,000 bags in 1951-52, 3% less than the previous year. About 4,412,000 bags of peas entered international trade in 1951, compared with 3,757,000 bags in 1950.

World lentil production in 1951-52 of 5,500,000 bags was 5% less than the previous year and 10% below prewar. Egypt and Turkey were major producers. Dry broad bean and horse bean production in 27 countries in 1951-52 was estimated at 28,000,000 bags, with Italy producing about one-third of the total. China was indicated as producing an additional 64,689,000 bags. (See also CORN; HORTICULTURE; POTATOES.) (J. K. R.)

Velasco Ibarra, José María (1893—), Ecuadorian political leader, was born on March 19 at Quito, Ecuador. He was educated at the University of Quito and at the University of Paris, France. He entered government service and served successively as secretary of the national council of state, attorney general of Quito and president of the national chamber of deputies. He was inaugurated as president of Ecuador on Sept. 1, 1934, but was ousted from the office on Aug. 20, 1935, by an army revolt and was exiled to Colombia. He returned to Ecuador for a brief period in Jan. 1940 to lead an abortive coup d'état against the government, then returned to his Colombian exile for another four years. In 1944 he became a candidate for the presidency again, conducting his campaign from southern Colombia as leader of the antiadministration Alianza Democrática. This time successful, he returned to Quito, took over as provisional president after another uprising, and was proclaimed constitutional president on Aug. 10, 1944. A new constitution was adopted under his administration in 1945 but was suspended the following year, and Velasco Ibarra assumed the role of dictator. On Aug. 23, 1947, he was ousted again by a military coup and again exiled—to Argentina.

In 1952 Velasco Ibarra once more announced his candidacy for president, with the support of the semifascist National Revolutionary party. He returned from Argentina in March and was elected president on June 1, 1952.

Venereal Diseases. Syphilis cases reported totalled 168,000 in the United States in the fiscal year 1952. About 12,000 of this total were cases in the early infectious lesion stage of the disease; 38,000 were cases in the early latent stage; 101,000 in the late and late latent stages; 9,000 congenital cases; and 8,000 cases with stage not stated. In each of these stages the 1952 figure was lower than that for 1951, with late and late latent cases showing the smallest decrease. For the first time in several years, 1952 brought a substantial decline in reported cases of congenital syphilis. A decrease of approximately 28% occurred from the number of congenital cases reported in 1951.

Reported cases of gonorrhoea, numbering 245,000 for 1952,

Table II.—U.S. Production of 11 Vegetables for Processing

Crop	(In tons)		
	Preliminary 1952	1951	Average 1941-50
Asparagus	95,300	107,400	91,800
Beans, lima	90,200	95,200	52,100
Beans, snap	241,300	272,000	219,700
Beets	127,700	152,900	140,000
Cabbage	152,400	174,800	179,100
Corn, sweet	1,510,000	1,197,900	1,175,000

Peas, green	425,800	512,500	415,500
Pimientos	12,300	15,300	16,900
Spinach	110,000	144,900	108,700
Tomatoes	3,452,000	4,267,100	2,836,700
Eleven Crop Total	6,549,200	7,215,100	5,447,100

were less than the total reported for the preceding year, but the trend of gonorrhoea morbidity had not been so sharply downward as was the case for syphilis.

There were also 3,800 cases of chancroid and about 1,000 cases each of granuloma inguinale and lymphogranuloma venereum reported during the year.

Mortality from Syphilis.—Total mortality from syphilis was estimated at 4.6 per 100,000 population in the calendar year 1951. This was a decrease of 13% from the 1950 rate. The latest data available in 1952, that for 1949, on infant mortality from syphilis showed a rate of 0.08 per 1,000 live births. This represented a reduction of 90% from the 1933 rate, which was 0.79 per 1,000 live births.

Insanity from Syphilis.—The rate of first admissions to all mental hospitals (exclusive of Veterans administration facilities) for psychoses resulting from syphilis decreased from 6.3 per 100,000 population in the calendar year 1938 to 3.1 in 1949. During the same period the first admissions to state mental institutions with psychoses resulting from syphilis decreased from 10.3 to 5.4 per 100 first admissions for all psychoses.

Health Department Activities.—Of the 2,063,000 persons examined in public venereal disease clinics in 1952, 272,000 were admitted for treatment. Staff members of health departments made 422,000 case-finding investigations to identify and bring to examination persons believed to be in danger of having a venereal disease. As a result of these investigations, 46,000 cases of syphilis and 58,000 cases of gonorrhoea were brought to treatment.

Blood testing surveys revealed that syphilis prevalence was still high among certain population groups in both the urban north and in southern areas.

Many health departments were closing their facilities for treating venereal disease on an inpatient basis in 1952. As a result of research activities in developing new, more effective penicillin preparations and in testing their clinical effectiveness, it had become possible to treat most patients without hospitalization. At the close of the year, only 12 rapid-treatment hospitals and 18 bed-contract facilities for inpatient care remained in operation. Because venereal disease is a serious public health problem, however, public facilities continued to be needed for diagnosing and treating the many thousands of cases still occurring. To meet this need, a new kind of venereal disease control facility was introduced in 1952 to provide essential control services on an outpatient basis. Called venereal disease prevention and control centres, these facilities were developing as regional venereal disease clinics, in which full-time diagnostic, treatment and case-finding services were available. For patients coming from distances too great to make clinic visits from their homes, staffs of the new centres arranged domiciliary care. At the close of the fiscal year 1952, 11 centres were operating in 7 states, and the beginning of 1953 was to see initiation of additional centres.

Among the special case-finding programs sponsored or assisted by the U.S. public health service was a blood testing survey of labourers coming into the United States for temporary employment. Of the 11,868 persons tested, 12.8% gave positive reactions.

Increased emphasis was placed during the year upon the joint civilian-military venereal disease control activities. Trained civilian personnel, made available to establishments of the military service, interviewed nearly 20,000 service personnel to discover their civilian contacts. This operation yielded more than 6,000 new cases of syphilis and gonorrhoea. Selectees and volunteers for military service who were suspected of having syphilis following an induction serologic test were investigated by civilian health workers. About 10,000 persons were being

investigated annually in this phase of the civilian-military program. About 30% were new cases of venereal disease, brought to treatment for the first time. An additional 10% were inadequately treated cases returned to therapy. (See also WORLD HEALTH ORGANIZATION.)

See Federal Security Agency, *Annual Report* (1952).

(T. J. B.)

Venezuela. A federal republic of 20 states, two territories, a federal district and a number of small islands (with less than 1,000 pop. in all) on the north coast of South America, Venezuela has an area of 352,143 sq.mi. Pop. (census of Nov. 1950) 4,986,000, not including indigenous tribes not living in towns; Caracas is the federal capital, pop. 487,000 (662,000 in the metropolitan area). Other cities include Maracaibo, 232,000; Barquisimeto, 105,000; Valencia, 88,000; Maracay, 66,000; San Cristóbal, 56,000; Cumaná, 46,000; Puerto Cabello, 34,000; Ciudad Bolívar, 36,000; Puerto La Cruz, 28,000. The junta of government, as constituted on Nov. 27, 1950, continued to function in 1952 as the federal executive, consisting of Germán Suárez Flámerich, president, and Marcos Pérez Jiménez and Luis Llovera Páez, members, with Pedro Moreno as secretary.

History.—In Aug. 1952 the important trade negotiations between Venezuela and the United States begun in 1950 were concluded. The United States agreed to lower the duty on Venezuelan oil, within the terms of the Trade Agreements act. The quota was removed. The tariff rate was cut to 5½ cents per barrel on heavy oil with a rating of less than 25°, according to the standard set by the American Petroleum institute. Oil of a rating higher than 25° would pay 10½ cents per barrel. Venezuela made a number of rate reductions. Iron ore from Venezuela, actively exported since 1950, likewise remained on the free list of the United States.

Negotiations looking to trade agreements with other nations were expected to take place during 1952–53. Trade missions from Belgium and other countries visited Caracas.

The definition of the Venezuelan-Brazilian frontier proceeded in consequence of the final ascertainment of the headwaters of

OIL DERRICKS on the shores of Lake Maracaibo, Venezuela. Although Venezuela was the largest oil-producing nation in South America in 1952, much of its possible oil lands were still untested

the Orinoco.

The electoral commission fixed the election of a constituent assembly for Nov. 30.

The deepening of the Orinoco main channel as well as the channel into Lake Maracaibo, calculated to assure the interior development of the republic, got under way in 1952. The Central university in Caracas was not reopened in 1952. The universities of the Andes (Mérida) and Zulía (Maracaibo) functioned throughout the school year.

(C. E. Mc.)

Education.—In 1949-50 there were 5,977 public primary schools with 491,799 pupils enrolled. In Jan. 1952 secondary and special schools, public and private, numbered 175 with 32,548 students and 2,407 teachers; the 42 normal schools had 3,005 students and 400 teachers. In 1950-51 the Central university had 4,747 students matriculated, Los Andes 866, Zulía 840 and the Instituto Pedagógico 448. Education was allotted 6.3% of the 1952-53 budget.

Finance.—The monetary unit is the bolívar, valued at \$0.2985 U.S. currency, controlled and free selling rates, during 1952. Actual government expenditure in the fiscal year ending June 30, 1951, was 2,134,447,903 bolívares; revenue, 2,111,643,301 bolívares. The 1952-53 budget was balanced initially at 2,300,000,000 bolívares (1951-52: 1,951,000,000 bolívares). The treasury balance was only 101,652,975 bolívares on Nov. 30, 1951. There was no external debt; the total government and government-guaranteed debt amounted to 144,121,431 bolívares on Dec. 31, 1951, of which 14,737,131 bolívares represented direct government obligations. Currency in circulation (Aug. 31, 1952) was 772,000,000 bolívares; gold reserves \$373,000,000; demand deposits 914,000,000 bolívares; dollar exchange in U.S. banks \$108,000,000. The retail food price index (Caracas) stood at 134 in June 1952 (1948=100).

Trade and Communications.—Exports in 1951 totalled 4,533,660,335 bolívares; imports 2,150,252,223 bolívares. Chief exports were crude petroleum and petroleum products (96%), coffee (1%) and cacao (1%); leading imports, machinery and equipment (29%), foodstuffs and beverages (19%) and metals and manufactures (17%). Commercial imports comprised 73.5% of imports, government imports 8.2%, petroleum company imports 17.2% and mining company imports .3%. Leading suppliers were the U.S. (68%), the United Kingdom (7%), Canada (4%) and Germany (4%); leading customers, the Netherlands Antilles and the U.S.

Railways (1950) totalled 700 mi.; highways, 3,750 mi. of all-weather roads and 1,600 mi. of unimproved dry-weather roads. According to *Lloyd's Register of Shipping* the merchant marine had 97 steamers and motor ships (100 tons and more) aggregating 166,562 gross tons on June 30, 1951.

Agriculture.—Coffee production in the 1951-52 crop year totalled 721,569 bags of 132 lb. each. In 1951, 313,550 bags of coffee and 15,500 short tons of cacao were exported. Sugar production in 1951 was 49,791 tons. The 1950 census (preliminary figures) showed 5,359,654 cattle and 1,292,808 pigs.

Manufactures.—Production in 1951 included cement 685,070 short tons; soap 16,033 tons; cigarettes 2,043,460,000 units; beer 107,396,000 l.; electrical energy 617,727,000 kw.hr.; natural gas 19,113,183,000 cu.m.

Mineral Production.—Production of crude petroleum by the 13 companies in operation in 1951 reached the record figure of 622,194,695 bbl., of which Creole accounted for 45% and Shell 31%. Refinery throughput was 113,800,000 bbl. (1950: 90,099,847 bbl.) and exports of refined products increased to 84,700,000 bbl. (1950: 67,222,878 bbl.). Diamond production in 1951 totalled 63,745 carats; gold production dropped sharply to 2,860 troy ounces. Bethlehem Steel's Venezuelan subsidiary mined 1,241,150 short tons of iron ore during 1951. (J. W. Mw.)

Vermont. A north Atlantic state of the United States of America, the only one of the New England states without a sea coast, Vermont is popularly known as the "Green Mountain state"; it was admitted to the union in 1791. Area: 9,609 sq.mi., of which 331 sq.mi. are water. Population (1950) 377,747 (including 240,135 rural, 137,612 urban; 348,435 native white, 443 Negro, 28,753 foreign born). The U.S. bureau of the census estimated the population of the state to be 373,000 on July 1, 1951. Montpelier is the capital city with a population (1950 census) of 8,599. The chief cities are Burlington (33,155) and Rutland (17,659).

History.—The general assembly did not meet in 1952.

The Vermont Free Public Library commission was one of six areas in the United States chosen by the American Library association in 1951 for an American Heritage project, made possible by a grant of \$150,000 to the American Library association by the Fund for Adult Education. The purpose of the project is the promotion and demonstration of adult community discussion programs through local public libraries on the American heritage and its contemporary application. Vermont was again chosen as one of the areas for the program in 1952.

The Greater Vermont association, replacing the former Ver-

SKIERS around the traditional evening fire at a lodge in Manchester, Vt., where the local population was often doubled on weekends during the skiing season between December and March

mont chamber of commerce, designed to co-ordinate the activities of all the regional development associations in the state and supplement the work of the Vermont Development commission, was organized Dec. 15, 1950. Plans of the association were advanced in 1952 with 1,042 business members and the securing of a full-time manager. As of Oct. 16, 1952, the association had spent \$54,850 for promotion of Vermont.

The chief officers of the state during 1952 were: Lee E. Emerson, governor; Joseph B. Johnson, lieutenant governor; George H. Amidon, state treasurer; Howard E. Armstrong, secretary of state; David V. Anderson, auditor of accounts; Clifton G. Parker, attorney general.

Education.—The 730 elementary schools in the state in 1951-52 had an enrolment of 47,845 and a teaching staff of 1,898. There were 76 public high schools, with an enrolment of 16,553 and a teaching staff of 748. The total current expense for public schools (before audit) was \$12,405,322.05, of which the state paid \$2,741,888.17 (22.1%). The state superintendent of schools was the commissioner of education, A. John Holden.

Social Insurance and Assistance, Public Welfare and Related Programs.—Relief in general was administered by the overseer of the poor in each town. An average number of 6,963 persons a month received old-age assistance from state funds amounting to \$3,279,175 during the year ended June 30, 1952. Aid to dependent children amounting to \$654,648 was distributed to an average number of 3,540 individuals monthly. A total of \$92,219 blind assistance was distributed to about 178 persons a month. Aid to the permanently and totally disabled amounted to \$93,632, paid to about 190 persons a month.

Unemployment compensation payments made under the Vermont law numbered 102,087 and amounted to \$2,064,836 for the year ended June 30, 1952. The three state correctional institutions during the year ended June 30, 1952, had an average of 436 inmates; their total expenses were \$593,290.

Communications.—The total mileage of the public highway system (state, state-aid and town highways) as of June 30, 1952, was 13,677.5 of which 1,822.1 mi. were in the state system and 2,773.5 mi. were in the state-aid system. Total expenditures during the fiscal year ended June 30, 1952, amounted to \$10,128,132.47, of which \$6,841,582.02 was for state highways (including all expenditures for federal aid construction, some of which was located on the state-aid highway system) and \$1,707,614.15 for state-aid highways. There were 942.87 mi. of railways in the state in the year ended Dec. 31, 1951; airports in the state in 1952 numbered 20, seaplane landing areas 2 and airways 2, with a total mileage of 144. Telephone subscribers numbered 80,001 on Dec. 31, 1951.

Banking and Finance.—The number of state and national banks as of June 30, 1952, was 77 of which 38 were state banks with total deposits of \$222,303,314.67 and assets of \$248,186,110.92. The eight co-operative building, savings and loan associations had total assets of \$4,602,288.79. Total receipts of the state as of June 30, 1952, were \$43,282,666.52;

Table I.—Principal Crops of Vermont

Crop	Indicated 1952	1951	Average 1941-50
Corn, all, bu.	2,816,000	2,788,000	2,565,000
Hay, all, tons	1,383,000	1,341,000	1,351,000
Oats, bu.	1,178,000	1,476,000	1,334,000
Potatoes, late, bu.	758,000	738,000	1,405,000
Apples, commercial, bu.	738,000	1,080,000	748,000
Maple syrup, gal.	632,000	733,000	831,000

Table II.—Principal Manufacturing and Processing Industries of Vermont

Industry	Value of products 1950	1949
Machines, machine tools and allied industries	\$60,780,700	\$63,061,400
Woolen, cotton and knit goods	47,606,280	51,571,000
Woodworking, furniture and lumber, etc.	41,070,720	36,906,150
Granite, marble and other stone industries	28,271,610	26,531,000
Paper and paper products	27,963,600	26,435,650
Dairy products	17,115,000	16,500,000

disbursements \$38,697,840.59; unappropriated surplus \$4,870,997.85; obligations outstanding \$4,999,000.00.

Agriculture.—According to the U.S. bureau of agriculture, the major cause of a falling off in production of commercial apples in 1952 was poor pollination resulting from weather conditions unfavourable to bees. Weather conditions were also unfavourable for the production of maple sugar and syrup. A crop of 130,000 turkeys was indicated in comparison with 133,000 in 1951.

Manufacturing.—The Vermont unemployment compensation commission estimated that an average of 38,865 workers were employed in manufacturing industries in the state during the year ended June 30, 1952.

(C. E. Fe.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Vermont in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Vermont ranks 1st among the states in the production of asbestos and 2nd in slate, and stands 39th in value of mineral output, with 0.16% of the U.S. total.

Table III.—Mineral Production of Vermont

Mineral	(In short tons)			
	1950	1949	1950	1949
Line	33,000	29,000	\$416,000	\$356,000

Other minerals.	4,068,000	3,611,000
Total			\$18,563,000	\$17,384,000

Veterans Administration (U.S.). By the end of 1952, veterans and their families made up one-third of the population of the United States. Veterans of all wars numbered more than 19,000,000, of whom 80% served in World War II. More than 1,000,000 had been in uniform since the outbreak of hostilities in Korea in June 1950.

A number of new laws had been enacted providing benefits for the young group of veterans. They included a program of vocational rehabilitation, a new insurance law and a law placing veterans of the Korean conflict on the same basis as other war veterans for purposes of VA medical care and compensation and pensions. Then, in July 1952, came the latest—and probably most far-reaching—of all: a new G.I. bill containing five separate benefits.

Medical and Hospital Benefits.—By Aug. 1, 1952, the VA was operating a network of more than 150 hospitals for the treatment of ill and disabled veterans. It also was utilizing beds in civil, state and other federal hospitals on a contract or agreement basis. At that time, a total of 106,000 veterans were receiving hospital care from the VA. Included were 3,000 with service since the start of hostilities in Korea.

A \$750,000,000 VA hospital construction program was under way and was expected to result in 66 modern new hospitals with a total of 37,000 beds. By Aug. 1, 1952, 44 of these hospitals had been completed.

Korean G.I. Bill.—The new G.I. bill, enacted for veterans who served since the outbreak of hostilities in Korea, includes five benefits, all designed to assist them in their return to civilian life. Included are education and training; guaranteed or insured loans for homes, farms and businesses; unemployment compensation; mustering-out pay; and job-finding help.

Under the educational provisions, a veteran may get one and

one-half days of education or training for each day spent in service since the start of the conflict in Korea. The maximum is 36 months for veterans who had not taken training under the earlier programs for World War II veterans.

While in training, a veteran who served since the start of hostilities in Korea may receive an allowance each month from the government to cover part of his expenses and living costs. All his costs—tuition, fees, books and the like—must come out of the allowance. Rates for veterans in full-time training in school are \$110 a month, if they have no dependents; \$135 if they have one dependent; and \$160 if they have more than one dependent. Rates for on-the-job and on-the-farm trainees are lower. The law's G.I. loan provisions permit veterans who served since the start of the Korean conflict to obtain government-guaranteed or insured loans for homes, farms and businesses on the same basis as veterans of World War II.

Vocational Training for the Disabled.—Vocational rehabilitation is available to veterans of World War II as well as those disabled after fighting started in Korea. Eligible veterans may train in schools, on the job or on the farm. While in training, and for two months afterward, they may receive subsistence allowances from the government in addition to their disability compensation. The government also pays for all training costs, such as tuition and supplies.

By Aug. 1, 1952, nearly 600,000 disabled veterans had taken training, at one time or another, under the program. Nearly half had completed their training and were declared rehabilitated. On that date 34,000 World War II veterans were still in training, along with nearly 900 veterans disabled since fighting started in Korea.

Compensation and Pensions.—Veterans with service-connected disabilities resulting from either wartime or peacetime service may qualify for monthly compensation payments from the VA. Wartime rates, paid also to veterans disabled since the start of fighting in Korea, range from \$15.75 to \$172.50. Additional statutory awards are payable to veterans with certain serious disabilities. Peacetime rates are 80% of the wartime scale.

Pensions may go to veterans of either World War I or II, and to those who served during the period after the start of fighting in Korea, who (1) are permanently and totally disabled for reasons not traceable to service, and (2) whose annual income does not exceed \$1,400 if single or \$2,700 if married or with a minor child. Rates are \$63 a month, increased to \$75 after ten years or when the veteran reaches age 65.

On Aug. 1, 1952, more than 2,400,000 veterans were on VA's pension and compensation rolls. Included were two who had Civil War service and 15,000 who were disabled after the Korean conflict started.

Insurance.—VA administers three systems of insurance: U.S. Government life, for World War I veterans; National Service life, for World War II veterans; and the Indemnity and Insurance acts of 1951, for those with service after the start of the Korean conflict.

Under the 1951 insurance law, those in active service since the Korean fighting began, and certain other groups, are automatically covered, without cost, against death in active service for \$10,000, less any other government insurance they might have had at that time. The free indemnity coverage lasts for 120 days after separation from service for those ordered to active duty for more than 30 days.

Through Aug. 1, 1952, the VA had allowed nearly 9,000 indemnity claims from the families of deceased servicemen. Also at that time, more than 3,000 veterans with service after the start of the Korean conflict were holding the new forms of insurance. The number of National Service life insurance policies in force for World War II veterans was 7,000,000, having a

NUMBER OF PATIENTS remaining in VA and non-VA hospitals on Dec. 31 from 1919 to 1952 by types of disability, as compiled by the Veterans administration

total value of \$49,000,000,000. Also, 449,000 U.S. Government life insurance policies were in force for World War I veterans, totalling nearly \$2,000,000,000.

World War II G.I. Bill.—Of the three major provisions of the original G.I. bill for World War II veterans, one was still in force during 1952; one had passed the cutoff point and the third had expired.

Under the G.I. loan program, which had nearly five more years to run, a total of 3,000,000 World War II veterans had obtained loans valued at \$18,600,000,000 by Aug. 1, 1952. Under the G.I. education and training program—which passed its cutoff point in July 1951—a total of 7,700,000 World War II veterans had taken training. This figure represented more than half of all who served during World War II. The third benefit, readjustment allowances for unemployed and self-employed veterans, ended for most in 1949. Nearly 9,000,000 veterans had received allowances in the amount of \$3,800,000,000.

Other Benefits.—In addition to these, VA administers a number of other benefits for veterans and their dependents. Among them are programs providing cars for the seriously disabled; housing grants for other disabled veterans; and numerous other benefits. (See also BUDGET, NATIONAL; MEDICAL REHABILITATION OF THE DISABLED; TUBERCULOSIS.) (C. R. GY.)

Veterans' Organizations. United States.—In 1952, membership in veterans' organizations generally followed the decline apparent since 1948. The five major organizations had combined memberships total-

ling somewhat less than 4,200,000.

All organizations won at least one issue for which they had worked since the conventions of 1950 when the federal government enacted a G.I. Bill of Rights for Korean war veterans. The new law was largely modelled after the G.I. Bill for World War II veterans. (See VETERANS ADMINISTRATION.)

American Legion.—Membership in the American Legion, largest veterans' organization, fell to 2,700,000 in 1952, a decline of about 100,000 since 1951. At its convention in New York city, Lewis Gough of California was elected national commander to replace Donald Wilson of West Virginia. Both Republican and Democratic candidates for president of the United States addressed the convention which avoided any display of political partisanship. The Legion again stated its opposition to the far eastern policy of the state department and its support of universal military training, and expressed its concern with subversive activity in the United States.

Veterans of Foreign Wars.—The 53rd annual encampment of the V.F.W., held in Los Angeles, gathered only 10,000 members, instead of an anticipated 50,000. The encampment attendance was only one symptom of the problems of the nation's second largest veterans' organization, which had a decline, in 1952, of 97,000 members to reach a low of 1,000,310. The featured speaker of the encampment was Dwight Eisenhower, then a presidential candidate. James Cothran, of South Carolina, succeeded Frank Hilton as commander in chief. The outgoing commander attempted to solve the problems of the group by calling for a long-term national planning committee to guide the V.F.W. internally, to help it plan a worthwhile program for the future.

Disabled American Veterans.—The Disabled American Veterans increased its membership to 170,000 in 1952, an increase of 45,000. Floyd L. Ming of California was elected to succeed National Commander Ewing W. Mays of Arkansas at the 31st national convention held in Boston. The D.A.V. continued to function as a one-purpose organization devoted to the war disabled. Its convention shunned political controversy and concentrated solely on veterans' issues, among them the need for an increase in disability compensations.

American Veterans of World War II (Amvets).—The largest of organizations for veterans of World War II, the Amvets increased its membership in 1952 to 85,000—an increase of 10,000 from 1951 and near its peak of 90,000 in 1948. The national convention, held in Grand Rapids, Mich., elected Marshall Miller of Illinois to replace John Smith of Ohio as national commander. The organization had developed a cash reserve and also furnished funds to support a war orphans scholarship fund, an Arlington Memorial Carillon fund and other public services.

American Veterans' Committee.—The American Veterans' committee, also a World War II group, continued its membership decline to 10,000—its peak year had been 1947 when it had 80,000 members. With only about 35 active, stable chapters, the A.V.C. held its sixth annual convention in Washington, D.C., and elected Curtis Campaigne, Jr., to replace Michael Straight as national chairman. In 1952 he sought to revitalize the A.V.C. by calling for a consistent emphasis on issues of civil rights and civil liberties.

World Veterans Federation.—The World Veterans federation continued its rapid growth in 1952 when five major British groups, representing 700,000 veterans, joined the new international agency dedicated to "the maintenance of peace with freedom." By the close of the year, the World Veterans federation had more than 19,000,000 members from 94 veterans organizations in 16 countries, including France, Italy, Luxembourg, the Netherlands, Belgium, Yugoslavia, Norway, Israel, Denmark, Greece, Turkey, Finland, the Philippines, Canada, Great Britain and the United States. U.S. veterans' organizations participating

were the American Veterans of World War II, Disabled American Veterans, American Veterans' committee and the Blinded Veterans association. (Mo. Pr.)

Canada.—The 14th convention held by the Canadian Legion was marked by a series of resolutions demanding government action on such things as compulsory military training, larger pensions, and more complete rehabilitation and improved hospital treatment for war veterans. The convention delegates, numbering more than 1,100 and representing more than 300,000 members, also backed a call for a royal commission of inquiry into the setup of the three reserve forces, and a demand for better screening of immigrants.

The National Council of Veterans associations, an alliance of five former servicemen's groups, backed the Canadian Legion's demand for higher veterans' allowances. The alliance also pleaded for higher clothing allowances for amputees, and argued that any unemployable war pensioner should be entitled to the war veterans' allowance in addition to his pension.

The Canadian Corps association in its annual meeting suggested a three-point program to step up civil defense, including the adoption and finalization of a joint federal, provincial and municipal policy for "the organization, financing, equipping, training and development of civil defense." The association also decided to ask the federal government to increase the permissible casual earnings of veterans receiving allowances, because the high cost of living was imposing hardships under the existing \$120 annual ceiling. (C. Cv.)

Veterinary Medicine. During 1952 the last two of the new colleges of veterinary medicine in the United States were approved by the council on education of the American Veterinary Medical association and also graduated their first classes. There were then 17 state-supported veterinary schools in the country, 7 of which had been established after World War II. Each of these schools required six years of collegiate training. Including the 2 schools in Canada, 19 schools graduated more than 900 veterinarians in 1952, the largest number for any year since 1918.

Because of the importance to the nation of animal food products, plans were being made for the quick identification, reporting and control of unusual or highly contagious diseases of livestock. Under the leadership of the Federal Civil Defense administration and United States department of agriculture public health officials, federal and state veterinary officials and veterinary associations were co-operating in setting up a nationwide protective organization.

Rabies.—Rabies continued to appear in new territories, spread by dogs and by wild animals such as foxes and skunks. Thousands of cattle died from the disease and hundreds of people were exposed by rabid animals. The disease can be controlled in dogs by systematic vaccinating, but wild animal vectors have to be greatly thinned out either by the disease or by systematic trapping before rabies can be exterminated in an area. New biological agents for controlling rabies included an improved vaccine for animals and a serum which it was thought might provide a protection for a man. The serum acted more quickly and was safer than the Pasteur treatment.

Anthrax.—Most animals including man are susceptible to anthrax but swine are much less so than cattle and sheep. However, late in 1951 and well into 1952 this disease occurred sporadically in swine in many states. The source proved to be spores, a resistant form of the anthrax germ, which were found in imported bone meal used in hog feed. Hundreds of cattle were also affected. Quick treatment with antibiotics and serum and strict quarantine measures prevented the spread of the disease and possible heavy losses.

Foot-and-Mouth Disease.—Both Mexico and Canada succeeded in eradicating foot-and-mouth disease during 1952. This extremely contagious but seldom fatal disease was very prevalent in Europe and South America where attempts were made to control it by vaccination but not by eradication. It therefore was a constant threat to all other areas and required constant vigilance on the part of the inspection and quarantine division of the bureau of animal industry. The six-year eradication campaign in Mexico cost a total of \$85,000,000. The Mexican border was reopened in September for the importation of cattle.

The Canadian outbreak was diagnosed in February near Regina, Sask., about 100 mi. from the North Dakota border. Hundreds of diseased and exposed animals were destroyed and buried and the disease was declared eradicated in August. It had not occurred in the United States since 1929.

Plum Island, off the tip of Long Island, N.Y., was selected as the site for a laboratory for extensive research on foot-and-mouth disease and other virus diseases.

Vesicular Exanthema.—Vesicular exanthema, which affects swine only, suddenly spread from coast to coast in June 1952. It is very contagious but unless secondary infections occur the lesions, which appear on the snout, mouth and feet, usually heal in a few days. It is spread chiefly through feeding uncooked garbage that contains infected pork scraps, or by sick animals. Because the symptoms closely resemble those of the more dangerous foot-and-mouth disease, expensive and time-consuming tests must be made on each new diagnosis. Therefore, the secretary of the department of agriculture on Aug. 1 declared a national emergency so that an eradication program could be put into operation. By November the disease had occurred in 29 states and had been eradicated in 19 of them.

Scrapie of Sheep.—On Oct. 31 the secretary of the United States department of agriculture again declared a national emergency because scrapie, a slow-developing, fatal virus disease of sheep, had been diagnosed in California. Known in Europe for more than 200 years, this was its first appearance in the United States. It had occurred in Canada in 1945, 1951 and also in 1952. The virus affects nerve cells, causing itching, trembling, incoordination and finally death. There is no known treatment.

Leptospirosis.—Leptospirosis had been recognized in dogs and occasionally in men on the North American continent for about 15 years. It had also been diagnosed in cattle, mostly dairy cows and calves, for about eight years. However, in the past year or two it had been recognized in many animals—all types of cattle, horses, swine and sheep—in many states. It is caused by a germ, a member of the spirochete family which may kill quickly but more often causes chronic illness. The disease symptoms vary considerably with the species from abortion to inflammation of the eyes. Recovered animals may remain spreaders by eliminating *Leptospira* in their urine for long periods. Treatment of the disease was not very satisfactory except in dogs but research on the development of a vaccine was progressing.

Hog Cholera.—The greatly increased swine industry of the past 40 years was made possible by the successful development of serum and virus vaccination against cholera. This disease, which affects only hogs, is very contagious and about 97% fatal. In spite of the marked efficiency of the vaccination method, the living virus when carelessly used often initiated the very disease it was attempting to control. After many years of research vaccines which were fairly effective, yet which could not produce cholera, were developed.

The chief sources of hog cholera are: sick hogs, vaccination virus and virus in refrigerated pork from hogs in the early, undetected stages of the disease. Scraps of such pork are often contained in garbage. To eradicate vesicular exanthema an at-

CANADIAN RANCHER, on the ranges near Calgary, Alta., roping a calf which he wanted to inoculate

tempt was being made to have all garbage cooked before it was fed to hogs. If this were done, it would also eliminate one source of hog cholera. With nonvirulent cholera vaccines available to replace virulent virus, and with virus-containing garbage eliminated, it was hoped that the eventual eradication of hog cholera would be possible.

Chronic Poisoning of Cattle.—Progress was made, during 1952, in establishing the exact cause of two poison diseases of cattle.

(1) Hyperkeratosis (X disease), a chronic disease of cattle, was known to be caused by highly chlorinated naphthalenes, hydrocarbons which are often added to lubricating oils so they will stand more pressure. Taken by mouth or absorbed through the skin, the toxin, unless halted early, is fatal. Calves nursing a poisoned cow may be affected. Many cattle were poisoned in 1952 by feeds which somehow became contaminated with this chemical.

(2) Trichloroethylene extracted soybean meal was finally proven to be the cause of a fatal slow-developing aplastic anaemia in cattle. The exact poisonous agent had not been determined. Not more than 1% of all soybean meal was made by this method and it had been discontinued. Hundreds of cattle had died from this poison since 1948, and horses and sheep had also been experimentally poisoned.

A plant poisoning in cattle, induced by eating bracken ferns which grow in various parts of the country, causes a similar slow-developing fatal anaemia. Here again the exact poisonous agent had not been determined. A similar poisoning had been caused in human patients by the antibiotic chloramphenicol.

American Veterinary Medical Association.—The American Veterinary Medical association held its 89th annual meeting at Atlantic City, N.J., June 22 to 26, 1952. The registered attendance was 2,613. (W. A. A.)

Vietnam: see INDOCHINA.

Virginia. One of the 13 original states of the United States, Virginia was admitted to the union June 26, 1788; it is known as the "Old Dominion" and as the "Mother of Presidents." Southernmost among the middle Atlantic states, Virginia has an area of 40,815 sq.mi., including 922 sq.mi. of water. Pop. (1950) 3,318,680, compared with 2,677,773 in 1940. Principal urban areas include the capital, Richmond (230,310 in

1950), Norfolk (213,513), Arlington county (135,449), Roanoke (91,921) and Portsmouth (80,039).

History.—The general assembly convened for its regular biennial session in Jan. 1952. A record 1,273 bills were introduced, of which 715 were enacted into law. The assembly appropriated an additional \$30,000,000 in state funds for local school construction, bringing to \$75,000,000 the amount thus made available for a four-year period. A surplus in the unemployment compensation fund permitted an increase in compensation benefits, with an accompanying reduction in the tax rate. Laws governing highway safety were amended to provide more severe penalties, including mandatory jail sentences, under certain circumstances, on reckless drivers. Local welfare rolls were ordered to be opened to public inspection. State employees were brought under the federal social security system. Other laws were passed to check the Ku Klux Klan, to punish the bribery of athletes, to compel disclosure by state institutions of expenditures for their athletic programs, and to let women serve on grand juries. A greatly expanded program of state promotion was approved for the port of Hampton Roads. The assembly failed, however, to comply with a mandate of the state constitution requiring a redistricting of the 140 seats in the assembly, and an extra session of the assembly was summoned to fulfill this requirement in December. John Stewart Battle served as governor throughout the year. Lieut. Gov. L. Preston Collins died in September, and was succeeded in office by A. E. S. Stephens. J. Lindsay Almond, Jr., was attorney general.

Education.—In 1951-52 elementary school enrolment was 482,001, with a teaching staff of 13,374; secondary school enrolment was 156,766, with a teaching staff of 5,940. The teaching staff also included 1,323 instructors in vocational education and 2,363 principals, head teachers and supervisors. D. J. Howard was state superintendent of public instruction.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ended June 30, 1952, 7,992 persons received \$858,469 in general relief; 22,709 received \$5,204,945 in old-age assistance; 11,390 families with 32,200 dependent children \$4,864,170; 6,160 under the foster care program \$1,082,972; 3,990 totally and permanently disabled \$1,084,572; and 1,716 blind \$552,346. From January through September 1952, 307,325 checks representing 354,197 weekly payments were written for civilian unemployment compensation, amounting to \$6,020,902. This was more than was paid out in all of 1951, but the increase was accounted for largely by an increase in the benefit rate. Between Jan. 1 and July 18, when the program was closed, 101 checks representing 173 payments for war veterans' readjustment allowances were written for \$3,410.

The average daily population of 6 penal institutions for adults was 5,575, and of 4 industrial schools for juveniles was 617, at the end of the fiscal year in June 1952.

Communications.—On July 31, 1952, there were 8,882 mi. of highway in the state's primary system, and 39,650 mi. in the secondary system. During the year ended June 30, 1952, the state spent \$74,867,828 on its highways, 14% more than the previous year's expenditures. The total railroad mileage was 4,126.37 on Jan. 1, 1952. There were 778,342 telephones in Virginia on Aug. 31, 1952.

Banking and Finance.—On June 30, 1952, Virginia had 183 state banks

Table I.—Principal Crops of Virginia

Table II.—Principal Industries of Virginia

Industry	1951	1950
Tobacco manufactures	\$1,015,895,000	\$858,172,000
Chemical and allied products	898,683,000	568,139,000
Textile mill products	466,599,000	445,716,000
Food and kindred products	467,979,000	422,456,000
Paper and allied products	198,948,000	148,218,000
Transportation equipment	198,883,000	207,485,000
Lumber and wood products	228,445,000	207,951,000
Furniture and fixtures	136,640,000	129,993,000
Wearing apparel	118,314,000	110,481,000
Fabricated metals	80,226,000	71,592,000
Stone, clay and glass products	67,362,000	54,192,000
Printing and publishing	61,804,000	55,133,000

with 71 branches and 133 national banks with 10 branches. On June 30, 1952, deposits in national banks were \$1,252,437,000 and assets \$1,359,820,000. On June 30, 1952, deposits in state banks totalled \$908,289,428 and assets \$993,909,048. Resources on Dec. 31, 1951, of 16 industrial loan associations were \$14,004,753; of 49 building and loan associations \$67,999,047; of 32 credit unions \$2,752,182.

For the fiscal year ended June 30, 1952, the state treasurer received revenues of \$359,010,010, about 5.9% more than in the previous year; expenditures were \$362,033,045. The gross debt on June 30 was \$12,009,431; a sinking fund of \$8,336,271 left a net debt of \$3,673,159. The fiscal year ended with a cash general fund surplus of \$55,705,899, plus an invested surplus of \$10,754,800.

Agriculture.—For the second consecutive year, Virginia crops suffered from a severe drought in July and August; the damage was especially severe to the corn crop, which dropped to its lowest point in eight years. Peanuts also were affected seriously, and potato production fell to an abnormally low point. Late rains, however, permitted other crops to make an amazing recovery, with the result that tobacco production surpassed all records. It also was a record year for cattle on Virginia farms; beef animals were estimated at 1,269,000 head. The state's turkey crop increased 60% over the preceding year, to put Virginia in second place in the nation for turkey production, surpassed only by California. The total value of crops, including cash sales, produce consumed on farms, and government payments, was expected to surpass the record \$601,000,000 of 1951.

Manufacturing.—The value of products manufactured in Virginia was estimated by the state department of labour and industry, on the basis of reports from 2,100 plants, at \$4,103,478,000 in the year ended Dec. 31, 1951, compared with \$3,426,847,000 in the preceding year. The number of persons engaged in manufacturing activities for the year 1951 was placed at 242,200; they were paid \$694,221,000, of which \$548,045,000 went to 208,900 production workers and \$146,176,000 to the 31,300 salaried and supervisory employees.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Virginia in 1949 and 1950, whose value exceeded \$100,000. Data for 1951 were not yet available. Virginia ranked 2nd among the states in the production of pyrite, and stood 21st in the value of mineral production, with 1.16% of the U.S. total.

Table III.—Mineral Production of Virginia

Mineral	(In short tons)			
	1950	Value	1949	Value
Clays	546,000	\$ 520,000	449,000	\$ 404,000
Coal	17,667,000	96,965,000	15,584,000	82,367,000
Coke*	198,000	2,931,000	158,000	2,300,000
Feldspar	30,000	188,000	38,000	234,000
Lead	3,000	878,000	3,000	1,047,000
Lime	428,000	3,862,000	349,000	3,214,000
Sand and gravel	4,374,000	4,145,000	4,413,000	4,049,000
Stone	9,273,000	16,435,000	7,510,000	12,443,000
Zinc	12,000	3,520,000	13,000	3,265,000
Other minerals		11,293,000		9,385,000
Total		\$137,806,000		\$116,408,000

*Values for processed materials are not included in the totals.

Virgin Islands. The Virgin Islands have the status of an organized but unincorporated territory of the United States, located 1,400 mi. S.E. of New York city and 40 mi. E. of Puerto Rico. The three largest islands, with a total area of 133 sq.mi., are St. Croix (pop. 12,103, census of 1950), St. Thomas (13,813) and St. John (749). The chief cities are Charlotte Amalie, the capital (11,469), on St. Thomas and Christiansted (4,112) and Frederiksted (1,961) on St. Croix.

Morris F. de Castro was inaugurated as governor on March 24,

1950. He was the first Virgin Islander to hold the position.

History.—The Knud-Hansen Memorial hospital (116 beds) at Charlotte Amalie and the Charles Harwood Memorial hospital (60 beds) at Christiansted were under construction during 1952, along with a 12-bed clinic and public health facility at Frederiksted and a 4-bed public health facility at Cruz Bay, St. John. United States Assistant Secretary of the Interior Robert Rose participated in the cornerstone ceremonies at Charlotte Amalie and Christiansted. It was expected that these modern hospitals and health facilities would be completed early in 1953. A low-cost housing project was under way in St. Thomas to provide 240 housing units, financed by the Public Housing administration of the federal government. A similar project was also under way in Christiansted.

Installation of the modern telephone communication facilities had been almost completed and they were soon to be placed in operation.

Education.—Enrolment in the public schools of the Virgin Islands during 1952 totalled 5,423 as compared with 4,944 in 1951. Of this number, 2,219 students were enrolled in the elementary schools and 993 in high school in St. Thomas, while in St. Croix 1,443 were enrolled in the elementary schools and 467 in high school. Expenditures for public education in the Virgin Islands totalled \$544,447.41, of which \$71,370.63 was made available by the federal government. The average annual cost of education per pupil in the public schools was \$90.33. This included the daily school lunch service. The average annual salary per teacher in St. Thomas was \$1,584; in St. Croix \$1,480.

Finance.—Budgeted expenditures of the municipality of St. Thomas and St. John during the fiscal year 1952 amounted to \$1,388,658.99. A total of \$1,094,401.24 was raised through local taxation, and \$279,200 was allocated from the federal deficit appropriation. The budget deficit of about \$15,000 was absorbed by departmental savings.

In the municipality of St. Croix, a total of \$505,798.62 was raised from local taxes. The allocation of \$465,800 from the federal deficit appropriation enabled the municipality to meet its total budgeted expenditures of \$969,488.

Trade.—During the fiscal year 1952 a total of 338 commercial ships with a gross tonnage of 1,920,735 entered the port of St. Thomas as compared with 332 ships and a gross tonnage of 1,419,825 in 1951. Nearly 1,000,000 lb. of cargo were transported by air in and out of St. Thomas during the fiscal year.

Agriculture and Industry.—About 11,646 tons of sugar were produced, compared with 7,400 tons in 1951.

Vitamins and Nutrition. After vitamin B₁₂, the anti-pernicious anaemia and growth vitamin, was isolated in 1948, a number of forms of the vitamin were described. Two antipernicious anaemia pigments, described separately as vitamin B_{12a} and vitamin B_{12b}, were later shown to be identical and to differ from vitamin B₁₂ by a slight chemical change. There had been indications that one or more other vitamin B₁₂-like factors might be required for the growth of chicks. Comparing the action of certain preparations with vitamin B₁₂, it was found that unidentified factors affected the growth of chicks relatively more than they did that of micro-organisms and it was postulated that they represented new "animal protein factors." In 1952, a report from the University of Wisconsin, Madison, by U. J. Lewis, D. V. Tappan and C. A. Elvehjem brought conclusive evidence of the existence in the faecal matter of rats of a vitamin B₁₂-like material which not only differs from vitamin B₁₂ in its chemical characteristics but also presents different biologic properties. It was believed that the discovery of a new vitamin B₁₂ with different biologic properties from those of the classic forms might constitute an important step in the advance of existing knowledge of blood-forming processes and of the aetiology of various forms of anaemias.

That the relation between the B-vitamin pantothenic acid and structural or functional integrity of the cortex of the adrenal gland is a close one had been often suggested. A study by L. S. Hurley and A. F. Morgan was based on the reasoning that if it is true, as suggested from the histologic and physiologic evidence at hand, that pantothenic acid deficiency imposes a continuous stress on the adrenal cortex, then exhaustion of the adrenals should occur, and the deficient animals should act as though the adrenals had been removed if exposed to a second stress. Decreasing the oxygen tension to that prevailing at 20,000 ft. of altitude was used as the stress. The responses of normal and of pantothenic acid-deficient animals were compared with respect to liver glycogen and blood glucose, adrenal ascorbic acid concentration and adrenal weights.

While the normal rats increased their liver glycogen by 600% to 700%, under reduced tension, the pantothenic acid-deficient rats showed no rise in liver glycogen during the stress period. The deficient animals also showed lower ascorbic acid values and greater adrenal weights than the controls. Administration of one dose of pantothenic acid did not produce a very marked rise of glycogen or blood glucose. By contrast, administration of adrenal cortical extract enabled the deficient rats to raise their liver glycogen and blood sugar under anoxia as well as the control group.

The authors concluded from these results that it is probably a functional deficiency of adrenal cortical hormones which produces the failure of carbohydrate metabolism under stress. The fact that their administration could instantly restore this mechanism while the effect of pantothenic acid was delayed pointed specifically to the adrenal cortex as the site of the defect. This study again contributed a suggestion that there is a close link between pantothenic acid and adrenal function, but a clear-cut answer to the problem was still needed.

One of the most widespread nutritional disorders in tropical and subtropical areas is a syndrome which was in 1952 still ill defined. It was known by various names such as kwashiorkor, malignant malnutrition, polydeficiency disease and infantile pellagra. As the result of a recommendation made by the joint Food and Agriculture organization-World Health organization Expert Committee on Nutrition in Oct. 1949, J. F. Brock and M. Autret visited a large number of territories in Africa and in 1952 presented a report of their observations and a critical analysis of the available literature.

In this report kwashiorkor was defined as a nutritional syndrome (or syndromes) found among indigenous Africans and composed of five essential features: retarded growth in the late breast-feeding, weaning and postweaning ages; alterations in skin and hair pigmentation; edoema; fatty infiltration, cellular necrosis or fibrosis of the liver; and a heavy mortality when not treated. A variety of dermatoses, gastrointestinal disorders, mental apathy and anaemia are commonly associated with but not essential components of this syndrome. While the report of Brock and Autret was restricted to kwashiorkor in the pre-weaning and postweaning child in certain areas in Africa, they recognized that a similar syndrome occurs in other parts of the world and is often given the same name.

The authors made several recommendations for the prevention of kwashiorkor. Since the provision of adequate supplies of animal proteins in these areas would require many years, their attention was focused largely upon improving the quality of the protein of vegetable origin in the diet. Cassava and similar foods give high yields of calories per acre. Peanuts, soybeans and protein-rich varieties of millet are among the plants giving good yields of protein. The improvement of indigenous pulses and other foods familiar to these people was recommended instead of the introduction of new foods which might not be accepted.

Besides these general measures for dietary improvement, more suitable supplementary foods for weanling infants were badly needed to replace the starchy gruels. Artificial "milk" from pulses or peanuts, which can be made at home, was suggested. By means of education and aroused interest, some progress was being made.

The relation between dietary cholesterol, plasma cholesterol and the occurrence of atherosclerosis (a type of hardening of the arteries) in man had been subject to wide interest and extensive discussion. One of the chief difficulties in studies of this kind in man was the lack of a satisfactory measure of the degree of atherosclerosis in an individual, resulting in the virtual impossibility of determining whether a therapeutic regimen has made a change in the degree of atherosclerosis. Since it is believed that most if not all patients with coronary occlusion and myocardial infarction have coronary atherosclerosis, a group of patients who have suffered this cardiac insult should serve as controls for a similar group for whom a specific therapeutic regimen is designed. Such a study was undertaken by L. M. Morrison. One hundred patients with coronary atherosclerosis as determined by previous coronary occlusion and myocardial infarction (established by clinical findings and typical electrocardiographic changes within six months of the study) were observed over a period of three years with regard to recurrent coronary thrombosis, congestive heart failure, mortality rate, serum lipid determinations and body weight. The patients were divided into two groups of 50 each, the division being made by "comparable" alternation. One group of 42 males and 8 females, averaging 60 years of age, served as controls by being allowed to eat ad libitum an "average American diet" which was estimated as containing between 80 and 160 g. of fat, and 200 to 1,800 mg. of cholesterol per day. The treated series comprised 43 males and 7 females whose ages averaged 62 years. This group was given the experimental diet designed to be low in fat and cholesterol. This diet contained 25 g. fat and 50 to 75 mg. cholesterol daily. The maximal caloric allowance was 1,500 calories daily and furnished 320 g. of carbohydrate and 90 g. of protein.

The results in this small group of patients suggested a beneficial effect upon morbidity and mortality in the group given the low-fat, low-cholesterol diet. Of the 50 patients allowed to consume the "average American diet," 35 were alive at the end of three years (mortality rate, 30%), whereas, of the 50 patients fed the low-fat, low-cholesterol diet, 43 were alive at the end of four years (a mortality rate of only 14%). (See also NUTRITION, EXPERIMENTAL.)

Vocational Rehabilitation, Office of. This office, a constituent unit of the Federal Security agency, administers grants-in-aid and supplies leadership and technical assistance for the state-federal vocational rehabilitation program, a public service to prepare handicapped civilians for or to keep them in jobs commensurate with their fullest capabilities.

Various combinations of the following services are provided, according to the disability and need of each individual. Those numbered 1, 2, 5, 8 and 9 are furnished without charge and the others are paid for from public funds to the extent of the individual's inability to pay: (1) medical examination to determine eligibility and extent of disability, to discover hidden disabilities

and to ascertain work capacity; (2) individual counsel and guidance, including interest and aptitude tests, to help the disabled person choose and attain a job objective within his physical limitations but commensurate with his best potential abilities; (3) medical, surgical and psychiatric treatment and hospital care to reduce or remove the disability; (4) prosthetic appliances such as limbs, braces and hearing aids to improve work ability; (5) training in school, on the job or by tutor to fit the individual for the right job; (6) maintenance and transportation during physical restoration and training; (7) occupational tools, equipment and licences to give the handicapped person a fair start; (8) placement on the right job; and (9) a follow-up to make sure the rehabilitant and employer are mutually satisfied or to effect necessary adjustment.

Any person of or near working age who has a physical or mental disablement which constitutes a substantial vocational handicap is eligible. Through 1952, nearly 676,000 persons had been rehabilitated since the first vocational rehabilitation act was adopted in 1920.

During the fiscal year ending June 30, 1952, 63,632 persons were rehabilitated into self-supporting jobs and another 13,813 persons had been placed in jobs and were awaiting a post-rehabilitation check at the year's end. In addition, 12,242 persons were ready for jobs on June 30 and the active rolls listed 111,396 persons in earlier stages of rehabilitation.

Orthopaedic disabilities were the most common, being the primary handicap of 42% of the rehabilitants. Twelve per cent were amputees and 30% suffered from impairments of the extremities or bones. Visual disabilities accounted for 12%; aural, 9%; tuberculous, 9%; mental, 7%; cardiac, 4%; and all other defects, including ulcers, hernia, speech and asthma, 17%.

The annual rate of earnings of the rehabilitants when services were started was estimated at \$16,000,000, mostly in temporary, unsafe or otherwise unsuitable jobs. The annual rate of earnings for the first year after rehabilitation was estimated at \$100,000,000, on which federal income taxes were estimated at \$8,500,000. Within four years, the 1952 rehabilitants would pay in federal income taxes as much as the entire 1952 federal expenditure for the rehabilitation program, which was \$21,500,000. State expenditures totalled \$10,500,000.

The number of men and women throughout the country who were disabled to the extent of needing rehabilitation services was estimated at between 1,500,000 and 2,000,000 in 1952. Every year as a result of chronic illness, accidents and congenital defects about 250,000 men and women become disabled to the extent that they need rehabilitation services in order to become employable. (See also MEDICAL REHABILITATION OF THE DISABLED; VETERANS ADMINISTRATION [U.S.].) (M. E. SR.)

Wages and Hours. U.S. manufacturing pay rolls in Aug. 1952 were 1.6% above the 1951 dollar level, compared with a 14% gain for the preceding year. Manufacturing employment declined .7% during the year.

Total wage and salary payments for Aug. 1952 were \$15,083,300,000, which represented an increase of 5.7% over the same month in 1951.

Real wages reached a new post-World War II peak in March 1952 of 149.4 (based on 1939 averages). The previous high was 148.8 in Dec. 1950. Average real wages for the first eight months of 1952 were .9% above the 1951 figures (see Table I).

In 23 industries, average weekly earnings increased more rapidly than the 3.05% rise in the consumers' price index. In eight industries (four of which were adversely affected by work stoppages in steel) weekly wages did not keep pace with the cost of living. Increases in hourly wage rates follow almost exactly the same pattern as weekly averages when compared with the con-

sumers' price index variations.

The highest weekly earnings for any industry were \$88.31 in building construction. This was 3.3% above the highest 1951 figure. The greatest comparative increase in average weekly earnings was one of 14.3% in the leather industry. Decreases in take-home pay were experienced in coal mining, steel, and automobile manufacturing. These decreases did not reflect a continuing trend, but were the result of disruptions in production by reason of labour disputes principally in the steel industry. Aside from these isolated decreases, the smallest gain in average weekly earnings was one of 1.8% in general merchandising. Reported payments in this instance, however, do not include commissions.

Irregularities in coal production were reflected in the 26.4-hr. work week for anthracite miners, and the 27.6-hr. week for bituminous miners. In the various industries shown in Table II, the number of hours worked per week declined in 14 instances, increased in 15 and remained steady in 3.

In Aug. 1952, 82.4% of the industries shown in Table II paid average weekly earnings in excess of \$60, compared with 71% in 1951. About 44% paid \$70 or more, and 8.8% paid more than \$80 a week.

The highest average hourly earnings were in building construction (\$2.282), followed by \$2.256 in bituminous coal mining. The greatest proportionate gain in hourly rates was one of

*July figure.

8.3% in rubber manufacturing, with the next greatest gain (7.8%) in metalliferous mining. Slight declines in coal mining and in apparel manufacturing were caused by temporary maladjustments in the classifications of labour employed during August. The lowest monetary rate paid was 87.4 cents in hotels (not including tips, board, room and uniforms). For manufacturing as a whole, the increase in hourly rates was 4.2%, compared with 9.0% in 1951 and 4.6% in 1950.

Table III shows a five-year climb of 34.5% in hourly earnings rates for all manufacturing industries. The greatest five-year improvement was in lumber (48.7%). The gains for the year were spread among all industries, apparently demonstrating that the soft goods industries had substantially caught up with the strong wartime wage gains in the durable goods industries.

In Aug. 1952 the average hourly rate for common labour was \$1.793, compared with \$1.637 in 1951 and 47 cents in 1941. Farm wages increased from 73 cents per hour (not including room and board) in 1951 to 87 cents in 1952, an increase of 19.2%.

Wage payments (both hourly and weekly) did not increase as rapidly during the year as they had during the postwar period up through 1951. How much of the slowdown in the rate of increase was attributable to reduced inflationary pressures and how much to the effectiveness of Wage Stabilization board policy was problematical. Soft spots which had appeared in 1951 did not continue to be evident in 1952. The general trend throughout the first eight months of 1952 in hourly and weekly earnings and in real wages continued to be upward. (D. J. H.)

Other Countries.—The inflation that followed the outbreak of the Korean war appeared to have reached its peak in most European countries before the beginning of 1952 and the cost of living steadied, with consequent slackening of wage demands. In such countries as the United Kingdom and Australia price raises, probably delayed by the stricter economic controls, continued during 1952 and many wage demands were pressed.

Edgar Faure, the French prime minister, failed early in the year to get assembly approval for a bill to base the minimum

wage on the monthly cost-of-living figures. He gave way to Antoine Pinay who got the bill through. Pinay's efforts to keep prices steady were substantially successful: from a peak index of 148.5 in the winter of 1951-52, they fell to 142.1 at the end of June and rose to 144.8 in August.

Italian civil servants received an increase of 2,000 lire a month in January after a bill to grant them 1,500 lire was amended against the wishes of the government. Although there was some unrest over wages the labour year was relatively quiet. In the German Federal Republic, which had an abundant supply of refugee labour, a demand was raised, but not acceded to, for a reduction in working hours from 48 a week to 40 to prevent unemployment. Legislation in January provided machinery for fixing minimum wages in industries where nonexistence of unions or employers' organizations prevented collective agreement.

The system of fixing minimum wages in Australia based on quarterly cost-of-living figures was attacked in June by employers' organizations. They asked the Court of Conciliation and Arbitration to cancel the June award of an average of 9s. a week, to increase hours from 40 to 44 and to abandon automatic wage increases with every rise in cost-of-living figures. The court refused to cancel the award and the other matters were outstanding late in the year.

In the United Kingdom, the spate of wage claims which had characterized 1951 continued and on May 15 R. A. Butler, chancellor of the exchequer, appealed for wage restraint, pointing out that claims outstanding affected between 7,000,000 and 8,000,000 workers. In July Sir Walter Monckton, minister of labour, referred back wage increase awards submitted by 12 councils in the distributive trades and asked for their reconsideration in the light of the chancellor's appeal. When a number of these awards were resubmitted without alteration he accepted them, thus giving wage increases in some shops of from 2s. to 10s. a week. Engineers (who at first asked for an increase of £2 a week), coal miners and dockers were among those with claims outstanding late in the year.

Increases granted in Jan.-Aug. 1952 affected 6,101,000 workers who got £2,338,900 more a week. Among them were agricultural workers who got, in the case of men over 21, an increase of 5s. a week, making their weekly minimum 113s. Many more industries granted 12 days' paid holidays in 1952 in place of 6. There were no important changes in working hours. While average earnings for men in April 1952 were 173% above 1938, average wage rates for a full ordinary working week had increased by only 108%. The disparity is accounted for by the lower number of hours a week worked as basic in 1952, the greater number of hours worked at overtime rates and by extension of payment by results. (See also AGRICULTURE; BUILDING AND CONSTRUCTION INDUSTRY; BUSINESS REVIEW; CENSUS DATA, U.S.; LABOUR UNIONS; PRICES.)

(R. JAN.)

Wage Stabilization Board. The U.S. Wage Stabilization board (WSB) was created under executive order 10161, Sept. 9, 1950. The board was organized within the Economic Stabilization agency (ESA) and activated in November with Cyrus S. Ching as chairman. Membership included three representatives each of labour, industry and the public. Instructions were to advise and make recommendations to the ESA.

Labour members wanted a larger board with greater power. On Feb 15, 1951, the Congress of Industrial Organizations and American Federation of Labor members of WSB bolted, thereby rendering the WSB inoperative until it was reconstituted under executive order 10233, April 21. The WSB was reorganized by the new chairman, George W. Taylor, and reactivated on May 8. During the interim, ESA had promulgated and administered a

policy limiting wage increases to 10% of the Jan. 15, 1950, pay levels, but providing for additional adjustments in specific instances wherein this arbitrary base date was "abnormal."

The second WSB had 18 members—6 each to represent labour, industry and the public. Fourteen regional offices implemented board policy. The reconstituted board had somewhat broader powers over labour disputes, with jurisdiction enforceable only after collective bargaining, mediation and conciliation had failed, provided the parties agreed to submit the dispute to the WSB or provided the president referred to the board disputes affecting defense mobilization. The "tandem" regulation set down by ESA was clarified to permit continuation of historical relationships whereby adjustments of wages for one group of employees had been directly related to those of another group in timing, amount and nature, without regard to the overall 10% limitation.

A second labour walkout from the WSB was threatened because wage controls allegedly were being maintained more rigidly than price controls. On Aug. 29, 1951, Chairman Taylor resigned and was replaced by Nathan P. Feinsinger.

WSB continued to deal with all elements of compensation, including such fringe benefits as paid vacations, holidays, shift bonuses, incentive payments, employer contributions to insurance, welfare and pension funds and premium overtime payments. Increasing emphasis was placed upon cost-of-living escalator adjustments in wage rates, and less upon the 10% formula.

The steel case continued to be a serious problem, with the union shop recommendation of the WSB and the price increase for steel recommended by ESA receiving criticism respectively from management and labour. Another example of increasing tension was a strike in the oil industry during April and May 1952, when industry representatives refused to appear at WSB panel hearings and the union subsequently refused to return to work without a contract, despite WSB action. Notwithstanding these difficulties, Chairman Feinsinger reported in Aug. 1952 that more than 90% of WSB rulings in 60,000 wage petitions were unanimous and that WSB had modified or denied about 20% of the wage-increase requests.

A backlog of about 12,000 cases created impatience on the part of unions over delays in disposing of cases. Another labour bolt from the board appeared to be imminent. Under the continuing pressure of both labour and management groups, the WSB was revamped again, with its authority restricted and budget reduced. Archibald Cox replaced Feinsinger as chairman on Sept. 1, 1952.

In Oct. 1952, labour members of the board dissented from the WSB decision to trim 40 cents from the \$1.90-per-day increase agreed to by the United Mine Workers and the bituminous coal operators, and the U.M.W. struck in protest of the board recommendation. The action high-lighted the board policy that "the important question under wage stabilization is not what the parties may agree upon but what the Board will approve."

(D. J. H.)

Waksman, Selmán Abraham (1888—), U.S. biologist and Nobel prize winner, was born at Priluka, Kiev province, Russia, on July 2; he emigrated to the United States in 1910 and became a naturalized U.S. citizen six years later. He received his B.S. (1915) and his M.S. (1916) from Rutgers university, New Brunswick, N.J.; and his Ph.D. from the University of California in 1918. After working as a research biochemist for private laboratories in California, he returned to Rutgers to teach soil microbiology; he became associate professor there in 1924 and full professor in 1930. As early as 1915 he had begun his investigations which ultimately led to discovery of the drug streptomycin; not until

1939, however, did he change the course of his research with earth moulds in such a way that it led to production of the new antibiotic. Streptomycin was introduced by Waksman and his associates (including Albert Schatz of Brooklyn college) in 1943. The medical profession found it especially effective against tuberculosis, whooping cough and a number of other diseases.

For his codiscovery of streptomycin, Waksman was awarded the 1952 Nobel prize for medicine and physiology, announced Oct. 23, 1952, at Stockholm, Sweden.

Washington. A state in the extreme northwestern United States, popularly known as the "Evergreen state," Washington was admitted to the union Nov. 11, 1889. Total area: 68,192 sq.mi., of which 66,786 sq.mi. are land; pop. (1950): 2,378,963; native white 2,125,495; foreign-born white 191,001. According to a July 1, 1952, estimate, the state's population was 2,496,050. In 1950, the urban population was 1,503,166 or 63.2% of the total population. The population of the three largest cities, according to July 1, 1952, estimates (1950 figures in parentheses), were respectively: Seattle, 477,930 (467,591); Spokane, 171,040 (161,721); and Tacoma, 145,170 (143,673).

History.—On Sept. 2, 1952, the supreme court of the state declared unconstitutional the law of 1937 which penalized the possession or operation of slot machines, which had been assumed to exempt nonprofit clubs. In a 7 to 2 decision, the court held that slot machines were in violation of article ii chapter 24 of the state constitution which forbids the state legislature to authorize any lottery.

In Aug. 1952, the federal Securities and Exchange commission approved the distribution of Washington Water Power stock formerly held by the American Power and Light company. Nine temporary directors of the local company were elected.

The first annual far east trade fair was held in Seattle between Sept. 6 and 14. About \$500,000 worth of goods, representing 10,000 articles from 500 oriental manufacturers, were on display.

The chief state officers for 1952 were: governor, Arthur B. Langlie; lieutenant governor, Victor A. Meyers; secretary of state, Earl S. Coe; treasurer, Tom Martin; auditor, Cliff Yelle; attorney general, Smith Troy; state superintendent of public instruction, Pearl Wanamaker (elected on nonpartisan basis); state commissioner of public lands, Jack Taylor; state insurance commissioner, William A. Sullivan; chief justice of the state supreme court, E. W. Schwellenbach.

Education.—During the year 1951-52, the enrolment in the public schools was 426,580, and average daily attendance for elementary schools was 237,107, for junior high schools 45,739, and for senior high schools 73,463. The total number of teachers was 17,191 and the average salary for all certified personnel was \$3,866.14. The total current expenditures were \$103,831,089.02 and the cost per pupil in attendance was \$256.41. The combined enrolment for the fall term of 1951 at the University of Washington, the State College of Washington and the three colleges (formerly colleges of education) was 21,463. Nine junior colleges, integrated with the secondary school program of the state but operated with state funds, had a total enrolment of 2,675 students.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the period Sept. 1951 through Aug. 1952, inclusive, public assistance in the state, including federal expenditures and state aid, cost \$78,613,749.45. An average of 126,636 persons received assistance to a total amount of \$73,723,841.89. An average of 13,896 persons received a total of \$4,853,484.43 in general assistance. An average of 71,232 old persons received a total of \$50,816,649.98. An average of 35,176 children were assisted to the total amount of \$12,886,199.76. An average of 912

ALASKAN WAY VIADUCT, double-decker highway along the Elliott bay water front in Seattle, Wash., scheduled to be opened to north-south traffic in Jan. 1953

blind persons received a total of \$892,337.87. The above total amount for public assistance included a total amount of \$3,909,302.87 allotted to an average 5,750 disabled persons. A total of \$360,399.57 was paid by the state for burials during the above period. Administration of the entire program cost \$4,889,907.56. Health care was largely the responsibility of the counties.

During the month of June 1952, 11 state charitable institutions had an average total population of 10,778 and four correctional institutions had an average total of 2,383 inmates. The total expenditures for salaries, wages and operations, exclusive of capital outlays and new construction for both programs during the fiscal year April 1, 1951, to March 31, 1952, were \$10,822,322.56.

Communications.—Railroad mileage in the state was 6,176 on Dec. 31, 1951. On Jan. 1, 1951, there were 178 airports in Washington of which 116 were in class I. The total mileage of highways in Washington on Jan. 1, 1952, was 45,135.6; total mileage of federal-aid highways on the state highway system was 9,615; total mileage on the state highway system was 6,515.8; and the total mileage of highways, roads and streets under county jurisdiction and management was 38,619.8. Total state expenditures for highways during the period Feb. 1, 1951, to Jan. 31, 1952, was \$36,787,235; \$25,171,219 was spent for construction and \$11,616,016 for maintenance and administration.

Banking and Finance.—In 1952 the state board of equalization placed the value of real and personal property at \$4,141,083,552 and equalized for purposes of taxation at \$2,070,541,776. On March 31, 1952, the bonded indebtedness was \$1,152,000; outstanding warrants amounted to a total of \$57,162,568.28. For the year ending March 31, 1952, total receipts were \$569,256,097.19 and disbursements, including cash transfers, were \$537,988,606.57.

On March 31, 1952, 120 banks, including four mutual savings banks, reported a total capital of \$42,130,000; capital surpluses, undivided profits and reserves at \$157,847,040; deposits of \$2,217,229,114; and total assets of \$2,399,957,878.

Total income payments and per capita income payments for 1951 were \$4,257,000,000 and \$1,755, respectively, in both instances an all-time high.

Agriculture.—According to the census of April 1950, the state had 69,820 farms, whose total acreage was 17,369,245 and whose average size was 248.8 acres. Crop land amounted to 4,236,705 acres. Total agricultural income in 1951 was \$583,248,000; receipts from livestock and products were \$207,172,000, from crops \$346,349,000; the total value of production for home consumption was \$25,530,000; and government payments amounted to \$4,097,000. Total agricultural production in 1951

Table I.—Leading Field and Fruit Crops of Washington

Crop	Indicated 1952	1951	Average 1941-50
Wheat, bu.	77,334,000	75,152,000	64,395,000
Apples, bu.	23,725,000	19,108,000	29,458,000
Pears, bu.	4,833,000	5,554,000	7,046,000
Hops, lb.	27,000,000	27,387,000	18,565,000
Potatoes, bu.	10,400,000	11,600,000	9,905,000
Peas (100-lb. bags)	1,287,000	2,398,000	3,091,000
Hay, all, tons	1,451,000	1,431,000	1,682,000
Strawberries (crates)	1,200,000	773,000	630,000
Cherries, tons	17,900	16,200	30,240
Barley, bu.	3,010,000	3,384,000	6,604,000
Oats, bu.	6,240,000	6,670,000	7,454,000

Table II.—Principal Industries of Washington

Industry	Pay roll (for 12-month period ending Sept. 30, 1951)
Logging and lumber products	\$164,300,000
Food products	93,200,000
Plywood, millwork, etc.	69,600,000
Pulp and paper	61,800,000
Chemical (including Hanford)	49,600,000
Basic nonferrous metals	29,900,000
Machinery	27,700,000
Fabricated products (metal)	22,600,000
Basic ferrous metals	14,500,000
Furniture	12,200,000
Shipbuilding	10,800,000

had a value of \$644,611,000 or 111% of 1950.

Manufacturing and Trade.—In 1950 the value added by manufacture was \$1,113,362,000, in contrast with \$926,630,000 in 1949 and \$874,036,000 in 1947. There were 6,022 establishments subject to unemployment compensation in 1951. In July 1952, the civilian labour force of the state was estimated at 1,030,300 of which 1,000,000 were employed. Domestic workers numbered 15,600; agricultural workers 144,400; and non-agricultural workers 840,500. Manufacturing establishments employed 202,200 and nonmanufacturing firms 536,100.

The output of lumber in 1951 was 3,922,000,000 bd.ft. (estimated); pulp and paper production 2,053,000 tons (estimated); and plywood production for the Pacific northwest was 2,984,000 sq.ft. (estimated).

The salmon pack for the Puget sound and Columbia river districts combined was 1,060,000 cases in 1951.

For the year 1951, the Washington customs district reported total exports of \$247,277,052 and imports for consumption of \$219,006,503.

(H. J. De.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Washington in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available.

Table III.—Mineral Production of Washington

(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Clays	217,000	\$ 252,000	220,000	\$ 267,000
Coal	874,000	5,829,000	899,000	6,029,000
Copper	5,057	2,104,000	5,275	2,078,000
Gold (oz.)	92,000	3,224,000	72,000	2,520,000
Lead	10,000	2,790,000	6,000	2,028,000
Sand and gravel	10,606,000	7,435,000	9,216,000	6,391,000
Silver (oz.)	364,000	329,000	358,000	324,000
Stone	4,931,000	5,375,000	3,689,000	4,104,000
Zinc	15,000	4,205,000	11,000	2,664,000
Other minerals	17,152,000	...	14,456,000
Total		\$49,055,000		\$40,863,000

Washington ranks first among the states in the production of magnesite, and stands 29th in the value of mineral output, with 0.41% of the U.S. total.

Washington. DISTRICT OF COLUMBIA, is the national capital of the United States. On July 19, 1952, an act of congress was approved to enlarge the national capital planning commission and create a national capital regional planning council, to the end of securing co-ordinated, comprehensive planning for the entire area, which includes the federal city and near-by towns and counties in Maryland and Virginia. Under the act, the expenses of both planning agencies would be met from federal funds.

Several plans had been prepared for the southwest area selected for redevelopment. The official plan of the national capital planning commission was made public in October. As required by law, public hearings were held by the district commissioners.

Early in the year, the commissioners released a comprehensive highway plan which in some respects differed from the official comprehensive plan of the planning commission.

Under his powers for reorganization of the federal government, the president, on May 1, 1952, issued an executive order to reorganize the district government which, in the absence of objection, became law 60 days afterwards. In addition to re-

grouping the departments of the district government, a new department of administration was created, and a citizens advisory council was appointed.

In connection with a six-year public works program, prepared by the commissioners, a citizens advisory committee on the public works program was appointed. The committee brought in a report approving a six-year program estimated to cost in excess of \$300,000,000, to be paid for partly by the D.C. highway fund and increased water and sewer taxes, with the balance to be shared half and half by the federal and district governments.

During the year the new Mellon fountain, near the National Gallery of Art at the apex of the Triangle in the foreground of the capitol, was dedicated. The golden horses, given by the Italian government, were placed at the entrances to the Arlington Memorial bridge and the Potomac parkway. Queen Juliana of the Netherlands presented a carillon to the United States in a ceremony in Meridian Hill park.

During the year, the president moved back into the White House which had been rehabilitated, redecorated and made safe at a cost of more than \$5,000,000. (See also MUNICIPAL GOVERNMENT.)

Wealth and Income, Distribution of. The 1952 *Survey of Consumer Finances* in the United States, published by the board of governors of the federal reserve system, supplied information on the distribution of income in 1951 and liquid assets in early 1952. Previous surveys had made similar information available for the period 1945–50. The surveys were based on small field canvasses of consumer spending units, defined as all persons living in the same dwelling and related by blood, marriage or adoption who pooled their incomes for their major items of expense.

Survey data on the percentage distribution of spending units according to size of holdings of liquid assets—U.S. government bonds, savings and checking accounts and shares in savings and loan associations and credit unions—are provided in Table I. It may be seen that from 1951 to 1952 the proportion of spending units with medium-sized holdings (\$200–\$1,999) showed a marked decrease—from 37% to 32%. The percentage with no

Table I.—Distribution of Spending Units by Size of Liquid Asset Holdings

holdings increased from 28 to 31. The total number of spending units owning some liquid assets in early 1952 was estimated at 37,000,000, roughly 1,000,000 below the postwar high in early 1951 but about 3,000,000 more than in early 1946.

Table II summarizes data provided by the surveys on the distributions of spending units and total money income according to size of income. The 1951 data revealed a further upward movement in the postwar income distribution. The expansion of total money income in the postwar years resulted in a shifting of many consumers to higher income levels. This shifting pervaded the entire income distribution. It was found that when the nation's spending units were ranked into tenths by size of income the proportionate shares of total money income received by each tenth in 1951 were quite similar to those in 1945.

A longer-term comparison of changes in the distribution of income is afforded by Table III. This shows for two prewar years, peak war year 1944 and full-employment year 1950, the percentage of money income going to each fifth of the total number of families and single persons, ranging from those with the lowest incomes to those with the highest.

From 1935–36 to 1950 there was a redistribution of income in the United States away from the highest income bracket. The second, third and fourth income brackets significantly improved their relative positions, whereas the percentage of total money income received by the highest bracket declined from 53 to 46.

State Distribution of Income.—Income payments to individuals expanded in every state in 1951, the latest year for which department of commerce estimates were available in 1952. Against the setting of a generally expansionary economic situation, total income moved up in most sections of the country at rates similar to the 12% rise for the country as a whole.

The largest regional gain, 15%, was scored by the southwest. (See Table IV.) Above-average gains were also scored by the far west (14%) and southeast (13%). The smallest relative increases occurred in New England (10%) and middle east (9%). For the country as a whole, per capita income payments (total income divided by total population) were \$1,584 in 1951. On a state basis, per capita incomes ranged from \$771 in Mississippi to nearly \$2,100 in Delaware and the District of Columbia. Others in the top rank included Nevada (\$2,029), Connecticut (\$1,999), New York (\$1,996), California (\$1,933) and Illinois (\$1,928).

Table IV reveals clearly the relatively high income levels of the northern and western parts of the country and the concentration of low-income states in the south. Despite the substantial progress they had made over the past two decades, the 15 southern states in 1951 had a composite per capita income 35% below the average for all other states.

From 1940 to 1951, a period of tremendous economic growth, there was a pronounced relative shift of total income from the New England and middle east regions to the south and west. As shown in Table IV, the rates of income expansion in the southwest, southeast, far west and northwest substantially exceeded the nation-wide rise of 220%, whereas the gains in New England and the middle east fell far short of it. The proportionate share of the nation's total income received by the four regions

of the south and west increased 20% from 1940 to 1951, whereas that of the northeastern area (New England and middle east) declined 16%. However, aggregate income in the northeast in 1951 still accounted for more than one-third of the national total. (See also INCOME AND PRODUCT, U.S.) (C. F. Sz.)

United Kingdom.—The 94th Inland Revenue report, published in Jan. 1952, analyzed the distribution of incomes for 1949-50 in great detail. A special inquiry was carried out on the basis of a 10% sample of all taxpayers. The data were tabulated, classified according to size of income on the one hand, and according to type of income and the taxpayer's family circumstances on the other.

Table V.—Distribution of Incomes in the United Kingdom, 1949-50

Range of incomes (in £)	Number of incomes (in thousands)	Amount of income before tax (in million £)	Amount of income after income tax and surtax (in million £)
135- 150	853	122	122
150- 250	6,100	1,217	1,190
250- 500	9,290	3,261	3,102
500- 1,000	2,972	1,943	1,710
1,000- 2,000	600	802	596
2,000-10,000	224	773	439

Taxpayers with an income above the exemption limit for assessment (£135 a year) and their dependents comprised about nine-tenths of the population, the rest consisting mainly of old-age pensioners and juvenile earners. Tables V and VI show, in a summary form, the distribution above the exemption limit; the figures have been officially corrected for certain categories of income which were not fully reported. (It appeared that the distribution for 1949, published in the 1951 White Paper on national income, was later revised. The 1952 national income estimates no longer included a table on the distribution of incomes.)

On March 19 and 21, 1952, the chancellor of the exchequer gave rough estimates for the distribution of incomes at that date. Since 1949 the number of incomes above £500 a year had increased by 2,250,000, of which 350,000 were in the range £1,000-£2,000 and 30,000 above £2,000.

The newly available information made it possible to evaluate the effects of the 1952 budget. According to estimates by Joan Mitchell (*Bulletin of the Oxford Institute of Statistics*, June 1952), about two-fifths of the population became worse off as a result of the changes it introduced. (See also BUDGET, NATIONAL.) (T. BAR.)

Weeks, Sinclair (1893-), designated by Dwight D. Eisenhower to be U.S. secretary of commerce, was born at West Newton, Mass., on June 15. His father was John W. Weeks, secretary of war under Pres. Warren G. Harding. After graduating from Harvard university, Cambridge, Mass., in 1914, he worked for the First National Bank of Boston, Mass., until 1923, except for a period during World War I when he served overseas as a captain with the 101st field artillery. He later became a successful manufacturer, was president of Reed and Barton, silversmith company of Taunton, Mass., and director of a number of large corporations.

Long active in Republican politics, he became a national committeeman for Massachusetts in 1940. He was treasurer of the Republican national committee from 1941 to 1944, and in the latter year served some months in the U.S. senate, on appointment to fill a vacancy.

In 1949 Weeks was chosen national finance committee chairman of the Republican party.

Weeks was an enthusiastic supporter of Eisenhower in the general's bid for the Republican presidential nomination in 1952, and on Dec. 1 President-elect Eisenhower selected Weeks to serve as secretary of commerce during the coming administration.

West Virginia. The 35th state in the Union, West Virginia was admitted conditionally on Dec. 31, 1862, and proclaimed a separate state on April 20, 1863, fully effective 60 days later. It has an area of 24,282.45 sq.mi., of which about 150 sq.mi. are water surface. In 1950 the population was 2,005,552, or only 5.4% more than in 1940. Charleston, the capital, in 1950 had a population of 73,501. Other cities of 10,000 or more population were: Huntington, 86,353; Wheeling, 58,891; Clarksburg, 32,014; Parkersburg, 29,684; Fairmont, 29,346; Morgantown, 25,525; Weirton, 24,005; Bluefield, 21,506; Beckley, 19,397; South Charleston, 16,686; Martinsburg, 15,621; and Moundsville, 14,772. The urban population was 694,487, or 34.6% of the total.

History.—State officers elected in 1952, all Democrats, were: governor, Wm. C. Marland; secretary of state, D. Pitt O'Brien; auditor, Edgar B. Sims; treasurer, Wm. H. Ansel, Jr.; attorney general, John G. Fox; state superintendent of free schools, Wm. W. Trent; and commissioner of agriculture, J. Blaine McLaughlin. They were elected by noticeably decreased majorities which were larger, however, than those in other Democratic border states. At the same time Harley M. Kilgore was returned to the U.S. senate for a consecutive third term, the second in the history of the state; the election of Will E. Neal, Republican, from the 4th district, broke the otherwise solid Democratic representation in congress; Robert H. Mollohan, Democrat, succeeded Robert L. Ramsay in the 1st district.

The year ending June 30, 1952, was one of the worst in the state's history for forest fires. There were 2,111 fires entailing a total loss of several million dollars.

Education.—In 1951-52 the total net enrolment of the 3,719 elementary schools was 293,211. For the 380 high schools (junior and senior) net enrolment was 147,356. There were 10,401 elementary and 5,869 secondary teachers. For the year ending June 30, 1952, total receipts for the public school program were \$74,961,246.78, of which \$24,337,301.41 were collected on general property of local taxing units; \$46,056,699.51 was state aid to the regular program; and \$602,587 was state aid to the county school building programs. Other state funds included, \$38,082.85, aid to crippled children; \$133,286.23, aid to the school lunch program; and \$486,990.79, aid to vocational education. There were nine state-supported institutions of higher learning under control of the state board of education. The state university at Morgantown and Potomac State school at Keyser, a junior college, were under control of a board of governors. There were also eight private and denominational colleges and three private and denominational junior colleges.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ending June 30, 1952, the total expenditure of the state department of health was \$2,259,902, of which \$765,835 were federal funds. The federal funds were used in aid of the following programs: general health, \$220,390; venereal disease, \$64,904; mental health, \$43,490; tuberculosis control, \$72,339; cancer control, \$39,969; heart disease, \$27,183; rapid treatment centre, \$48,927; and maternal and child health, \$248,633. Regular expenditures of the department of public assistance totalled \$26,383,428.45, of which \$8,389,287 was for old-age assistance; \$416,747, aid to the blind; \$11,812,935, aid to dependent children; and \$658,495, aid to permanent and totally disabled persons. General relief items and the respective total expenditures were: crippled children, \$446,886.61; medical and hospital aid, \$935,401.12; correction of vision and prevention of blindness, \$24,705.53; child welfare, \$64,793.03; general assistance, \$1,199,092.80; and boarding care, \$670,388.41. A total of \$1,764,696.65 was spent for personal service, current expenses and equipment.

Communication and Transportation.—The mileage of steam railways was about 7,500. Completion of the Huntington airport at a total cost of about \$2,000,000 made most of the important cities of the state accessible to air transportation. In 1951 the total mileage of public roads and streets was 36,959, of which 32,122 was primary (4,894) and secondary (27,228) roads. As of May 1, 1952, the expenditure of \$36,560,149.44 of a \$50,000,000 bond issue for secondary roads, approved in 1948, had been authorized. On Jan. 1, 1952, there were 332,790 Bell telephones, 41,480 phones on lines of connecting companies and 1,544 phones on nonconnecting lines.

Banking and Finance.—Total state receipts for 1951-52, including a cash balance of \$43,732,649.12, as of June 30, 1951, were \$434,721,626, and total disbursements were \$367,811,753.91, leaving a cash balance, as of June 30, 1952, of \$66,909,872. As of the same date, the unappropriated surplus in the state fund, general revenue, was \$11,865,342.09. As of June 30, 1952, the total bonded indebtedness of the state was \$145,677,000. As of June 30, 1952, the total assessed value of property in the state was \$2,778,170,740.

As of June 30, 1952, deposits in 107 state bank and trust companies totalled \$485,139,520.34, and those of 74 national banks were \$557,905,000. Resources of 21 federal savings and loan associations were \$58,382,484.41; of 15 state building and loan associations \$15,610,412.47; and of 26 industrial savings and loan companies \$15,492,605.41. There were

Table I.—Principal Agricultural Products of West Virginia

Crop	Indicated 1952	1951	Average, 1941-50

139 small loan companies with total resources of \$29,530,335.74 and loans of \$25,361,801.32, and 28 chartered credit unions with total resources of \$987,001.67 and loans of \$846,930.40.

Agriculture.—The total gross farm income for 1951 was \$142,175,000. Of this total \$2,155,000 was government payments, \$24,946,000 was from crops, and \$115,074,000 was from livestock and livestock products, sold and traded. The estimated value of products consumed on the farm where produced was \$44,168,000 which left a net cash income of \$98,007,000, or \$19,896,000 less than in 1950. The production of turkeys continued to increase reaching 1,062,000 head which brought a cash return of \$6,359,000 or \$1,050,000 more than in 1950.

Industry.—Manufacturing continued to expand, the 137,650 employees being 31% more than in 1941. The value of their production for 1951 was about \$1,875,000,000. Construction contracts reached their greatest dollar value in 1951, but the value of building permits fell 30% below the 1950 level. The respective totals were \$102,848,000 and \$31,901,000. The respective total pay rolls and incomes of other important industries were: lumber, 10,847 and \$20,649,333; iron and steel, 40,019 and \$155,025,123; glass, pottery, brick and tile, 30,483 and \$92,585,831; and chemical, rayon, paint, leather, and textiles, 37,031 and \$125,628,180. (C. H. A.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in West Virginia in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not available. West Virginia ranks first among the states in the production of coal, and stands fourth in the value of mineral output, with 7% of the U.S. total.

Table II.—Mineral Production of West Virginia

(In short tons, except as noted)

Mineral	Quantity	Value	Quantity	Value
	1950	1950	1949	1949
Clays	570,000	\$ 925,000	478,000	\$ 759,000
Coal	144,116,000	754,370,000	122,611,000	649,697,000
Coke*	3,691,000	40,765,000	3,360,000	36,906,000
Lime	?	?	350,000	3,535,000
Natural gas (thousand cu.ft.)	189,980,000	31,907,000	181,176,000	29,296,000
Natural gasoline (bbl.)	1,048,000	2,899,000	997,000	2,945,000
Petroleum (bbl.)	2,808,000	9,350,000	2,839,000	8,770,000
Petroleum gases (bbl.)	3,575,000	4,195,000	2,763,000	3,591,000
Salt	368,000	1,239,000	356,000	1,289,000
Sand and gravel	3,613,000	6,241,000	3,285,000	5,491,000
Stone	5,368,000	7,826,000	4,855,000	6,960,000
Other minerals	10,662,000	...	5,786,000
Total		\$829,624,000		\$718,119,000

*Values for processed materials are not included in the totals.

†Value included with other minerals.

Wheat. In wheat the year 1952 brought the emerging shadow of a surplus problem. The U.S. wheat crop of 1,298,921,000 bu. was almost as much as the record, about one-third larger than the 987,474,000 bu. of 1951 and substantially above the 1941-50 average of 1,084,664,000 bu. Seeded acreage of 77,500,000 ac. was large, and winter kill and other damage much less than in 1951, resulting in 70,407,000 ac. for harvest, or about 15% more than the 61,424,000 ac. of 1951 and the 63,354,000 ac. average of 1941-50. Average yields, too, were excellent at 18.4 bu. per acre, as compared with 16.1 bu. in 1951 and 17.7 bu. for the decade.

The winter wheat crop, which fortunately matured before the intense summer drought in the southern Great Plains, was 1,062,590,000 bu., the largest on record, 65% larger than the 645,469,000 bu. of 1951 and one-third larger than the 799,977,000-bu. average of 1941-50. The average yield of 21.1 bu. per acre was large, compared with only 16.2 in 1951 and an average of 17.7 bu. per acre for the previous decade.

A spring wheat crop of 236,331,000 bu. was sharply below the excellent crop of 342,005,000 bu. in 1951 and the 1941-50 average of 284,687,000 bu. Seeded acreage, though below March intentions and the 21,662,000 ac. harvested in 1951, did give 20,129,000 ac. for harvest, as compared with a 1941-50 average of 18,110,000 ac. The average per acre yield of 11.7 bu. was

Table I.—U.S. Wheat Production by Leading States
(In thousands of bushels)

State	Prelim. 1952	1951	Average 1941-50
Kansas	308,676	126,113	197,949
Oklahoma	108,927	38,902	71,737
North Dakota	102,309	150,975	140,940
Nebraska	97,371	58,073	70,067
Montana	77,458	97,988	72,532
Washington	77,334	75,152	64,395
Ohio	56,700	34,308	46,908
Colorado	50,159	34,967	37,371
Illinois	44,762	33,383	27,106
Idaho	42,352	37,968	32,160
Texas	40,380	17,307	60,347
Indiana	39,470	23,529	29,828
Michigan	38,186	30,800	24,625
South Dakota	30,681	57,260	41,914
Oregon	30,568	28,999	23,350

Minnesota	17,166	20,022	20,346
California	14,630	9,741	10,990
New York	12,880	10,319	8,504

sharply below the average for the decade and the 15.8 bu. of 1951.

Durum wheat, which has hard, vitreous kernels high in protein and is used largely in macaroni and similar pastes, was a small crop of only 21,424,000 bu. in 1952, as compared with 35,820,000 bu. in 1951 and a 1941-50 average of 37,950,000 bu.

Hard red winter wheat from the southern Great Plains continued to be the strongly dominant class with 715,749,000 bu., compared with 376,636,000 bu. in 1951 and an average for 1941-50 of 520,816,000 bu. Soft red winter wheat was also abundant, 203,556,000 bu., as compared with 150,748,000 bu. in 1951. The hard red spring class of 177,962,000 bu. was sharply less than the 261,830,000 bu. of 1951 and moderately lower than the 212,899,000 bu. average for 1941-50.

U.S. wheat and flour exports in 1951-52 went much beyond preliminary estimates, reaching 477,883,000 bu. (wheat equivalent), exceeded very slightly by exports in 1947-48 and moderately by the 505,304,000-bu. record of 1948-49. The value of the wheat exported in 1951-52 was \$1,066,800,000, as compared with \$748,700,000 the previous year. Approximately the full U.S. quota of about 253,000,000 bu. committed under the International Wheat agreement was taken in 1951-52, and in October about one-third of the quota for the new year had been sold. Additional export amounts moved under Mutual Security agency financing. In fact, of 28,396,000,000 lb. of U.S. wheat exported in one form or another (of 47,283,000,000 lb. of all food exports), 12,137,000,000 lb. moved to MSA-participating European countries and 10,426,000,000 lb. to Asia, mostly India and Japan.

Feed wheat, frost-shrivelled wheat from Canada, in amount of 29,920,000 bu., valued at \$47,562,000, was imported in 1951-52, as compared with 11,647,000 bu. in the previous year. Less than 8,000,000 bu. of other wheat came in, mostly from Canada, to be milled in bond and exported.

Prices fluctuated moderately during the year, rising to approximately the loan level of \$2.20 per bushel to producers early in the year before the new crop came to market, then dropping below the loan level to an average of \$2.07 per bushel in October, as compared with \$2.10 a year before. Farmers were officially advised to hold some of their wheat off the market and place it under the support structure to improve prices—and it appeared that as much as 500,000,000 bu. might be put under the support program; the rate into September was double that of the previous year.

In summary, the total U.S. wheat supply for 1952-53 was estimated at 1,577,000,000 bu., consisting of 1,298,000,000 bu. from the new crop and old stocks of 254,000,000 bu., plus perhaps 25,000,000 bu. of imports, mostly feed wheat. About 700,000,000 bu. would be required domestically for food, seed and feed, leaving about 875,000,000 bu. for export and carry-over. Exports, including 253,000,000 bu. under the International

Wheat agreement on which initial export subsidies of 36 to 50 cents per bushel were authorized in June, would amount to at least 300,000,000 bu., leaving a carry-over July 1, 1953, perhaps as high as 575,000,000 bu. The government faced this situation by announcing a national wheat goal of 72,000,000 ac., down from 77,500,000 ac. in 1952, which at average yields would produce 1,080,000,000 bu. in 1953, to be supported at not less than \$2.21 per bushel.

Table II.—World Wheat Production for Selected Areas

Country	(In millions of bushels)			Average, 1935-39
	Estimated 1952	1951	1950	
United States	1,298	987	1,019	759
Canada	688	553	462	312
Mexico	18	16	20	14
Europe	1,635	1,580	1,525	1,599
Great Britain	81	86	97	62
North Africa	99	76	87	73
Union of South Africa		25	26	16
Asia	1,625	1,630	1,535	1,498
India	245	246	235	262
Pakistan	125	148	148	117
Argentina	250(?)	75	213	222
Australia	150(?)	161	184	170
U.S.S.R.	1,110	1,240
World total	7,150	6,485	6,320	6,024

A record 1952-53 world wheat crop of as much as 7,150,000,000 bu. was indicated in autumn 1952, as compared with an above-average crop in 1951-52 of 6,485,000,000 bu. The acreage was estimated at 444,610,000 ac., as compared with 427,490,000 ac. in 1951 and 418,940,000 ac. prewar.

North America contributed about 30% of the total, and the Canadian record crop was more than twice as large as the pre-war average. The initial price paid by the Canadian Wheat board to producers was increased from \$1.40 to \$1.60 per bushel.

Production in most other major regions increased somewhat as compared with 1951-52.

Turkey became a source of nondollar surplus grain when its estimated record crop of 11,500,000 metric tons provided as much as 2,000,000 tons for export. Syria had a record crop and France's crop of 295,000,000 bu., 14% more than in 1951, was expected to provide some exports.

Stocks as of July 1 in the principal exporting countries were preliminarily estimated at 35,000,000 bu. in Argentina (85,000,000 bu. in 1951 and 134,000,000-bu. average); in Australia, 80,000,000 bu. against 100,000,000 bu. in 1951; in Canada, 270,000,000 bu., as compared with 235,000,000 bu. in 1951 and an average since the war of 157,000,000 bu. These, with U.S. stocks, gave a total of about 639,000,000 bu., as compared with 816,000,000 bu. July 1, 1951, but only 559,000,000 bu. as average 1945-49.

Meanwhile, Argentina, normally an important wheat exporter, contracted to buy 206,000 tons of U.S. wheat, for shipment in Aug.-Oct. 1952, in a triangular deal which was reported as involving movement of 254,000 tons of Argentinian corn to France and 200,000 tons of French barley to the U.S. Canada's exports of wheat and flour in 1951-52 were 356,100,000 bu., second only to the record 407,600,000 bu. exported in 1928-29. The United Kingdom in September agreed to buy 115,000,000 bu. of wheat from Canada under the International Wheat agreement during 1952-53, somewhat more than in 1951-52.

Delegates from 46 countries met in London for three weeks in April and May to lay the basis for an extension of the International Wheat agreement due to end July 31, 1953. They were reported to have reached a deadlock on quantities and prices, the exporting countries wanting something more than \$2.00 per bushel maximum price, as compared with \$1.80 under the existing agreement and a world price of perhaps \$2.40 per bushel. Additional efforts at renewal were scheduled for late in 1952 and early in 1953.

PLANNING MERCY FLIGHTS to bring food to starving deer in the Alps mountains, from a U.S. air force base near Munich, Ger., early in 1952

Wildlife Conservation. The increasing emphasis by wildlife conservationists in the United States on the interrelationships of all aspects of natural resources conservation was significantly evident in 1952 in the proposal of a "national policy for renewable natural resources" formulated by 36 conservation and scientific organizations comprising the Natural Resources Council of America. Presented at the North American Wildlife conference in Miami, Fla., on March 18, the policy—designed "to provide the means for a high standard of living in a healthful environment"—was described as "for the use of our basic resources of soil, water, plants, and animals, so as to maintain them through the years and prevent their waste and depletion." The ten-point policy recommended called for (1) inventories of renewable resources and (2) a "comprehensive scientific conservation plan for every farm, ranch, small watershed, and other operating unit of the nation's land and water." It outlined (3) a nine-point policy of use, emphasized (4) the responsibility for conservation that goes with land ownership and recommended (5) that "a sufficient number of examples of every type of natural area should be preserved and kept perpetually as inviolate natural and wilderness areas for their scientific, educational, and esthetic values." It called for (6) efficient resource administration, urged (7) public participation in conservation and stressed (8) "national need versus political expediency." The policy's ninth point maintained: "An independent Board of Review, composed of five members who have no affiliation with any federal agency but have outstanding interest in public affairs, should be created to review the need, cost, and desirability of all federal land and water projects and basin-wide programs." Finally the statement declared that, "To make this policy effective, Congress should pass legislation enacting it into basic law." Endorsed at its Miami introduction by a panel of speakers, including United States Sen. James H. Duff of Pennsylvania and Rep. Clark W. Thompson of Texas, the policy was widely distributed during the year and steps leading toward its adoption by the congress were taken at the Natural Resources council's annual meeting

held Oct. 9 to 11 in the Okefenokee National Wildlife refuge in Georgia.

A significant event of the year was the publication of *The Conservation Yearbook, 1952*, first in a series of annual volumes projected under the editorship of Erle Kauffman, published by the Conservation Yearbook, 1740 K Street N.W., Washington 6, D.C. Subtitled "A Directory and Guide to Facts, Figures, and People in American Conservation," the 288-page volume was presented in several sections: Conservation and Legislation, Conservation Organizations, The Conservation Estate, Conservation Facts and Figures, Conservation Publications and an index. (See also NATIONAL PARKS AND MONUMENTS.) (H. Z.)

Canada.—National Wildlife week was observed throughout Canada from April 6 to 12, 1952, inclusive; it was dedicated to the memory of Jack Miner, whose work in wildlife conservation had been universally acclaimed. The Canadian Conservation association, whose activities had been suspended in 1943 as a result of the war, was reorganized in 1952.

Despite a fourfold increase in hunting between 1948 and 1952, Ontario game authorities stated that the province's supply of moose, deer, pheasants, Hungarian partridges and ruffed grouse was holding up well, and even increasing, as a result of restocking programs. Conservation measures in Saskatchewan had brought beaver back so far that the 1952 season was extended five months and trapping quotas were raised from one to two or three per colony. In 1947 there were less than 600 beaver houses in the Quinte district of Ontario; in 1951 a census revealed there were 3,427 beaver houses; the increase was credited to improved forest management and forest protection programs.

The United States organization, Ducks Unlimited, budgeted \$2,000,000 for water conservation projects in Canada, to be spent at the rate of \$500,000 per year beginning with 1953. The 1952 appropriation totalled \$300,000, of which \$112,000 was used to build dams in Alberta. The Ontario government announced a province-wide water conservation program, in which farmers would be assisted in building farm ponds. Two workers of the U.S. wildlife service found the summer breeding ground of the whooping crane in Great Slave lake marshes. (C. Cy.)

Other Countries.—The third general assembly of the International Union for the Protection of Nature was held in Caracas, Venezuela, during Sept. 3–9. Delegates and observers from 29 countries and representatives of several international bodies attended. Technical meetings were held at which the following subjects were considered: the effects of fire on vegetation; the preservation of wildlife in semiarid regions; the preservation of endemic zoological and botanical species on small islands, especially in the Caribbean sea; and the raising of rare animals in semicaptivity outside their natural habitat.

Many resolutions were adopted, an important one being that the import of animals illegally taken in their native country should be prohibited in all other countries.

Acting under the National Parks and Access to the Countryside act of 1949, the Nature Conservancy established seven nature reserves in England and one in Scotland—one other in Scotland, the Beinn Eighe, having been established in 1951. These reserves ensured the preservation of areas of special botanical and faunal interest. A government bill, the Poaching of Deer (Scotland) bill, was introduced and passed all stages in the house of lords, and the Deer (Close Season) committee was set up to consider the question of a closed season for deer in Scotland.

The government of India set up a Central Board for Wild Life under the chairmanship of the maharaja of Mysore. Many interested bodies were represented, among them the Bengal and the Bombay natural history societies. The name of the Kaziranga reserve in Assam was, in keeping with the times, changed to Kaziranga Wild Life sanctuary. It was estimated that there were at least 150 Great Indian rhinoceroses in the sanctuary, being probably about half the total number of this species of rhinoceros still existing in the world.

In South Africa the Eastern province branch of the Wild Life Protection society took steps to protect the vanishing oribi and opened an Oribi fund. Oribi were introduced into the Mountain Zebra national park.

The government of Uganda, coming into line with other governments in Africa, established two national parks. The Queen Elizabeth national park of 700 sq.mi. was formed in the western rift between Lake George and Lake Edward. The 1,200 sq.mi. of the Murchison Falls national park include the falls themselves where the Nile plunges through a narrow gap.

The great reduction in the numbers of the American flamingo (*Phoenicopterus ruber*), a species centred around the Gulf of Mexico, having been a cause of concern, a survey of its status and remaining breeding localities was carried out under the auspices of the National Audubon Society of New York. The critical place for the survival of the flamingo proved to be the Bahamas where no less than 53% of the total world population breed on Inagua Island. An appeal in the Bahamas to save the flamingo received a gratifying response and the Society for the Protection of the Flamingo in the Bahamas was formed.

In Italy the existence of the Gran Paradiso national park was threatened by hydroelectric works, but the appeal of the park authorities to the supreme court in Rome was successful, and the park, together with its wildlife, particularly the alpine ibex, was saved.

(C. L. BE.)

Wiley, Alexander (1884–), U.S. senator, was born on May 26 at Chippewa Falls, Wis. He took undergraduate work at Augsburg college, Minneapolis, Minn., from 1902 to 1904, then studied law at the University of Michigan, Ann Arbor (1904–06), and took his law degree at the University of Wisconsin, Madison, in 1907. Admitted to the Wisconsin bar that year, he set up practice in his native town. From 1909 to 1915 he was district attorney of Chippewa county;

he also engaged in farming and banking. In 1938 he was elected as a Republican to the U.S. senate; he was re-elected in 1944, and again in 1950 for the term 1951–57. When the Republicans gained control of the 80th congress in the fall elections of 1946, Wiley was named chairman of the senate judiciary committee (Jan. 1947). A member of the conservative wing of the Republican party, he was in opposition to most of the New Deal and Fair Deal domestic programs. Although maintaining a critical attitude toward the Roosevelt and Truman foreign policies, he frequently supported them—voting, for example, for U.S. entry into the United Nations and disagreeing in Jan. 1951 with the views of both Herbert C. Hoover and Sen. Robert A. Taft on foreign policy. On April 19, 1952, Sen. Wiley declared that the Democratic foreign policy had been at least partially successful and that therefore the Republicans should not criticize it across the board.

Wilson, Charles Erwin (1890–), U.S. business executive and government official, was born on July 18 at Minerva, O. After graduating from the Carnegie Institute of Technology, Pittsburgh, Pa., in 1909, he went to work as an electrical engineer for the Westinghouse Electric and Manufacturing company, where he designed the first automobile “self-starting” motor produced by that company. He joined General Motors corporation in 1919 as an executive of one of the subsidiary companies; in 1929 he became a vice-president of the corporation and in 1941 president. During World War II Wilson was a key figure in the U.S. armament program, and General Motors was awarded war contracts valued at approximately \$12,000,000,000. Both during and after the war period he continuously pointed to the need for a permanent U.S. defense program that could be diverted speedily to war or peace production with a minimum of economic dislocation.

Wilson (sometimes confused with Charles Edward Wilson, a president of General Electric company and director of the Office of Defense Mobilization from 1950 to 1952) was chosen to be the new U.S. secretary of defense by Dwight D. Eisenhower on Nov. 20, 1952.

Windward Islands. The British colonies of Grenada, St. Vincent, St. Lucia and Dominica, forming the southern part of the Lesser Antilles in the Caribbean, constitute the British Windward Islands. Pop.: 95% Negro; some Caribs on Dominica. Language: English; on Dominica and St. Lucia also French patois. Religion: Christian. Governor in 1952, Sir Robert Arundell.

History.—During 1952 all four colonies of the Windward Islands completed their first year under new constitutions, which granted full adult suffrage and provided increased power to the elected representatives. The growing pains which are almost inseparable from such a development—especially when it is accompanied by a growth of trade unionism, as in the Windwards—were not absent; but there were no serious troubles. Particular interest was attached to the appointment of a Jamaican, H. L. Lindo, as administrator of Dominica.

In St. Vincent, the sea island cotton crop was very good; and the Leeward Land Settlement estates, growing cotton, arrowroot and other crops, showed a handsome profit. The team of experts which visited St. Lucia in 1951 issued a comprehensive report on the island's agriculture, and a colonial development and wel-

	Area (sq.mi.)	Population (1946 census)	(1951 est.)	Capitals	(1946 census)
Grenada	133*	72,387	76,000	St. George's†	(5,774)
St. Vincent	150*	61,647	68,000	Kingstown	(4,831)
St. Lucia	233	70,113	81,000	Castries	(7,056)
Dominica	305	47,624	55,000	Roseau	(9,751)

*Excluding the Grenadines (8 sq.mi.) attached in part to Grenada and in part to St. Vincent. †Seat of governor.

fare grant of £200,000 was made to help in the implementation of its recommendations. The development on Dominica of a livestock centre and land-use experimental station went ahead satisfactorily. On the other hand, some anxiety was felt in Grenada at the fall in the price of nutmegs, the island's chief crop.

Education.—Average school attendance (1951): Grenada (1950) 13,500; St. Vincent 9,612; St. Lucia 9,251; Dominica 6,457.

Finance and Trade.—Monetary unit: British Caribbean dollar, valued in 1952 at 58.33 cents U.S. Figures in the table are in British Caribbean dollars.

	Budget (1952 est.) Revenue*	Expenditure*	Foreign Trade (1951) Imports	Exports
Grenada	\$3,231,875	\$3,274,554	\$7,897,358	\$6,130,996
St. Vincent	1,649,581	1,914,037	4,492,457	2,590,801
St. Lucia	2,249,642	2,498,506	6,067,777	2,399,418
Dominica	1,496,100	1,877,210	5,224,065	2,728,932

*Excluding grants-in-aid and Colonial Development and Welfare.

Principal exports: arrowroot, bananas, citrus products, cocoa, copra, sea island cotton, mace and nutmegs, sugar. (P. H-Mv.)

Wines. Total world wine production during 1952 amounted to 4,922,700,000 gal., according to official reports and estimates, compared with 5,170,700,000 gal. during 1951 (a more accurate figure), approximately a 5% decrease. Some figures, notably those from Soviet-influenced countries, were pure estimates.

France, the largest producer of wine in 1952, decided to reduce the area of its vineyards by 16% to increase over-all quality and to limit production. The total production of famous growth (*Appellation Contrôlée*) wines was of very fine quality and somewhat in excess of the 116,000,000 gal. produced in 1951. The famous growths of Burgundy produced 2,110,000 gal. against 2,375,000 the previous year, the quality being very satisfying. Bordeaux over-all production showed a 15% decrease, the red wines equalling and the white wines being 50% less than 1951 production, because of violent hailstorms; however, the quality of both was excellent. Alsace produced good quality wine but with a 30% decrease in quantity. Champagne produced 10,560,000 gal., double that of the 1951 yield and of good quality. Algerian production was off 17% from 1951.

In Spain the Jerez district produced a normal quantity of 9,250,000 gal. against 10,560,000 gal. in the previous year. In Portugal port wine, controlled to a diminishing world demand, was held to 4,878,000 gal., 16% less than in 1951; Madeira pro-

PORT VINTAGE TIME in Alto Douro, Port., where the villager's day began with a walk along miles of dusty roads to his place in the terraced vineyards above the village; grapes ready for pressing were then picked until sunset

duced 1,900,000 gal.

United States production for 1952 was estimated to be slightly less than that of 1951, while wine consumption, spurred by heavily increased taxes on spirits, rose greatly. In California a marketing order was established to control the quality of grapes used for wine.

During 1951 the International Wine bureau made plans to issue two new publications—a dictionary of wine terms in four languages and an atlas of all wine-growing areas of the world.

(J. WE.)

Wisconsin. One of the north central states of the United States, Wisconsin, popularly called the "Badger state," entered the union as the 30th state in 1848. Area: 56,154 sq.mi., of which 1,449 sq.mi. are water. Pop. (1950 census) 3,434,575 (1951 estimate) 3,475,000. Capital, Madison (1950 census, 96,056). Milwaukee (637,392) is the largest city. Other large cities are Racine (71,193), Kenosha (54,368), Green Bay (52,735) and La Crosse (47,535).

History.—The Republican party swept Wisconsin in the 1952 elections. For president, Dwight D. Eisenhower defeated Adlai Stevenson by 357,569 votes, polling 979,744 to Stevenson's 622,175. Gov. Walter J. Kohler, Jr. (Rep.), was elected for a second term by a record gubernatorial plurality of 403,620. Fred R. Zimmerman (Rep.), perennial secretary of state, led his ticket with the largest vote ever received by any candidate in the history of the state, 1,039,317. Also re-elected by margins of more than 400,000 votes were George M. Smith (Rep.), lieutenant governor; Warren R. Smith (Rep.), state treasurer; Vernon W. Thomson (Rep.), attorney general. U.S. Sen. Joseph R. McCarthy (Rep.) was re-elected by a plurality of 145,721. A constitutional amendment to permit redistricting of the state on a 60-40 population-area basis instead of strictly in proportion to population was defeated by a narrow margin.

World Production of Wine

Country	1952	1951	Average	Quality 1952
	(Millions of gallons)

Yugoslavia	156.7*	156.7	124.6 (1935-39)	
Total	4,922.7	5,170.7		

Countries like the United States, marked "No variation" in the above table, produce uniform wines from year to year because of stable climatic conditions and methods of production used.

*Provisional figure, same as previous year.

Education.—There were 5,530 elementary schools, 443 secondary schools, 23 county normal schools and 9 state colleges in 1951-52. Total elementary school enrolment was 355,509; secondary schools 148,380; county normal schools 1,149. Elementary schools employed 14,484 teachers; secondary schools 6,866; county normal schools 114. Faculty members in the state college numbered 587, teaching 7,361 college and 2,235 training-school students. During the fiscal year 1950-51, state aids to education amounted to \$21,681,178; total expenditures in elementary and secondary schools were \$131,790,676.

Social Insurance and Assistance, Public Welfare and Related Programs.—The number of cases receiving public assistance as of June 30, 1952, was as follows: general relief 5,432; old-age assistance 51,117; aid to the blind 1,331; aid to the totally and permanently disabled 969; aid to dependent children in their own or a relative's home 8,321; aid to dependent children in a foster home 1,481; a total of 68,651 households. Expenditures for public assistance in the year ending June 30, 1952, were: general relief \$4,503,230; old-age assistance \$33,335,191; aid to the blind \$979,238; aid to the totally and permanently disabled \$733,825; aid to dependent children in their own or a relative's home \$11,210,417; aid to dependent children in a foster home \$855,619; making a grand total of \$51,617,520. Civilian unemployment benefits for the fiscal year 1951-52 totalled \$11,135,638; contributions collected amounted to \$18,326,505.

The cost of operating Wisconsin's 12 charitable, mental and correctional institutions for the year ending June 30, 1952, was \$14,233,980. The average daily population for June 1952 was 7,348.

Communications.—Public highways as of Jan. 1, 1952, totalled 95,012 mi. divided as follows: 86,004 (towns), 2,532 (villages), 6,476 (cities). Expenditures by the highway commission during the fiscal year 1951-52 were \$76,115,261. Railway mileage (steam and electric) as of Dec. 31, 1951, was 6,493.35 with 54.86 mi. of trolley coach route (trackless). On Jan. 1, 1952, there were 1,020,691 telephones. As of Oct. 1, 1952, there were 144 airports and 11 seaplane bases.

Banking and Finance.—As of June 30, 1952, there were 95 national banks which had deposits amounting to \$1,546,791,000 and assets of \$1,653,530,000. At the end of the calendar year 1951, state banks numbered 462, an increase of 1 over 1950. Deposits totalled \$1,713,085,960; assets were \$1,837,277,223. Credit unions increased from 542 in 1950 to 557 in 1951, and listed assets of \$54,655,174. Assets of the 113 state-chartered savings and loan associations were \$303,641,644.

State receipts for the fiscal year 1951-52 were \$241,643,648; disbursements amounted to \$257,325,876. Taxes collected by the state and returned to local subdivisions totalled \$73,920,119; agency collections returned to counties were \$2,563,871; state aids were \$72,942,572; transferred from the general fund to other funds (building fund, retirement fund, veterans' fund, etc.) \$27,017,514.

Agriculture.—Total acreage harvested in 1952 was 9,825,000. Cash receipts in 1951 amounted to \$1,127,517,000 consisting of \$1,009,666,000 from livestock and livestock products and \$117,851,000 from crops. In 1952, although some crops showed a slight decrease in quantity below 1951, the quality was higher. Canning crops, except tomatoes, were larger than average.

Manufacturing.—The total value of manufactured products in Wisconsin increased from \$2,360,947,000 in 1949 to \$2,687,346,000 in 1950. The most important industries in value of manufactured products in 1949 were machinery (except electrical), food and kindred products, paper and allied products, transportation equipment and fabricated metal products. In 1951 the estimated average number of wage earners in Wisconsin manufacturing establishments was 459,700 as compared with 426,800 in 1950 and 405,500 in 1949. The average estimated weekly pay roll rose from \$20,752,000 in 1950 to \$24,735,000 in 1951. (C. L. L.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Wisconsin in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not available. Wisconsin ranks 34th among the states in value of mineral output, with 0.35% of the U.S. total.

Table I.—Principal Crops of Wisconsin

Crop	Indicated 1952	1951	Average, 1941-1950
Corn (bu.)	124,280,000	103,759,000	111,416,000
Oats (bu.)	130,118,000	143,302,000	117,913,000
Tobacco (lb.)	22,002,000	22,889,000	32,468,000
Potatoes (bu.)	11,115,000	9,805,000	12,820,000
Barley (bu.)	3,150,000	6,633,000	8,364,000
Wheat (bu.)	1,784,000	1,856,000	2,000,000
Flaxseed (bu.)	145,000	150,000	145,000
Soybeans (bu.)	666,000	638,000	514,000
All hay (tons)	8,440,000	8,883,000	6,786,000
Alfalfa (tons)	3,223,000	3,566,000	3,957,000
Alfalfa and timothy (tons)	4,627,000	5,021,000	2,361,000
Cherries (tons)	10,900	14,500	12,750
Cranberries (bbl.)	195,000	194,000	147,100
Apples (bu.)	1,204,000	1,207,000	936,000

Women's Fashions. The year 1952 was one of transition in women's fashions. The silhouette was in the process of slimming and softening: the full-blown skirts over crinolines, petticoats and stiffened linings began to narrow down; the stiff taffeta, faille, alpaca and starched cottons of 1950-51 were replaced by more supple silks such as crepe, barathea and chiffon. Hard-finished wools gave way to spongy tweeds, sheer wools and jersey.

The full skirt remained popular with young girls, but they also welcomed the "siren sheath" for both day and evening wear. This was not the shapeless bag of the 1920s; it outlined the figure closely from bosom to hipline. The waistline area was often indented with a wide cummerbund, satin sash or elastic belt or gored in to a princess line without a belt. The nipped waistline in suits and the tiny cinched waist in dresses relaxed and deepened into the long curve of the hourglass torso.

Skirt shapes kept to a smooth moulded hipline but often flared out below in pleats, "morning glory" gores or trumpet flounces. There were many all-over pleated dresses and by new processes the pleating was rendered permanent, crease-resistant and often washable. Hemlines were on the downward trend, dropping about one inch a season.

In the second half of the year, the silhouette assumed bulk at the top and suits and coats lost their form-fitting shape. The concave front, "spoon back" and the straight cardigan replaced the fitted jacket. Coats narrowed from "tents" to "columns."

It was a year of elaborate "hidden" dressmaking; even narrow skirts were silk-lined to rustle and round out over the hips and bodices for both day and evening were boned.

The death of King George VI of England and the accession of the lovely young Queen Elizabeth II brought a flurry of revived Elizabethan fashions and fashion terms: the long pointed Tudor bodice, upstanding Elizabethan collars, farthingale pads at the sides of the skirts and jewelled velvet dresses. Tiaras and little crowns became evening jewellery fads.

Italy and Spain both vied for attention as new centres of fashion inspiration. Leading designers in Rome and Florence organized showings for United States buyers and for the press. *Couturiers* in Madrid and Barcelona followed suit.

Italy influenced shoe fashions with mule sandals, held on by narrow bands across the instep, leaving most of the foot bare. Barefoot shoes were worn on the street as well as for sport and evening.

Throughout the year, fabric was the focal point of fashion. A long-haired, curly wool called "poodle cloth" by its originator, Jacques Lesur, dominated the coat-fabric field and became a popular byword. After poodle cloth came straight-haired wools, carefully brushed and silky, and other thick, downy cloths. Tweeds returned to fashion and were used more for cosmopolitan than country clothes. Silk was the leading dress fabric, even in the budget-priced field. Silk crepe, chiffon and oriental gauzes assumed importance as the silhouette narrowed and softened. Silk and velvet coats were a favourite afternoon and evening fashion.

Much prominence was given to the "miracle fabrics" of synthetic yarns which boasted superperformance in washing, quick drying and insulation against heat and cold.

The "sweater girl" came back into prominence; the 1952 sweater was highly decorative, form fitting and individual—a far cry from the college girls' "sloppy Joe" of the war years.

Above, left: DRESS AND JACKET of screen tweed, a 1952 spring costume

Above, right: EVENING GOWN giving the elongated look for exaggerating the length of the figure, a fashion note characteristic of 1952

Below, left: THE PENCIL SLIM skirt of 1952, worn here with hip-hugger cardigan jacket

Below, right: WOOL FLEECE wrapped coat with the batwing sleeves popular in 1952

Below, Centre: THE YOKED HIPLINE of 1952

Sweaters were patterned in stripes and in plaids, and elaborate beading made the evening sweater opulent and expensive.

Necklines stopped plunging and curved in wide shallow arcs. Strapless dresses were usually veiled with fichus or stoles. The stole was the most popular all-round accessory, being worn any time from morning until night in fur, knit, wool to match the suit, dress or coat and in sweeping satin or tulle for evening.

Hat fashions, long limited to the small hat worn flat on top of the head, changed noticeably to higher, pointed shapes and moved very sharply forward, backward or to one side. Pointed helmets and turbans completely concealed the hair. Elaborately jewelled evening caps, pillboxes and evening veils were popular. Hats were light and soft and seldom elaborately trimmed except for jewel embroidery.

The "poodle cut" and the "pony tail" hairdo were the favourite of smart women as well as young girls. By the summer of 1952, however, hair began to go glamorous, with a return to soft waves and long bobs. The "Mamie bang," imitating Mrs. Dwight Eisenhower's neat forehead ringlets, became a pronounced fad.

Also growing bulkier, more noticeable and "noisy" was jewelry. Many-strand pearl bibs and long or large loop earrings glittered at throat and ears, with both day and evening wear.

(E. L.)

Wool. Because of drought conditions in some of the major southern hemisphere wool-producing nations, world production figures of wool in 1951 were necessarily revised downward, although they were still larger than the 1950 totals. Although adverse weather conditions continued in some areas in 1952, it was believed that production of wool for that year probably showed a slight increase over 1951. The high price of wool in 1950 and 1951 caused a rise in the number of sheep, the wool from which appeared to have offset a large part of the loss by drought. Because of greatly reduced prices for wool in 1952, however, the slaughter of sheep for meat apparently increased, with the result that pulled wool production was probably higher in 1952 than in 1951.

For the second successive year, the apparel wool industry throughout the world encountered consumer resistance to high prices for wool clothing, and the consumption of apparel wool declined substantially. On the other hand, carpet wools were in good demand and prices were strong, mainly because two large sources of supply, China and Tibet, were virtually eliminated from the world markets.

In spite of a drop in the use of apparel wools in 1952, sales held up remarkably well in most producing countries with the exception of Argentina. In that country the holding of wools for sale well above the world price level resulted in such a small volume of business that unsold wool stocks accumulated in 1951 and 1952 to the largest total ever recorded, with several hundred million pounds believed unsold in that country by Sept. 1952. Since the depressed state of the apparel wool in-

dustry was world-wide, statistics in the United States during the first nine months of 1952 merely tended to confirm this fact. Wool production in the United States was estimated to have increased about 5,000,000 lb., but consumption of apparel wools in that country declined at the rate of about 112,000,000 lb., or 20%, for the year.

The world price for apparel wools declined throughout much of the first nine months of 1952, and in September average prices in the United States, closely following the world markets, were about \$1.50 per clean pound compared with \$1.70 the first of the year, and the record high of \$3.63 in March 1951.

At the reopening of the wool markets in Australia in September, prices continued to ease and aggravated still further the buying policies of the large consuming countries. These lower prices, however, were followed in late September by firming tendencies and by the middle of October wool prices were steady to strong throughout the world. (See also TEXTILE INDUSTRY.)

(S. L. L.)

Words and Meanings, New. English adds many new words to its vocabulary every year, some destined to live long, others to die soon. The words listed below, pertaining largely to 1951-52, are but a small residue of those collected by the committee preparing this article.

Several groups of the coinages below may be commented upon briefly. As usual, scientific and technological advances were well represented among the new words and meanings: witness "ATA," "Dormison," "intoximeter," "isonicotinic acid (hydrazide)," "J factor," "Krilium," "miniaturization," "printed circuit," "pyromen," "radio-carbon calendar" and "weedicide." New terms such as "ANZUS," "bamboo curtain," "Bevanism," "brain-changing," "globalist," "Manchurian fever," "rotatee," "Saceur" and "uranium curtain" reflected the international scene. The U.S. scene was represented by a number of interesting coinages in a variety of fields: for example, "ADC," "bafflegab," "cool jazz," "creepie-peepie," "cronyism," "great debate," "hot rod," "Like-Iker," "panty raid," "Pentagonese," "poodle cut," "stretch-out" and "telethon."

The words listed below became prominent or were seemingly used for the first time during 1951 and 1952. Dates within the parentheses following a word or definition indicate the first recorded use of the new word or meaning in the files of the committee.

A hyphen preceding the date means that the word or meaning is suspected of being older than the date given. If no date is given, the first record on file is 1952.

ADC. Air Defense Command.

air-watcher, n. One whose job is to search the sky for suspicious and unknown aeroplanes.

ANZUS, n. & adj. Australia, New Zealand and the United States.

Asiad, n. An athletic competition in Asia. (1951)

astragator, n. An interplanetary space traveller.

ATA. Short for the chemical aurin tricarboxylic acid, an antidote to beryllium poisoning. (1951)

atomic calendar. See radio-carbon calendar.

bafflegab, n. Wordiness and lack of clarity in federal communications; gobbledygook.

bamboo curtain. The "iron curtain" of Communist China. (1948)

Bevanism, n. Adherence to the program advanced by Aneurin Bevan, British Labour politician, which includes curtailment of rearmament, full continuance of social services, price freeze, capital levy and restriction of company profits. (1951)

Big R. Nickname for the rotation system of U.S. soldiers in Korea. (1951)

biopic, n. A biographical film. (1951)

brain-changing, n. A procedure used in some totalitarian countries in which such nonviolent means as drugs and hypnosis are employed to make

Estimated World Wool Production

(greasy shorn pounds)

Country	1952	1951
Australia	1,100,000,000	1,080,000,000

an individual forget his past and to accept instead other ideas which those in power wish him to recall. (1951)

bugout, *n.* Rapid evacuation. (1950)

casual, *n.* 1. A personal essay. (1948) 2. A short story. (1951)

chogie, *n.* *Slang.* Term used by U.S. soldiers in Korea for a landmark, such as a hill.

clanks, *n. pl.* Jitters, nervousness. (1943)

controlism, *n.* The condition obtaining when the government exercises control over the economic life of a country. (1951)

cool jazz. A subtle, relaxed type of bebop music popular in 1951-52. (-1952)

Corporal E. A surface-to-surface guided missile. (1951)

crash job. A job calling for the greatest possible speed in its accomplishment.

creepie-peepie, *n.* A walkie-lookie (*q.v.*).

creeping, *adj.* Advancing by slow, hardly noticeable, yet inexorable degrees. (1942)

cronyism, *n.* The use of cronies in government work; the appointment of cronies. (1950)

deep-freeze, *v.t.* *Basketball.* To keep possession of the ball to maintain a lead by preventing an opponent from scoring. **deep-freeze**, *n.* (1948)

delist, *v.* Remove from an approved list. (1947) **delisting**, *n.* (1951)

Dilastrain, *n.* A machine for determining the fatigue of plastics and metals. (1951)

downgrade, *v.t.* To reduce, decrease, lessen. (1948)

drag, *v.* To drag one's feet. *Slang.* To delay, hinder; be reluctant. (1946) *cf.* Farmer and Henley, *Slang and Its Analogues* (1891), *s.v.* *drag*: to put on the drag (colloq.), "To ease off or go slow."

drugfastness, *n.* Immunity to a drug. (1946)

enspherement, *n.* Surrounding an enemy by transporting troops by helicopter to strategic points. (1951)

episode picture. A sequence of unrelated stories filmed under one title.

Federated Fund. An agency for the handling of various charitable contributions.

flighthouse, *n.* A ship with a fixed position, which sends out directional radio beams for aircraft. (1951)

fluid camera. A continually moving camera that follows a character and shows in detail his physical and mental conflicts. (1951)

flyaway kit. A kit which holds a 30-day supply of aeroplane parts. (1951)

Flying Boom. 1. A system of refuelling aeroplanes in flight. 2. An aeroplane used for refuelling. (1951) 3. The device connecting the tanker plane and the aeroplane to be refuelled. (1949)

Formosa Firster. A U.S. advocate of the policy of continuing to support, financially, diplomatically and militarily, the regime of Generalissimo Chiang Kai-shek. (1951)

globalist, *n.* A person who believes in the distribution of U.S. troops in various parts of the globe in defense against communism. (1951) An internationalist. **globalism**, *n.* (1943)

great debate. A widespread discussion of an important issue, especially one with sharp divisions. (1951)

groupment, *n.* A national military unit of 13,000 men.

hackie, *n.* A taxi driver. (1949)

hot rod. *Slang.* A person interested in the making and use of a "souped-up" jalopy (hot rod). (1951) **hot rodder**. (1949)

infrastructure, *n.* The total of structures within a nation or a group of nations necessary to support an army. (1950)

intoximeter, *n.* An apparatus for determining the alcoholic content of a person's breath. (1947)

isoniazid, *n.* Short for isonicotinic acid (hydrazide).

isonicotinic acid (hydrazide). An antituberculosis drug in an experimental stage.

jacketism, *n.* A book-jacket cliché. (1951)

J factor. A blood factor discovered in the serum of a Mrs. Jarrel, which it was believed might contribute to existing knowledge of cancer. (1951)

job-hopping. Shifting jobs so as to put a higher valuation on one's services.

jobineer, *n.* One who plans jobs.

Jodie, *n.* Name applied by U.S. soldiers to an imaginary civilian who flirts with their girls during their absence. (1945)

Krilium, *n.* Trademark of a light yellow synthetic powder (a polymer of polyacrylonitrile) which can build up exhausted and poor soil.

Like-Ike, *n.* (I like Ike) A supporter of Gen. Dwight D. Eisenhower. **Like-Iker**, *n.*

lupulon, *n.* An antibiotic derived from hops (*humulus lupulus*). (-1949)

Manchurian fever. An Asiatic malady whose symptoms include diarrhoea, headache, fever, chills and haemorrhages. (1951)

Marxoid, *adj.* Marxist. (1946) **Marxoidal**, *n.*

megook, *n.* Korean name for a U.S. soldier. (1951)

me-tooer, *n.* One who echoes another's views. (-1949)

miniaturization, *n.* The technique of reducing the size of equipment, especially necessary in electronics. (1949)

neobacin, *n.* A drug that combines neomycin and bacitracin, useful in ointments and in the treatment of intestinal infections. (1951)

out-compete, *v.t.* To be superior to another in competition. (1951)

panelist, *n.* A member of a discussion panel.

panty raid. A raid on a women's dormitory by male students for the purpose of obtaining panties. **panty raider**.

PAR, *n.* Initials of the national organization, Project-Adequate Roads.

paradrop, *v.t.* Drop by parachute. **para-drop**, *n.* (1950)

PAT, *n.* *Foosball.* Point after touchdown. (1949)

payvision, *n.* Subscription television. (1951)

peepie-creepie, *n.* A walkie-lookie (*q.v.*).

Pentagonese, *n.* Language of the Pentagon, *z.e.*, of the top military.

Pentagonia, *n.* Personnel of the Pentagon. (1951) **Pentagonian**, *n.* A worker in the Pentagon. (1950)

photobiography, *n.* A series of photographs covering the life of a person. (1944)

pigeonhole-parking, *n.* The parking of automobiles in tiers. (1947)

pony tail. A woman's hair-do, stylish in 1951-52. (1951)

poodle cut. A woman's hair-do, stylish in 1951-52. (1951)

printed circuit. An electrical circuit made by lithographing a thin line of metallic paint on an insulated base. (1950) **printed wire**. (1946)

profit foul. *Basketball.* A foul made intentionally to prevent the opposing side from scoring by normal throwing.

progressive strike. A labour strike that (1) adopts the hit-and-run technique or (2) progresses across the country or from company to company. (1949)

psycholinguistics, *n.* The study of the psychological problems of language. (1946)

PVP. Short for polyvinyl pyrrolidone, a synthetic blood substitute developed by I. G. Farben. (1951)

pyromen, *n.* A drug being used experimentally in infantile paralysis. (1950)

radar wall. A series of radar stations whose purpose is to detect enemies. Also called **radar fence**. (1948)

radio-carbon calendar. A sensitive device utilizing a Geiger counter, which can determine the age of substances up to 30,000 years. Also called **atomic calendar**. (1951)

R & R. Rest and recreation for U.S. soldiers in Korea. (1951)

rotatee, *n.* A U.S. soldier on rotation leave.

Saceur. Supreme Allied Commander, Europe. (1951)

Saclant. Supreme Allied Commander, Atlantic.

sciencer, *n.* A science-fiction film.

shadow town. A substitute, refuge town, to be used in time of war.

SHAPE. Supreme Headquarters, Allied Powers Europe. (1950)

shouldercade, *n.* A procession of people carrying someone on their shoulders. (1951)

sky tunnel. A designated air lane within which aeroplanes operate. (1951)

snidery, *n.* Hypocrisy, pretense.

space platform. A platform which would revolve about the earth and serve as a base for further travel into space. (1951) Also called **space station**. (1947)

SSN. Short for Submarine Nuclear, an atomic submarine. (1951)

stay-down strike. 1. A strike of miners who protest by remaining in the mine. (1948) 2. A strike of pilots who in 1952 refused to accept flying assignments.

STR. Submarine thermal reactor.

stretch-out, *n.* In the defense program, a slowing down of production by extending the period for meeting quotas; system or sequence of delays. **stretch out**, *v.*

strokelet, *n.* A minor paralytic stroke.

taxi radar. A unit for airport traffic control that extends the range of the operator.

Telecue, *n.* A Teleprompter (*q.v.*). (1951)

Teleprompter, *n.* An electronic device, in front of a speaker and visible to him but hidden from the audience, which unrolls his prepared speech, printed in large letters, as he needs it. (-1951)

telethon, n. (television+marathon) An extended television show for the purpose of raising money for some cause. (1949)

trafficator, n. Brit. An indicator on an automobile to show that the driver is going to turn. (-1951)

uranium curtain. An alleged policy of exclusion by the United States of European scientists. (1946)

walkie-lookie, n. A television hand-camera. (1946)

weedicide, n. A weed killer. (1946)

whirlybird, n. A helicopter. (1951)

zip gun. A powerful, home-made pistol. (1950)

Zoomar (lens). The trademark of a lens of such flexibility that, for example, it can make its image large or small as required. (1947)

(I. W. R.)

World Assembly for Moral Re-Armament.

More than 10,000 political and industrial leaders from America, Europe, Asia and Africa took part in the World Assembly for Moral Re-Armament in 1952. Seventy thousand people from 118 nations, including the elected leaders of 60,000,000 organized workers, had attended these assemblies since World War II.

At the turn of the year at Caux, Switz., the European headquarters of Moral Re-Armament, the leaders of Asian and middle eastern countries met with European industrial and trade union heads. In January, Miami, Fla., provided the setting for a conference of the Americas. Nineteen South American countries were represented. In June the World Assembly for Moral Re-Armament of the Nations took place at the Grand hotel, Mackinac Island, Mich., with 1,371 selected representatives of the industrial leadership of America, Europe and Asia participating. The chairmen of the U.S. senate and house foreign relations committees sent invitations to leading political figures in Europe, Africa and Asia.

The 1952 World Assembly for Moral Re-Armament at Caux was convened at the urgent request of industrial and political leaders "to demonstrate a basis for world unity, and an answer to the present political and economic crisis." Senator Alexander Wiley of Wisconsin, visiting the assembly with the senate subcommittee on escapees and refugees, reported "Ideas are working there. French and Germans are coming together. Communists are being changed. Management and labour are uniting."

European cabinet ministers, including the chairman of the North Atlantic Treaty organization, Ole Bjørn Kraft, and the west German minister for upper house affairs, Heinrich Hellwege, met at Caux to discuss a basis for European integration and especially of Franco-German understanding. They emphasized the need for an ideological basis for the unity of the west.

The ideological approach to the special problems facing industry was discussed in special industrial conferences at the World Assembly convened by European industrial leaders. *The Times* (London) emphasized the "paramount importance" placed on "the spreading of a democratic way of life that would challenge the advance of materialism and win the allegiance of millions behind the iron curtain," and "an ideology which safeguarded the moral values on which our democratic society is based"

A notable feature of the world assembly was the participation of the leaders of Africa and Asia. In response to invitations from six far eastern countries, Frank Buchman took a task force of Moral Re-Armament to Asia at the close of the conference. The prime ministers of Burma and Thailand sent special representatives to the assembly. The prime minister of Thailand summarized their convictions: "No country can survive long in these days of ideological upheaval without the practice of Moral Re-Armament principles which belong to East and West alike and to which all peoples of all races and creeds can subscribe. We shall find through Moral Re-Armament the basis of unity for South East Asia." African leaders from East, South

and West Africa stressed the significance of an ideology above race, class and colour in uniting the various elements in Africa.

World Council of Churches: see CHRISTIAN UNITY; RELIGION.

World Health Organization. The World Health organization became a specialized agency of the United Nations on Sept. 1, 1948, when 26 countries had ratified its constitution, and by 1952 comprised 79 full member states and three associate members. From the outset, the World Health assembly, the supreme legislative organ of W.H.O., which meets annually to approve the program and budget, defined six major health problems on which the efforts of the organization were to be concentrated.

As a result, W.H.O.-assisted malaria control projects operated in 20 countries during 1952 (Afghanistan, Burma, Cambodia, Dominican Republic, Formosa, French Cameroun, Haiti, India, Indonesia, Iran, Iraq, Lebanon, Liberia, Paraguay, Philippines, Sarawak, Saudi Arabia, Syria, Vietnam and Windward Islands). For the control of tuberculosis, demonstration and training centres were operating in Ecuador, El Salvador, Jamaica, Pakistan, Turkey, Burma, Ceylon, India and Thailand in 1952, while new projects were started in Egypt, Syria, India and Indonesia. In close association with these, wherever possible, mass vaccination programs with BCG (Bacillus-Calmette Guérin) were carried out in 18 countries, with the assistance of U.N.I.C.E.F. (the United Nations International Children's Emergency Fund). In the field of venereal diseases and treponematoses, control programs by means of penicillin treatment, assisted by W.H.O., were operating during the year in Haiti, Thailand, Indonesia, the Philippines, India, Laos, Liberia, Iraq and Yugoslavia. In the six larger mass campaigns against nonvenereal treponematoses (yaws, bejel, pinta) about 6,000,000 persons were examined and 2,000,000 treated with penicillin from the inception of the programs until the middle of 1952.

Maternal and child health projects launched with the assistance of W.H.O. and, in many cases, with supplies from U.N.I.C.E.F., included the creation of the first children's hospital in Bolivia, as well as demonstration and training centres in Afghanistan, India, Burma, Thailand, Cambodia, Japan, Brazil, Colombia, Chile, Peru, Paraguay, Pakistan, Lebanon and Syria. Ten European countries, as well as Lebanon and Japan, received assistance during 1952 in the rehabilitation of physically handicapped children or the care of premature infants.

Recognizing the part played by environmental sanitation problems in the spread of communicable diseases, W.H.O. attached sanitary engineers and other experts in hygiene to many of the disease control demonstration teams in the field and organized seminars for sanitary engineers (London and Nicaragua, 1952).

While maintaining its frontal attack on these and other specific health problems, experience gained since 1948 led W.H.O. to make a change of emphasis in the method of approach. As stated by the director-general, Brock Chisholm (Canada), the objective of W.H.O. can best be attained by "assisting public health administrations (of member states) to take the next appropriate step in their development." This change of emphasis was reflected during 1952 by the appointment of public health advisers to serve at government level (four of these were requested by governments in 1952) and by an increase in the number of public health experts appointed to W.H.O. regional offices. The public health officers at regional offices assist local

public health administrators in drawing up balanced national programs of public health and advise what form W.H.O. assistance to individual countries should take. Regional committees, meeting once a year, forward proposals for inclusion in the overall program and budget of W.H.O. to the 18-member executive board. This is finally scrutinized and adopted by the annual World Health assembly held at Geneva (the W.H.O. regular budget for 1952 was \$7,700,000). (M. S. W.)

Wrestling. An armed forces squad, assembled and coached by Ray Swartz of the United States naval academy, captured the team trophy in the 62nd annual championships of the Amateur Athletic union at Cornell university, Ithaca, N.Y., April 3-5, 1952. Henry Wittenberg, New York city policeman who had been out of competition four years, returned to action and set an A.A.U. record by winning in the 191-lb. class for his eighth title. Later in the month, Wittenberg met his first setback after a string of almost 400 triumphs in amateur wrestling when he suffered an injury and lost to Dale Thomas of Marion, Ia., in the fifth round of the Olympic trials.

Other A.A.U. title winners were Sidney Nodland, Long Island Grapplers, 114.5 lb.; Jack Blubaugh, armed forces, 125.5; Josiah Henson, armed forces, 136.5; Newt Copple, Champaign, Ill., 147.5; James La Rock, New York Athletic club, 160.5; C. Shuford Swift, armed forces, 174; and Lt. Richard Clark, unattached, Rome (N.Y.) Air base, heavyweight.

Oklahoma matmen retained the team crown in the National Collegiate Athletic association tourney at Fort Collins, Colo., scoring 22 points to edge the powerful Iowa State Teachers, who tallied 21. Individual champions were: Hugh Perry, Pittsburgh, 115; Billy Borders, Oklahoma, 123; Gene Lybbert, Iowa Teachers, 130; George Layman, Oklahoma A. and M., 137; Tom Evans, Oklahoma, 147; Bill Weick, Iowa Teachers, 157; Joe Lemyre, Penn State, 167; Bentley Lyon, California, 177; Harry Lanzi, Toledo, 191; and Gene Nicks, Oklahoma A. and M., heavyweight.

Penn State, with Richard Lemyre, Joe Lemyre and Robert Homan taking individual titles, retained its team championship of the Eastern Intercollegiate Wrestling association. (See also OLYMPIC GAMES.) (T. V. H.)

Wyoming. A Rocky mountain state of the United States, Wyoming was admitted to the union on July 10, 1890, as the 44th state. The name of the state, which means "mountains and valleys alternating," was derived from the Wyoming valley in Pennsylvania. Because of its pioneer work in woman's suffrage, Wyoming became popularly known as the "Equality state."

Wyoming ranks 8th in size and 47th in population among the states. The land area is 97,506 sq.mi.; water area, 408 sq.mi. The 1950 census, which gave a total population of 290,529, a 15.9% increase from 1940, listed rural inhabitants at 145,911 or 50.2% of the population of the state and urban at 144,618, or 49.8%. The 1940 census gave the population at 250,742 and listed 229,818 native white; 950 Negro; and 17,107 foreign born.

The capital of Wyoming is Cheyenne, with a population (1950 census) of 31,935. Other cities having a population of 10,000 or more were: Casper, 23,673; Laramie, 15,581; Sheridan, 11,500; and Rock Springs, 10,857.

History.—On Aug. 2, 1952, Boysen dam, a 1,493,000-ac.ft. capacity storage dam, was dedicated. This dam, located on the Big Horn river near Thermopolis, Wyo., would provide 73,000,000 kw.hr. of power per year. Under construction for more than four years, it cost an estimated \$34,321,000.

State officials during 1952 were: governor, Frank A. Barrett; secretary of state, C. J. Rogers; state auditor, Everett T. Copen-

haver; state treasurer, Minnie A. Mitchell, who was appointed to succeed her husband, J. R. Mitchell, deceased; superintendent of public instruction, Edna B. Stolt.

Education.—In 1950-51 there were 588 elementary and rural schools in Wyoming, with 1,243 elementary teachers and 506 rural teachers and a total enrolment of 47,146. There were 89 accredited high schools with 893 teachers, and an enrolment of 14,062. State expenditures for education in 1950-51 were approximately \$16,382,931. A total of 228 school administrators were employed in the state during this period.

Social Insurance and Assistance, Public Welfare and Related Programs.—Funds spent on public welfare for the period Jan. 1, 1952, to Sept. 30, 1952, were as follows: old-age assistance \$2,131,698; aid to dependent children \$501,811; aid to the blind \$47,492; general welfare \$154,166; child welfare \$27,392; general welfare health \$245,108; aid to the permanently and totally disabled \$227,359.

There were 3 correctional institutions with 412 inmates and appropriations (for period April 1, 1951, to March 31, 1953) as follows: state penitentiary at Rawlins, 337 inmates, appropriations \$434,870, capital outlay \$10,000; girls' school at Sheridan, 30 inmates, appropriation \$189,300, capital outlay \$20,264; boys' school at Worland, 45 inmates, appropriation \$222,575, capital outlay \$8,000.

A home and hospital for the aged, the only state-owned and state-operated home of this type in the United States, was operating with a great deal of success. It was built at a cost of about \$600,000 and accommodated 70 members and staff, with additional hospital facilities for 20 persons. The appropriation for the period April 1, 1951, to March 31, 1953, was \$150,000.

Communications.—During the period Oct. 1, 1951, to Sept. 30, 1952, the Wyoming highway department let approximately 94 contracts for a total expenditure of \$9,918,862, of which 27 contracts for an amount of \$1,346,957 were for special maintenance work and 40 contracts amounting to \$1,413,078 were for state-county co-operative projects. This work was spread over a total mileage of 635,000. The highway system in Wyoming consisted of 4,734 mi., of which 1,330 mi. were secondary routes. The maintenance budget for the period Oct. 1, 1951, to Sept. 30, 1952, was set at \$2,475,000. Railroad mileage was 3,473.4. There were 36 major airports in the state and 76 flying farmer and private strips. Eight federal airways totalled 1,380 mi. There were 80,828 telephones.

Banking and Finance.—On June 30, 1951, there were 29 state banks with deposits of \$74,520,740.94 and resources of \$80,712,069.81. There were 24 national banks with deposits of \$175,503,791.18 and resources of \$187,954,559.41. There were 10 savings and loan companies with total resources of \$20,939,867. Total state receipts for the fiscal year ended Sept. 30, 1951, were \$50,190,271.33. Total disbursements for the same period were \$41,542,134.03. The bonded debt for the state on Sept. 30, 1951, was \$4,558,000.

Agriculture.—The total acreage harvested in 1952 was 1,986,000. Cash income from crops and livestock in 1950 was \$146,285,000. There were no heavy rains or snows which had an unusual effect on crops in 1952. Yields of small grains were reduced by the hot, dry weather occurring the first three weeks of June. This period in June was the driest since 1879.

Manufacturing.—According to the 1947 industrial census, the total estimated value added by manufactures was \$34,957,000. The total employment at this time was 4,285, with total wages paid amounting to \$12,291,000.

Employment.—The total labour force in Wyoming, as estimated for May

Table I.—Principal Crops of Wyoming

	Indicated 1952	1951	Average 1941-50
Corn, bu.	918,000	780,000	1,290,000
All wheat, bu.	6,800,000	6,750,000	5,468,000
Oats, bu.	4,470,000	4,694,000	4,395,000
Barley, bu.	4,140,000	4,587,000	3,962,000
All hay, tons.	1,288,000	1,255,000	1,235,000
Dry, edible beans, cwt.	783,000	728,000	1,151,000
Sugar beets, tons.	476,000	438,000	395,000
Potatoes, bu.	1,672,000	1,202,000	2,035,000

Table II.—Number and Value of Livestock in Wyoming

	Number on farms and ranches Jan. 1, 1952	Value
Cattle	1,124,000	\$216,932,000
Hogs and pigs.	78,000	2,153,000
Stock sheep	2,049,000	73,411,000
Sheep and lambs on feed	71,000	2,160,000
Horses	72,000	35,000
Mules	1,000	1,074,000
Chickens	741,000	126,000
Turkeys	18,000	

Table III.—Mineral Production of Wyoming

(Short tons, except as noted)					
Mineral	Quantity	Value	Quantity	Value	
Clays	413,000	\$ 4,102,000	370,000	\$ 3,567,000	
Coal	6,348,000	24,049,000	6,001,000	22,972,000	
Iron ore	550,000		604,000		
Natural gas (000 cu. ft.)	62,062,000	3,724,000	50,815,000	2,820,000	
Natural gasoline (gal.)	1,058,000	3,382,000	926,000	3,248,000	
Petroleum (bbl.)	61,631,000	133,120,000	47,890,000	109,190,000	
Petroleum gases (gal.)	493,000	934,000	379,000	842,000	
Sand and gravel	1,938,000	1,251,000	2,352,000	1,913,000	
Stone	1,841,000	2,214,000	1,803,000	2,227,000	
Other minerals		4,801,000		4,219,000	
Total		\$177,577,000		\$150,998,000	

*Value included with other minerals.

1952, was about 123,100 workers, of whom about 59,600 were covered by unemployment compensation. Of the total labour force, approximately 27,000 persons were employed in agriculture, 9,700 in mining, 6,800 in contract construction, 6,300 in manufacturing, 13,100 in all types of transportation, 2,700 in utilities and communications, 2,300 in wholesale trade, 14,100 in retail trade, 2,100 in finance and real estate, 10,700 in the services, 2,100 in professions, 16,200 in all types of government, 2,000 in miscellaneous, 6,000 were self-employed and 2,000 were unemployed. (F. A. Bt.)

Mineral Production.—Table IV shows the tonnage and value of mineral commodities produced in Wyoming in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Wyoming ranks 16th among the states in value of mineral output, with 1.50% of the U.S. total.

X-Ray and Radiology. An outstanding technical development of 1952, described by Russell H. Morgan and Ralph E. Sturm of Johns Hopkins university, Baltimore, Md., was a practical apparatus which increased the level of brightness of the images on a conventional fluoroscopic screen by a factor of between 300 and 1,000 when used in examination of the thorax, and between 1,000 and 3,000 when used in examination of abdominal organs. Intensification of luminosity of such magnitude brought the image well within the limits of cone vision, making it visible without recourse to time-consuming and inconvenient adaptation of the eyes of the examiner to darkness. It was therefore possible to reduce the intensity of X-rays used in fluoroscopy to remarkably low levels and hence relatively safe levels for both the examiner and the subject. Thus longer periods of observation became possible, and the marked increase in brightness was expected to advance immeasurably the development of cinerointerferography. In the early stages of development the field intensified was small; the apparatus was somewhat cumbersome, bulky and expensive to produce; therefore, widespread clinical applications of the apparatus were not immediately foreseeable. Applications for teaching and demonstration work were, however, obvious.

Laurence L. Robbins and Edwin H. Land described the application of Land's one-step dry photographic processing to clinical diagnostic radiology. The operation of this process had become generally familiar through the widespread use of the Land polaroid camera, with which prints of photographs were made available within a minute or so after exposure had been made. In roentgenography, two photosensitive sheets were used: a negative one which carried an emulsion sensitive to light, and a positive one on which the positive roentgenogram was produced. The developing chemicals, in the form of a thick jelly, were contained in a capsule which was attached to an edge of the positive sheet. A special holder for this pack was equipped with rollers which applied pressure on the pack as it was withdrawn. The pressure broke the capsule, the developing jelly spread over the sheet and within one minute a dry positive roentgenogram was ready for inspection with no more labour than was necessary to extract the sheet from the pack. The diagnostic quality of the X-ray produced was remarkably good, although the dimensions of film available were only 23 by 23 cm., useful chiefly for examinations of the skull and extremities. The film and special containers were still restricted to military use, where the advantages of easy transport, daylight loading and rapid processing were obvious, especially in the field. It was expected that when the process was made available for civilian use, the chief value of the system would be in operating rooms and in emergency work.

Noted during the year were several new procedures for advancing the study of the circulation of the blood during life by extending angiographic principles to the venous system of the spleen and liver, the large venous channels of the cranium and to the large arterial channels of the abdomen, the abdominal aorta and its branches to the kidneys, spleen and other abdominal organs. Not only were abnormalities of the vessels discovered in this way, but certain abnormalities of the organs sup-

plied with, or drained of, blood by these vessels became apparent, more advantageously, it was hoped, than by any other diagnostic manoeuvre formerly used. In most of these investigations the general intention was to produce a selective opacification to X-rays of a single vessel or system of vessels, to the exclusion of others. For instance, A. M. Rappaport of the University of Toronto, Ont., studied the veins of the liver. His approach to these veins was by inserting a flexible catheter into one of the large veins (the saphenous) of a dog and manipulating its tip under the fluoroscope into the mouth of the vein he wished to inject. He then injected a solution of iodopyracet (diodrast), a complex chemical compound containing iodine, into this vein and succeeded in getting X-rays of this vessel and of the liver substance into which this vessel and its tributaries flowed. L. Leger and a group of associates in Paris, Fr., George E. Moore and R. B. Bridenbaugh of the University of Minnesota, Minneapolis, and Charles G. Childs III and a group of associates of the New York hospital-Cornell Medical centre directed efforts along similar lines in animals and in man, but injected the opacifying solution directly into the portal vein as it was exposed during various surgical operations in the abdomen. They too were able in this way to project the injected vessels and various portions of the liver on X-ray film showing structural abnormalities of the vessels as well as certain pathologic changes, such as tumours and cirrhosis in the substance of the liver.

A safe and satisfactory method of projecting the liver, the spleen, the pancreas, the adrenal glands and the substance of the kidney on X-ray film was still unknown. Howard R. Bierman, Earl R. Miller and a group of associates at the University of California medical school, Berkeley, searching for a clinical method by which the blood supply of specific abdominal organs could be projected on X-ray film, were successful in introducing long, flexible catheters into large arteries of the extremities and neck, guiding them with the fluoroscope to the aorta, thence into the smaller arteries practically anywhere in the body. In this way they were able to make the selective injections more or less as they wished, thus projecting the vessel and the organ selected on X-ray film, possibly even administering medication directly to the organ in certain situations. It was a daring approach, and it proved to be somewhat hazardous, even fatal in a few of their subjects. The method was clearly still in the experimental stage, but logical and promising.

In therapeutic radiology, the greatest interest and new work remained in the development and clinical applications of high-energy radiation from various sources such as multimillion-volt X-ray generators, betatrons, multicurie cobalt 60 and 50-gm. radium teletherapy units. These were known as supervoltage units, and while some types were increasing slowly in number, they were very expensive to procure and maintain. The literature of the year concerning these high-energy radiation units dealt largely with technique of therapy, construction problems, measurements of dosage and the immediate results of treatment. Predictions about a more favourable outlook for the patient afflicted with malignant disease were in general guarded and restrained. Apparently most of the experts in radiation therapy felt that these methods of delivering radiation of the higher-energy levels would probably not produce a much more favourable long-term outlook for the patient with cancer. It would be anticipated, however, that the best results obtained with units generally available would be maintained, but with substantial reduction in the untoward complications and unfavourable sequelae of quantities and intensities of radiation delivered by units of more moderate capacities. Yachting. In a year of unprecedented activity in all departments of yachting, from ocean racing to dinghy sailing, Richard S. Nye's 46-ft. over-all yawl "Carina," from Greenwich, Conn., ranked as one of the outstanding boats of 1952 by virtue of winning the Bermuda trophy in the year's most important ocean race. To this "Carina" added, against top-rate competition, victory in class AI of the Off Soundings club cruise and class A of the Riverside-Stratford Shoal race; first place in the City Island-Cornfield Lightship race; the Navy Alumni Challenge cup on the New York Yacht club cruise; the Metcalf trophy on the Indian Harbor Yacht club cruise; and third place in the Stamford-Vineyard race.

In the Bermuda race, with "Carina" taking fleet and class C honours, the U.S. naval academy's big yawl "Royono," Lieut. Frank Siatkowski commanding, was first to finish and class A corrected time winner, and Roderick Stephens, Jr., sailing "Mustang," again won class B.

Another outstanding ocean racer, Carleton Mitchell's yawl "Caribbee," from Annapolis, Md., won the Florida Governor's trophy with a clean sweep of the three major distance races of the southern circuit—the Ft. Lauderdale-Cat Cay, Miami-Nassau and St. Petersburg-Havana races. Later in the summer "Caribbee" was first to finish the transatlantic race from Ber-

muda to England, though beaten on corrected time by the little (31-ft. over all) "Samuel Pepys," sailed by Lieut. Com. Erroll Bruce, R.N. In four subsequent starts in British waters, "Caribbee" won three first prizes, including the New York Yacht club Challenge cup in a race around the Isle of Wight.

On the Great Lakes, winners in the Pt. Huron-Mackinac race were Paul Smiley's class A sloop "Orient," fleet winner; Elmer Doyle's sloop "Sashay," class B, and Nicholas Gieb's ketch "Fleetwood," class C. "Fleetwood" also took division II in the Chicago-Mackinac race, in which "Tahuna," P. C. McNulty, won in division I. "Escapade," Wendell Anderson, won the Rochester Yacht club's race around Lake Ontario for the second year in a row. On the east coast DeCoursey Fales's veteran schooner "Nina" won the Stamford-Vineyard race for the third time in 12 years, and Gilbert Verney's new yawl "Sea Lion" won the Storm Trysail club's Block Island race.

West coast ocean racing started May 1 with 133 sail in the annual Newport Harbor, Calif.-Ensenada, Mex., race. Barney Huber's class C sloop "Mara" was a repeat winner in the Ensenada race in the Ocean Racing Rule group, while Orin Thorildsen's "Moonbeam" won the Arbitrary Handicap division. Other west coast winners included "Buoyant Girl," Harold Rosenblum, in the Farallone Islands race; "Maruffa," Jack Graham, Protection Island race; "Rebel," Douglas Sherwood, Vashon Island race; and "Ono," Herbert Day, Swiftsure race. C. P. Paschall's cutter "Revenge" won the Puget Sound Tri-Island series.

One of the big events in closed course racing was the Olympiad in Finland in which five classes competed, with U.S. yachts taking two first places and one second place. (See OLYMPIC GAMES.)

The North American Yacht Racing union held its first national senior sailing championship, in which 21 of the union's 23 member associations competed through a series of eliminations leading up to the eight-crew finals in September at Mystic Seaport, Conn., where Cornelius Shields, veteran Long Island sound skipper, emerged as the first national champion. Patricia Hinman's Manhasset Bay (L.I.) Yacht club crew took the women's national title and Martin Purcell's Indian Harbor (Conn.) Yacht club crew the junior nationals. The national intercollegiate sailing crown went to Harvard, with Charles Hoppin and James Nathanson as its skippers.

The New York Yacht club cruise brought out its largest fleet in several years, 52 sail. John Matthews' 12-m. sloop "Vim" won the King's and Astor cups, James Brickell's sloop "Starlight" the Una cup and William Ziegler, Jr.'s schooner "Bounding Home" the Cygnet cup. At the Eastern Yacht club of Marblehead, Mass., Frank C. Paine's sloop "Gypsy" won the Puritan cup and Hovey Challenge bowl, and Robert Coulson's "Finn MacCumhaill" the Commodore's and Vice-Commodore's cups.

Of the many national and international class champions crowned during 1952 one of the outstanding was Agustino Straulino, whose "Merope" won the Olympic, European and world championships for Italy. Among other skippers who took top titles in the big one-design classes were: Lightnings—Robert Graf, Buffalo, N.Y.; Comets—Phil Somervell, Riverton, N.J.; Snipes—Ted Wells, Wichita, Kan. (third time); 210s—Philip Benson, Cohasset, Mass.; Penguins—Runyon Colie, Mantoloking, N.J. (fifth time); Thistles—James Hendricksen, Sandusky, O.; 110s—Bob Mann, San Diego, Calif.; Wood Pussies—E. King Graves, Jr., Cold Spring Harbor, L.I.; L-16s—Victor Coudert, Jr., Greenwich, Conn.; Moths—(Internationals) Clai-bourne Coupland, Norfolk, Va. and (Nationals) Randall Swan, Jr., Charleston, S.C. (W. H. Tr.)

Yellow Fever: see TROPICAL DISEASES.

Yemen. An independent state in the southwestern tip of the Arabian peninsula, Yemen lies between Saudi Arabia, Aden protectorate and the Red sea. Area: *c.* 31,000 sq.mi. Pop. (1951 est.): 1,600,000. Language: Arabic. Religion: Moslem. Capital: San'a (est. pop. 25,000). Ruler: Sayf al-Islam Ahmad ibn Yahya.

History.—In April 1952 the sultan of Lahej in the northern part of Aden protectorate fled across the border into the Yemen where he was given political asylum. He had ignored a request from the Aden government to attend an inquiry into the death of two of his cousins, the Emir Hassan Ali and the Emir Ahmed Mehdi, and to enforce its demands the Aden government had sent a military force to occupy the town of Lahej. This provoked a statement of "complete surprise and astonishment" by the Yemeni legation in London which at the time was discussing recent developments in the Lahej sultanate with the British foreign office. It expressed the view that measures taken by the Aden authorities should conform to the letter and spirit of existing treaties and that developments would be watched with close concern in the Yemen.

In May a treaty of friendship between Spain and the Yemen was signed at the Spanish embassy in Cairo, providing for diplomatic and cultural relations between the two countries.

(O. M. T.)

Finance.—Monetary unit: Maria Theresa dollar, called the riyal, nominally equal to 1 Indian rupee with an exchange rate of 13.33 riyals to the pound and 4.76 riyals to the U.S. dollar.

Foreign Trade.—Trade with the U.K. (1950): imports £4,657, exports £801. Trade with the U.S. (1950): imports \$62,674; exports \$2,273.-982. Main imports from the U.S.: machinery, cars and accessories, etc. Main exports to the U.S.: cocoa, coffee and tea, hides and skins, petroleum and products.

Agriculture.—Main crops: wheat, barley, millet and coffee.

Young Women's Christian Association: *see* SOCIETIES AND ASSOCIATIONS, U.S.

Yugoslavia. A federal people's republic of southeastern Europe, Yugoslavia is bounded north by Austria, north and northeast by Hungary and Rumania, east by Bulgaria, south by Greece and west by Albania, the Adriatic sea and Italy. Area: 99,181 sq.mi. Pop.: (1948 census) 15,772,107; (Dec. 1951 est.) 16,441,000. The federal republics include:

	Population (1948)	Capital
Serbia*	6,527,969	Belgrade (389,114)
Croatia	3,756,807	Zagreb (290,667)
Slovenia	1,391,873	Ljubljana (121,050)
Bosnia and Hercegovina	2,565,283	Sarajevo (118,806)
Macedonia	1,152,986	Skopje (91,491)
Crnagora (Montenegro)	377,189	Titograd (12,272)

*Including the autonomous province of Vojvodina (pop., 1,663,216) and the autonomous region of Kosovo-Metohija (pop., 727,820).

Other towns (pop., 1948 census): Subotica (112,530); Novi Sad (77,713); Rijeka, formerly Fiume (72,928). Language: Serbo-Croat, Slovene and Macedonian; Albanian, Hungarian, Turkish, Rumanian, Italian, Bulgarian and German spoken by minorities. Religion (1948 est.): Greek Orthodox 45%, Roman Catholic 32%, Moslem 11%. President of the presidium of the people's assembly (*Skupstina*): Ivan Ribar; vice-presidents: Mosa Pijade (Serbia), Filip Lakus (Croatia), Josip Rus (Slovenia), Djuro Pucar (Bosnia and Hercegovina), Marko Vujacic (Crnagora) and Dimitar Vlahov (Macedonia); prime minister: Marshal Tito (Josip Brozovich) (*q.v.*).

History.—During 1952 the government made considerable concessions to the peasants. On June 7 it was announced that compulsory deliveries of cereals to the state had been abolished. In speeches at Nis and Glina in July, Marshal Tito stressed that the development of collective farms must depend on local conditions. In the great fertile plains, he maintained, individual

peasant holdings were an obstacle to production: collectivization was the best policy. In areas where conditions of production did not suit collectivization, other forms of co-operation could be devised. In some areas it might even be found that no co-operatives at all were needed. The practical execution of this new and less doctrinaire policy was not yet clear. In some regions collective farms were actually disbanded. Where collective farms were preserved, the situation of their members was made easier. In particular, the collective farm was to pay a rent, varying from 15% to 30% of the value of the land, for land brought into it by member households. Official statements stressed that Yugoslav collective farms were coming to differ more and more from soviet kolkhozes. The abolition of compulsory deliveries was certainly welcome to the peasants. Its effect was reduced however by the high cost of transport and the effective monopoly in the hands of the authorities of all trade in farm produce. In many areas the cost of transport made it difficult for the peasant to take or send his produce to the larger markets. The absence of competition between individual traders for his produce prevented him from making use of a basically favourable economic situation. The government shops were able in effect to dictate prices which, if better than those granted in the days of compulsory deliveries, were still much lower than a genuinely free market would give.

Relations between government and religious communities continued to be uneasy. As before, the Catholic Church was the main target of official denunciations. The hierarchy was accused of sympathy with reactionaries and the Vatican of support to Italian policy. The opposition of the hierarchy to a government scheme for associations of priests, which were to have the same rights of social insurance as workers' and professional associations, also incurred official indignation. Marshal Tito's own views on religion were clearly stated in an interview to university students on March 14. The eradication of religious sentiment, the marshal said, was bound to be a long process, facilitated by political education and economic progress. Meanwhile "we cannot allow our youth to be corrupted under the cloak of religion."

During the year there was much discussion in the official press of a proposed new constitution. In April a law for the reorganization of people's committees (organs of provincial, municipal and local government, originally modelled on the soviets of the 1936 Stalin constitution) was passed by the central parliament. Under this law the committees were to be bicameral. They were to consist of an assembly of citizens, of 20 to 70 members, depending on the size of the locality, and a council of producers, elected by industrial and agricultural workers from economic enterprises and agricultural associations, numbering half as many persons as the assemblies. Instead of departments of local government, there were to be councils of persons elected by the committees. The permanent salaried personnel employed by the departments was to be drastically reduced.

This reform of local government was to be followed by a similar reform of central government. This was discussed at length, but by October had not yet been enacted. The parliament was to remain bicameral. The first chamber, the federal council, would as previously be elected by the population as a whole, by territorial constituencies. The present second chamber, the council of nationalities, would be replaced by a council of producers. The representation of nationalities as such was to be safeguarded by a provision that, when a change in the constitution or a matter affecting the relations between the constituent republics and the central government was under discussion, a special group of deputies should be formed—12 from each republic, 7 from the Vojvodina autonomous province and 4 from the Kosovo-Metohija autonomous region—which should vote

separately from the 2 chambers. The council of producers was to be elected by workers in their enterprises and by agricultural associations. The latter term included not only collective farms but also the looser co-operatives of which individual peasant farmers were members. It seemed probable that the collective farmers were somewhat overrepresented among the agricultural population, and it was certain that the agricultural population as a whole was to be very much underrepresented. Whereas about 70% of the population of Yugoslavia was engaged in agriculture, about 40% of the seats in the council of producers would be granted to peasants.

The cabinet was to be abolished and replaced by a presidium elected from the members of the parliament. The president of the presidium would be both head of state and chief of the government. There could be no doubt that this office was reserved for Marshal Tito. The presidium would set up committees of its members, to deal with foreign affairs, internal affairs, economic and social policy, education and culture. These committees would issue directives to subordinate state secretariats, which would be the executive organs. The aim of these changes was said to be to dissociate political leadership from administrative routine. The presidium would be a policy-planning brain trust, responsible to parliament. The state secretariats, which would be the old ministries under a new name, would carry out orders but would not interfere in policy.

This ambitious constitutional reform must be related to the fact that a monopoly of political power remained in the hands of the Communist party. The effects both of the economic decentralization which took place in 1951 and of the new form of popular representation now being prepared were limited by the continued supremacy of the party. Key posts in factory councils, people's committees and the presidium of the parliament would, as before, be held by members or nominees of the Communist party, although the available evidence suggested that both economic and political administration were in fact being entrusted rather to experts than to the earlier type of party demagogue. But the task of distinguishing between leadership and administration was not easy.

During the year Yugoslav trade with the west continued to be considerable. The largest single client, both for exports and for imports, was the German Federal Republic.

Marshal Tito continued to express his desire for the best relations with the west, but continued to oppose any formal treaty commitments. Relations with Greece and Turkey improved. Tokens were the visit to Yugoslavia of a Greek parliamentary delegation in July and of a group of Turkish journalists in August. The Austrian foreign minister, Karl Gruber, paid an official visit in July. Relations with Italy were still dominated by the conflict over Trieste. During April and May there were demonstrations and agitation against Italy. The Yugoslav press devoted much attention to the Trieste question and to the activities of extreme nationalist groups in Italy.

(See also TRIESTE, THE FREE TERRITORY OF.) (H. S.-W.)

Education.—Schools (1950-51): elementary 13,031, pupils 1,524,987, teachers 26,899; secondary 1,696, pupils 485,876, teachers 14,198; teachers' colleges 75, pupils 27,300, teachers 1,214; technical 1,449, pupils 193,478, teachers 18,690; art, musical and dramatic 142, students 18,426, teachers 1,775; workers' educational colleges 109, pupils 7,837. Institutions of higher education: 88 faculties, academies and high schools, students 60,395, professors and lecturers 5,406. Schools for national minorities (1950-51; including Albanian in parentheses): elementary 1,502 (830), secondary 251 (89), teachers' colleges 10 (3).

Finance and Banking.—Budget: (1951) balanced at 172,662,000,000 dinars. Currency circulation (June 1952): 40,150,000,000 dinars. Bank deposits (June 1952): 126,330,000,000 dinars. Monetary unit: dinar with an official exchange rate of 840 dinars to the pound and 300 dinars to the U.S. dollar.

Foreign Trade.—(1950) Imports 11,784,000,000 dinars, exports 7,932,000,000 dinars; (1951) imports 12,108,000,000 dinars, exports 9,180,000,000 dinars. Main sources of imports (1951): U.S. 38%; German Federal Republic 11%; Italy 9%; U.K. 4%. Main destinations of exports: U.K. 18%; German Federal Republic 17%; U.S. 15%; Italy

12%. Main imports (1951): food 23%; machinery and vehicles 21%; textiles 18%; fuels 8%. Main exports: ores, metals and products 31%; timber and products 29%; agricultural products 25%.

Transport and Communications.—Roads (1950): 46,256 km., incl. 2,318 km. metalled. Licensed motor vehicles (Dec. 1950): cars 12,000, commercial 20,000. Railways (1949): 11,448 km.; freight traffic (1951) 8,700,000 ton-kilometres. Shipping (merchant vessels owned more than 100 gross tons, Dec. 1950): 126, total gross tonnage 222,825. Air transport (1949), home services (international services in parentheses): kilometres flown 564,125 (225,655); passengers carried 25,644 (1,564). Telephones (1949): 74,994 subscribers. Radio receiving set licences (Dec. 1949): 299,055.

Agriculture.—Main crops (metric tons, 1951): wheat 2,277,000; barley 359,000; oats 293,000; rye 277,000; maize 4,033,000; potatoes 1,621,000; sugar beets 1,902,000; tobacco (1950) 17,000; dry beans 113,000; cotton lint 4,000; hemp fibre 30,000; flax fibre 3,400; cottonseed 9,000; linseed 4,000; rapeseed 8,000; sunflower seed 94,000. Sugar, raw value (1951) 175,000 tons. Livestock (1951): cattle 4,730,000; sheep 10,274,000; goats (1950) 786,000; pigs 3,910,000; horses 1,095,000; asses 152,000; mules 32,000; chickens 14,980,000; ducks 789,000; geese 873,000. Wool production, greasy basis (1951) 10,000 metric tons. Wine production (1951) 5,160,000 hl.

Industry.—Manufacturing establishments (1948): 1,042, persons employed 254,000 wage earners and 74,300 salaried staff. Fuel and power (metric tons, 1951): coal 996,000; lignite 11,052,000; crude petroleum 156,000; electricity (1951) 2,544,000,000 kw.hr. Raw materials (metric tons, 1951): pig iron 262,800; crude steel 433,200; copper, smelter 32,400; lead, smelter 60,000; zinc, smelter 13,200; aluminum 2,900. Timber production (1950): sawn softwood 453,700 standards; sawn hardwood 635,900 cu.m. Manufactured goods (metric tons, 1951): cement 1,164,000; cotton yarn 26,900; wool yarn 13,400; woven cotton fabrics 122,800,000 sq.m.

Yukon Territory. The most northwesterly political division of Canada, the Yukon was created in 1908. Area: 207,076 sq.mi. Pop.: (1951) 9,096. Capital: Whitehorse; pop. (1951) 2,548.

History.—A new map of southeastern Yukon was issued in Aug. 1952; many of the lakes, mountains and creeks in the area were named after Canadians killed in action in World War II. Early in 1952, after a major military camp had been created at mile 165 on the Alaska highway south of the Yukon-Alaska boundary, the largest and longest military training exercise carried out in the Canadian north was conducted. It lasted six months, was called Exercise "Eager Beaver," and tested the abilities of Canadian and United States military engineers. Working under severe Arctic winter conditions and spring thaws, the troops tested equipment, airstrip construction methods, snow compaction problems, construction of field defenses, demolitions and cold weather administrative problems.

Education.—During the 1949-50 school year the Yukon territorial government maintained 10 schools, with 31 teachers and more than 700 pupils; the Indian affairs branch of the federal government maintained 7 schools, with 12 teachers and 234 pupils; the Roman Catholic church two separate schools with 4 teachers and 118 pupils.

Finance.—In the 1950-51 fiscal year the federal government collected revenue in the Yukon totalling \$1,846,793, and expended \$5,626,640 for administration and development.

Transportation.—Traffic during 1952 on the Alaska highway was double that of 1951. Canadian Pacific airlines operated frequent service from both Vancouver and Edmonton to Whitehorse and regular twice-weekly flights from Whitehorse to Mayo and Dawson. Pan-American World Airways provided service between Seattle and Whitehorse on the Seattle-Fairbanks flight. Traffic on the river system during 1951 involved 8.751 tons of freight and 4,821 passengers (1949: 22,696 tons, 8,713 passengers).

Furs.—Raw furs exported from the Yukon during the year ended July 31, 1951, totalled 228,616 pelts of which squirrel accounted for 145,355 pelts and muskrat 70,786. There were 2,663 beaver and 2,045 marten pelts.

Industry.—In Aug. 1952 the Aluminum Company of America announced plans to build a \$400,000,000 aluminum plant with an annual capacity of 200,000 tons in the Taiya valley near Skagway, Alaska, using water from five Yukon and British Columbian lakes and from the Yukon river to generate hydroelectric power. The Canadian government had not, by Oct. 31, 1952, made any official comment on the proposed project, which would involve a large dam on the Yukon below Whitehorse.

Minerals.—Mineral production for 1950 was valued at \$8,035,696, and included 93,339 fine oz. of gold (worth \$3,500,000), 3,202,779 fine oz. of silver (\$2,500,000), and 12,865,518 lb. of lead (\$1,900,000). In the year 1946 total mineral production was valued at \$1,700,000. (C. Cy.)

Total	1,400	1,550	1,760	1,870	2,000	2,140	2,350

United States.—Mine production increased by 8% in 1951 compared with 1950, and continued to advance in 1952, reaching a total of 460,444 tons in the first eight months. Smelter output was 566,730 tons in the first seven months of 1952, an increase of 4% over the same period of 1951, and shipments dropped to 491,712 tons, permitting appreciable additions to smelter stocks, especially in June and July. Consumption during this period was even lower, at 444,914 tons with a corresponding increase in consumer stocks. Imports through July totalled 261,610 tons in ore and 52,800 tons of slab zinc, while exports of slab zinc were 39,573 tons—all sharp advances over the 1951 rate.

Table II.—Data of Zinc Industry in the U.S.

(In thousands of short tons)

	1945	1946	1947	1948	1949	1950	1951

Zoology. Behaviour.—The revival of interest in behaviour and instincts of animals in recent years, especially in continental Europe, had led to much research and to sufficient distinctness in aim and method to mark out a special field of biology, namely, ethology. One of the most active investigators, N. Tinbergen, summarized much of the work in a book which was of interest to both amateur and professional biologists and psychologists. A single example of his approach to the study must suffice. What external stimulus or sign leads a male stickleback in breeding condition to assume the fighting posture—head in the sand and body vertical—when confronted with another male in the same condition? That the stimulus was visual could be shown by demonstrating that such a fish would react in a similar way to its own image in a mirror. Male sticklebacks during the breeding season (and only then) differ from females in being coloured red on the lower half of the body. Is the effective stimulus form or colour or both? It was shown that males did not react to accurate models of other males unless they had the red coloration. Furthermore crude, unfishlike models, if appropriately coloured, set off the fighting reaction.

ONE-HORNED INDIAN RHINOCEROS, captured in Assam, India, tossing in its pit trap before being transferred to a cage. Because the animals were comparatively rare in 1952, the government of Assam permitted only occasional hunting of them for zoos

Hence, it could be concluded that red colour properly placed in an object was the effective stimulus. Similar experiments on "recognition" were reported for moths and their mates and passerine birds and hawks, to mention only a few of the many examples that Tinbergen brought together.

Ecology.—Recent increases in knowledge of the biology of the oyster (fecundity, spawning, fertility, embryology, pelagic life, setting, growth, feeding and so on) were reviewed by P. Korringa. L. Bels reported the results of a 15-year program of banding bats in the Netherlands. More than 17,000 individuals of 14 species were banded either while hibernating in caves or when emerging from their nursing colonies. The most extensive migration recorded was by bats of the species *Nyctalus noctula*, which were recovered as far as 429 km. (286 mi.) from their place of birth. Members of the same species also set the record in homing experiments, returning to their home caves from a distance of 185 km. (115 mi.). As was expected, the percentage of bats recovered fell off with the passage of time. The maximal period of recovery was 13 years for *Myotis myotis* and 13½ years for *Rhinobolus ferrum-equinum*. This gives an indication of the longevity of these species, but obviously not the maximal attainable age.

Two characteristics commonly used in separating races and subspecies in fishes are the number of rays in the fins and the total number of vertebrae. A. Vedel Taning pointed out that such studies face hitherto unsuspected difficulties, for these numbers vary with the temperature during development of the young. His experiments showed that young sea trout developed the minimal number of vertebrae when they were kept at a temperature of 6° C. and a minimal number of fin rays at 8° to 10° C. In either case higher or lower temperatures brought about an increase in the number of these elements. He further showed that the most sensitive period—the time when these numbers were determined and the time when temperature was effective—was at an early stage shortly before the eyes were well developed. Temperature differences had little effect at other stages in early development, but an increase or decrease of 3° to 6° C. at the sensitive period led to an average increase of 1.5 in the number of vertebrae.

Embryology.—R. Briggs and T. J. King succeeded in transplanting living nucleuses from frog embryos in blastula or early gastrula stages to eggs from which the nucleuses had been removed—a notable technical achievement and one which opened up the possibility of many new experiments on the role of the nucleus in embryonic differentiation. More than half of the eggs with a substitute nucleus underwent cell division and some developed into normal tadpoles, thus showing that at least up to the early gastrula stage (several hundred cells) the nucleuses were still completely equivalent to one another and to the egg nucleus or, to express it differently, that the nucleuses had not become qualitatively different from one another.

Since the studies by W. Heape in 1890, it had been known that rabbit eggs could develop normally when transplanted to the uterus of a properly prepared nonpregnant doe (foster mother). Modern transportation made possible an extension of this technique that it was believed might have implications for agriculture and medicine. W. G. R. Marden and M. C. Chang reported that rabbit eggs, which were fertilized in Massachusetts, then removed from their mothers at an early stage, were shipped in thermos jugs by air and rail to Cambridge, Eng. The eggs were then transplanted to the uteri of foster mothers. Ten per cent of them underwent normal development and birth.

W. S. Bullough, studying isolated mammalian epidermis, showed that the rate of cell division (mitosis) was directly related to the amount of oxygen and energy-bearing compounds available. Further, energy was needed for the initiation of mito-

sis, but not for its completion. The process, once begun, continued even under adverse conditions of energy supply and thus was "a perfect example of an all-or-none reaction."

Monographs and Comprehensive Studies.—Under the editorship of M. Hartmann, comprehensive reviews of zoological research from 1944 to 1950 were prepared by specialists. The fields covered gave some indication of the structure of zoology: morphology, systematic zoology and evolution, comparative physiology, metabolism and energy exchange, developmental physiology and morphogenesis and ecology.

The most important modern encyclopaedic treatment of animals, edited by Pierre-P. Grassé, was continued by publication of part one of the first volume (the sixth volume in order of publication). The introduction was a masterly article on evolution by L. Cuénot, followed by the editor's treatment of all aspects of the modern study of the protozoa. Two groups of protozoa were considered, the flagellates and rhizopods (treated as one group, the *Rhizoflagellata*).

L. Gedda published a lavishly illustrated and compendious study of twinning in plants, animals and man. It took its place as the most comprehensive treatment of the subject. Its bibliography of more than 5,200 titles made it of value to specialists.

General.—L. von Bertalanffy published an important book on theoretical biology in which he further developed the organismic concept and extended his own general system theory. His treatment of organisms as open systems that maintain a steady state by constant expenditure of energy was of special interest to physicists and physiologists.

N. J. Berrill's beautifully written and authoritative *Journey Into Wonder* used the explorations of South America as a framework for natural history writing in the finest tradition of the genre. (See also ENDOCRINOLOGY; GENETICS; MARINE BIOLOGY; PALEONTOLOGY; PHYSIOLOGY.)

Zoological Parks.—The zoo in Pretoria, U. of S. Af., received from the Zululand reserve a female square-mouth rhinoceros as a mate for a male secured three years before; this was the first pair of the very rare southern race to be shown in captivity.

The Zoological Society of Antwerp, Belg., published, in French and English, Walter Van den Bergh's paper, *The Museum of Living Animals*, a valuable and concise prospectus on the founding, building and conducting of a zoological park. Architects for the zoo at Basle, Switz., designed a house for giraffe, which, in addition to the usual heated quarters and the adjoining outdoor paddock, had an intermediate unheated stall or corridor with skylights and glazed vertical walls on the paddock side in the manner of a portico. This solar heated enclosure was considerably larger and less expensive to build than the typical indoor stall, and could be used in all but the coldest weather. A new and beautifully landscaped zoo, open the year around, was constructed on the exhibition grounds at Naples, It. Additions to U.S. collections were meagre. The New Zealand government, however, presented each of the societies in New York, Brookfield, Ill., and San Diego, Calif., with a tuatara.

Axel Reventlow, Copenhagen, Den., was chosen as president of the International Union of Directors of Zoological Gardens; Frank McInnis, Royal Oak, Mich., was elected president of the American Association of Zoological Parks and Aquariums.

(Ro. B.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* in which the articles appear. For example "Lawn Bowling 53, 52, 51, 50" indicates that the article "Lawn Bowling" is to be found in the 1953 *Book of the Year*, the 1952 *Book of the Year*, the 1951 *Book of the Year* and the 1950 *Book of the Year*. The reference "Horses: see Livestock 53, 52, 51, 50. See Horses 49" indicates that information on "Horses" is to be found in the article "Livestock" in the 1953 *Book of the Year*, the 1952 *Book of the Year*, the 1951 *Book of the Year*, the 1950 *Book of the Year* and under the heading "Horses" in the 1949 *Book of the Year*. All black type entries without dates indicate that the same entries appear in all the past five issues. Examples, not Advertising 53, 52, 51, 50, 49, but Advertising; not Abyssinia: see Ethiopia 53, 52, 51, 50, 49, but Abyssinia: see Ethiopia.

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text not given a special article. Those which show page references refer to this issue only. Those which refer to the article **Obituaries** are followed by the date of issue in which the obituary appears.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
